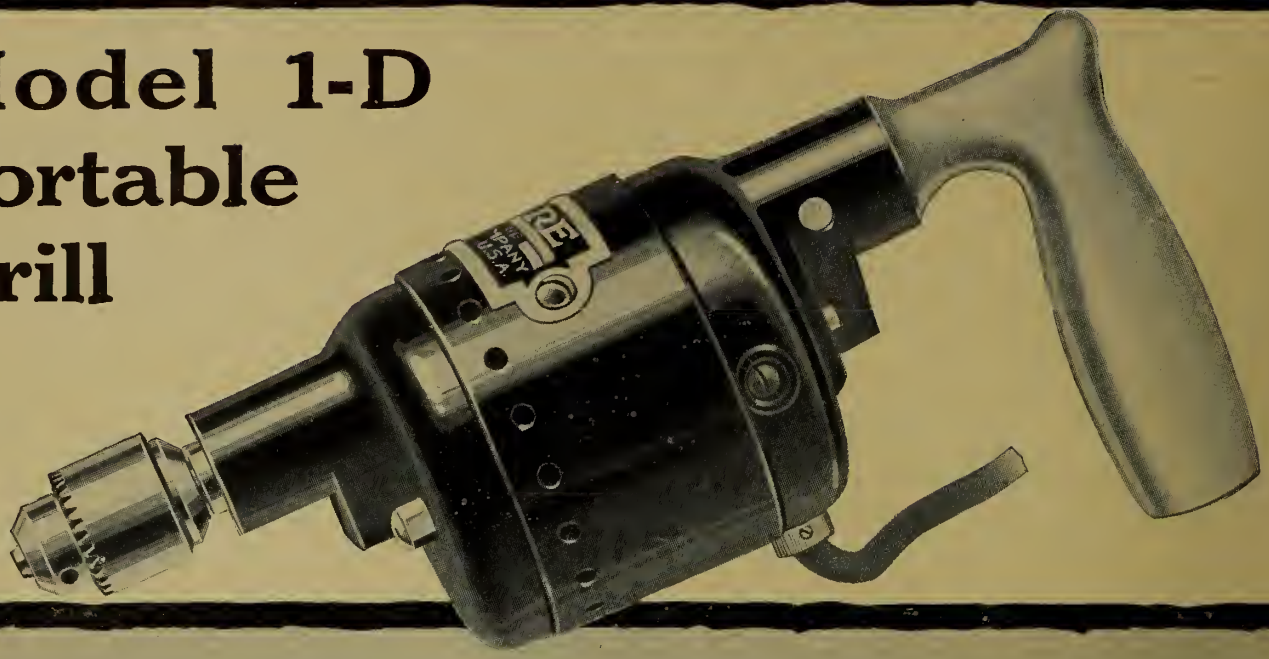
Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to 3/16". Wood and alloys, 0 to 1/4".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center 3/32".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

Save 25% to 50% of Blade Upkeep and Power Cost

Get Two, Even Three Times As Much Work

It's not the blades that wear out that cost, it's those that break.

It's the broken blades that cut down productive time and cost to repair and to replace.

Blade breakage is reduced to a minimum on Fay-Egan No. 50—36″ **Square Column "Lightning Line" Band Scroll Saws.**

The Fay-Egan "Knife Edge" Blade Tension, made on the principle of a fine laboratory balance scale, is so sensitive that it compensates for changes in atmospheric conditions—yet, so flexible, you can pass a block between blade and wheel, while running, without breaking the blade. Folks tell us blade expense on "No. 50" averages 50 to 75 per cent. less than on the old timers.

The solid lower wheel acts like the fly wheel on your engine, its momentum carrying the load, so that the power consumption is reduced fully one-half, while at the same time it controls the light-spoked upper one, preventing over-running and choking down on a heavy cut.

The heavy square column eliminates vibration and permits the wheels to be revolved at 50 to 100 per cent higher speed, increasing the cutting capacity to double, and in some cases, triple that of the ordinary band saw.

As a user of saws, you cannot afford to ignore what Fay-Egan Square Column Band Saws are doing for others and can do for you. An investigation does not obligate you.

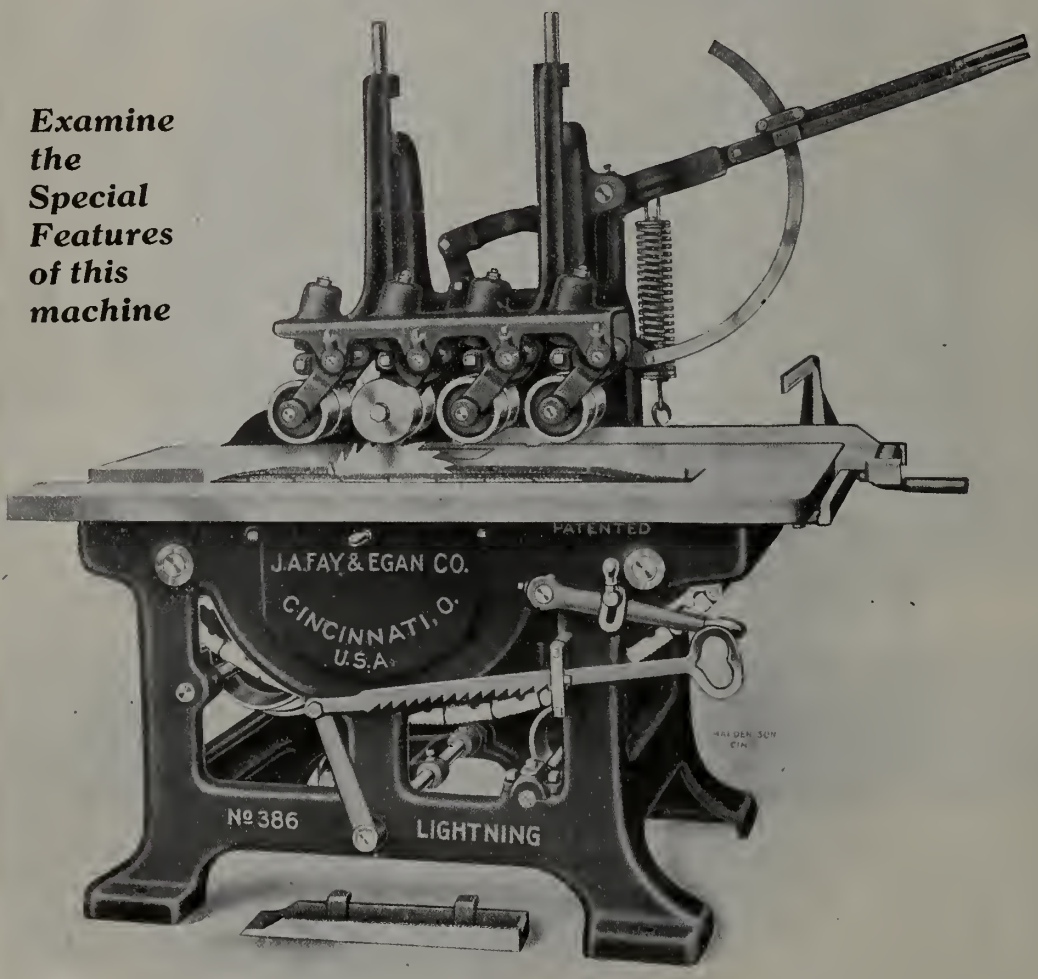
New Straight Edge Ripping and Jointing Machine

Makes perfect straight joint ready for glueing
Built in two sizes

Examine the Special Features of this machine



No. 386 Straight Edge Ripping and Jointing Machine

Prevents any twisting on either long or short stock.

Saw arbor easily accessible for oiling.

Double feed chain of flat milled links, each link removable and interchangeable.

Instantaneous adjustment of all rolls easily made and automatically locked at any point.

Spring counterbalance makes roll adjustment easy.

Saw blade easily accessible by removing plate.

Chain adjustable above table for rough, crooked, or finished stock.

Saves 33⅓ to 50 per cent. in Wages, 10 per cent. in lumber and also uses up your waste stock

NOTE—Saw cuts from below and all sawdust and slivers are drawn down and away from the saw and do not scatter over the work and get into the operator's eyes, ears, nose and mouth, as in the case where saw cuts from above.

Circulars fully describing this new machine will be gladly mailed to all interested parties

Jackson, Cochrane & Company

KITCHENER - CANADA

The "Shimer Limited" Expansion Head

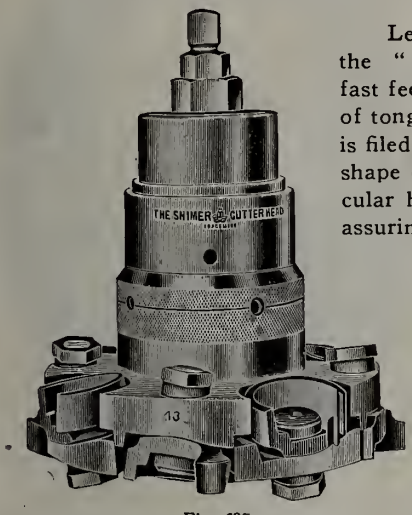


Fig. 627

Let us draw your attention to the advantages of using the "SHIMER CUTTER HEAD" for general Mill and fast feed Planer work. The Cutter is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The bit being circular has from 3½ in. to 5 in. cutting length to the cutter, assuring long wearing life to the cutters.

Note that the cutter, being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without the Self-Centering Sleeve, and made Expansion or Solid, to suit the customer's wishes.

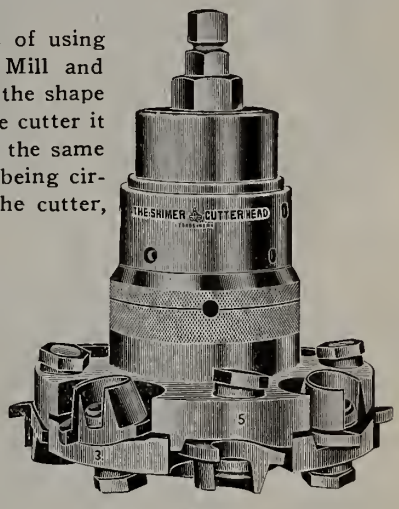

Fig. 268

Shimer Heads have been in use for sixty years, and their reliability and reputation have spoken for them in the past. Let us know your wants and we will guarantee their reliability at the present.

SHIMER CUTTER HEAD CO. OF CANADA, LIMITED

Successors to Samuel J. Shimer & Sons, Inc.

GALT, ONTARIO

BEAVER BEVEL WING GROOVERS

FOR CUTTING WITH OR ACROSS GRAIN

For general grooving on fine hardwood there is nothing equal to the bevel wing-type of groover saw illustrated above. It will cut equally smoothly either with or across grain and will not break out or tear. It can be used on shaper as well as on saw table.

Inventor and Designer of the World's most efficient Tubular Turning Machinery

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

W. S. HAWKER MFG. COMPANY

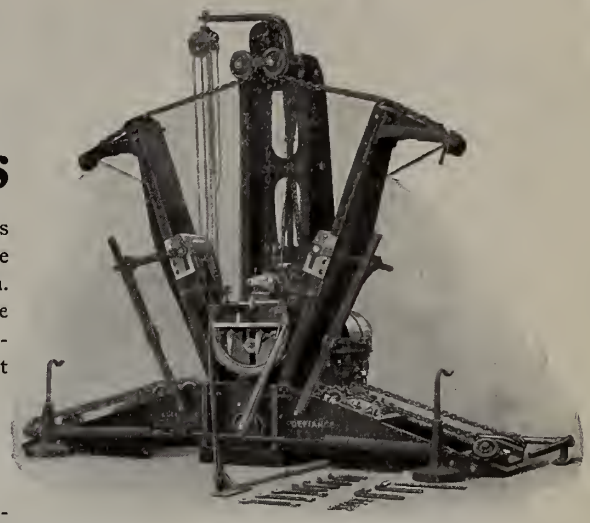
DAYTON, OHIO.

Why Struggle Along Continually With Obsolete Wood Bending Methods

when a little time spent investigating Defiance bending machines would lead to the salvage of your present material wastage—increase your present output, and reduce losses in breakage to a minimum. Defiance bending machinery is serving wood benders everywhere throughout the world. Its success, so pronounced and so long continued, proves Defiance methods of wood bending the most correct in use today.

DEFIANCE HIGH PRODUCTIVE WOOD BENDING MACHINERY

is built in various designs and sizes, and particularly adapted to bending rims for artillery wheels, automobile, auto-truck, wagon and carriage wheels, table rims, plow and truck handles, hames, bows for vehicle tops, and steering wheel rims. For the complete manufacture of the foregoing products many of the largest manufacturers all over the world are using Defiance equipment—all of which is a proven success and high productive machinery.



12″ Patent Rim, Felloe and Round Bending Machine

Illustrated and descriptive matter on your requirements in wood bending machinery will be mailed on request.

You Have Heard About Them, but do You Know what They Will do for You?

Construction of Chapman Double Ball Bearing in B Housing

For power economy Chapman Double Ball Bearings have proven far superior to any other make. The perfect surface of these bearings is only obtainable by the use of the highest grade steel thoroughly tested and manufactured into Chapman Double Ball Bearings by the hands of skilled workmen. For years

Chapman Double Ball Bearings

have been saving power and money to manufacturers and plant owners who have installed them in place of the power wasting, inefficient line shafting. You, too, can stop this leak in your costs immediately by equipping your plant with Chapman Double Ball Bearing—the bearings of no regrets. May we send you further particulars?

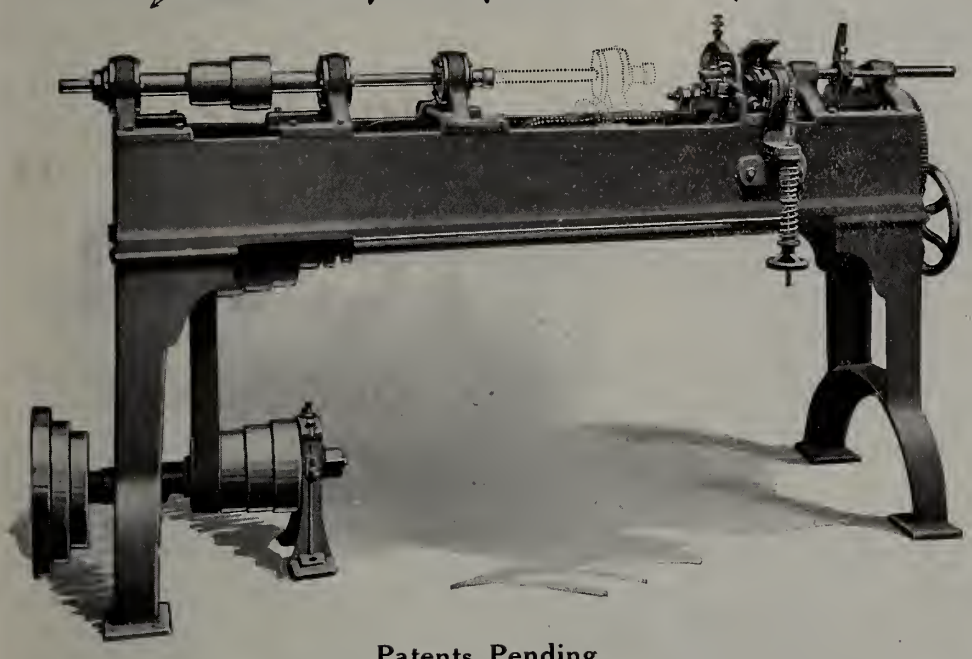
COWAN & CO. OF GALT LIMITED - Galt, Ontario

A Variety Turning Machine Such as You've Long Felt the Need of

What wouldn't you give for a variety turning machine in your plant—or several of them for that matter—so designed that all heating and mandrel troubles are eliminated; all friction on the wood, after it has been turned round with the roughing knife, done away with; in fact, all troubles overcome which retard operation? Such a machine is here—the new C. W. Smith.

S.K.F. Self Aligning Ball Bearings



Automatic Self-feeding Variety Turning Lathe

It is the result of many years' experience in the operation, development and manufacture of wood turning machines, and now constitutes a great forward step in this class of machinery.

The feeding device is so arranged that the feed can be changed by simply moving the belts from one cone to another, covering a range of 5 strokes to the minute, from 15 to 70.

Patents Pending

The swinging cutterhead moves in all directions as well as a circular motion, thus enabling the operator to set knives where they cut the wood at all times.

Cutters are made up 7-in. long, without slots, and will turn ten times as many pieces as slotted cutters and do the work much better.

All kinds of plain and fancy work can be turned, from the smallest item up to 1¾-in. diameter and 7-in. long, in all kinds of wood.

Full details of this machine are given in pamphlet No. B-42, free on request.

"Treat Your Machine as a Living Friend"

The Features Worthy of Special Notice

— construction of the wheels
— size and style of bearings
— convenient adjustment
— universal alignment of wheels
— steadiness in running
— mimimum saw-breakage

No. 132 "Preston" 36″ Band Saw

An Aim Accomplished

In the design and throughout every stage of construction it has been our aim to make the No. 132 "Preston" 36″ Band Saw just a little better than it was necessary. This, of course, is a vital factor in the success the machine has proven to be when it was put in constant use.

We could, of course, have gone ahead with our designs and patterns and produced a machine of ordinary merit. But we realized that in this plan we would have in the end a product very similar to many other band saws that were already on the market. We realized that there was a large demand for a machine that would give better results all around and we set about to produce one. And, we believe, we have been successful; at least they have given such general satisfaction to those who have purchased them that the owners themselves tell us they are wonders. This is our aim accomplished.

Let us send you our bulletin which gives a complete detailed description of the machine, together with its many advantages.

The Preston Woodworking Machinery Co. Limited

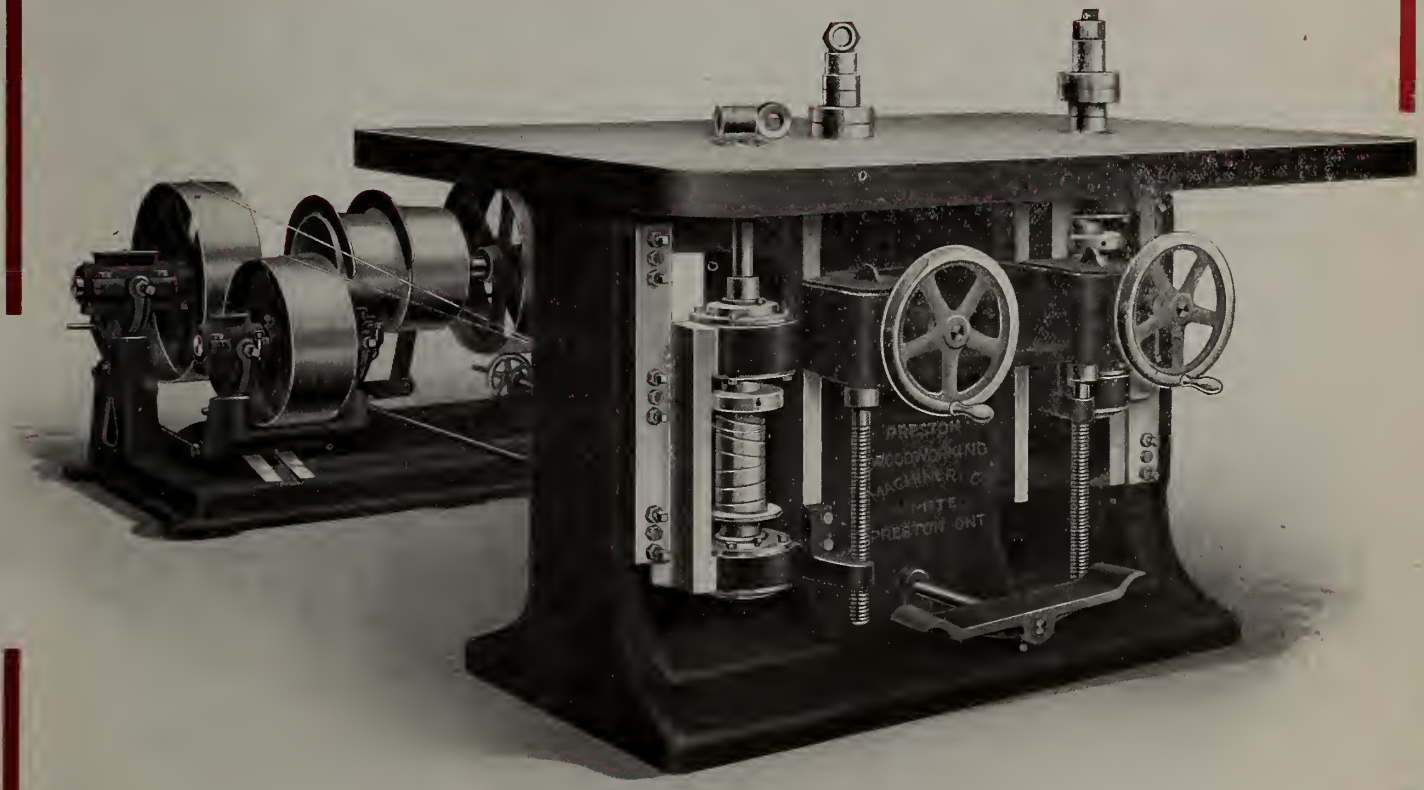
PRESTON, ONTARIO

You're Losing Money

every day you put off buying a

"PRESTON"

HIGH SPEED BALL BEARING SHAPER



WHY?

—because your operator can turn out more work in one day;
—because it will save you its entire cost in less than a year;
—because it takes less power to operate and will double your shaper production.

HERE ARE SOME OF ITS FEATURES:

SKF. Ball Bearings. *28" Spindle Centres*
Horse Power Required 3-HP. *Spindle Speed 7000 R.P.M.*
Weight 2750 lbs.

The Chevrolet Motor Co. are using 13 of these machines in their plant at Oshawa, Ont.

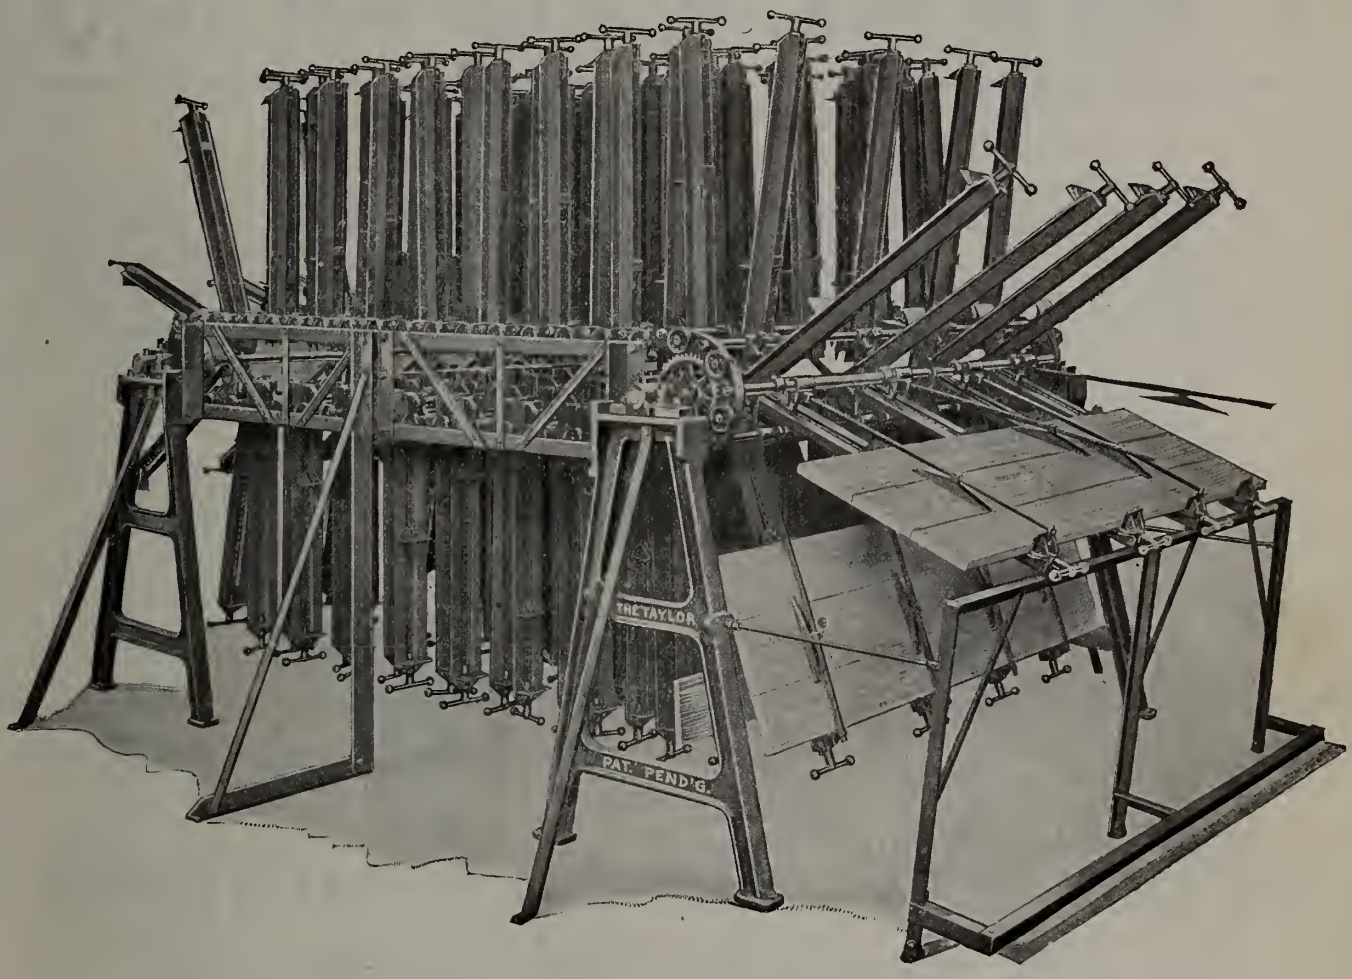
CLAMP The Taylor CARRIER

REG. U.S. PAT. OFF. TRADE MARK



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

REASONABLE PRICES—that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect.
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

RED GUM

"AMERICA'S FINEST CABINET WOOD"

The really successful merchant, it matters not in what line, is he who takes the trouble to ascertain

WHAT THE PUBLIC WANTS

This is especially true in its application to the furniture manufacturer and his retailer. He *has to* study his public—or he soon will have no public.

That portion of his public which is influenced by the principles of good taste wants RED GUM furniture—Why? Because the color, grain and soft, velvety quality of this, the finest of America's cabinet woods, when handled by a master cabinet-maker, results in a thoroughly charming piece of furniture—the kind that people of nice discrimination like to have around—and want strongly enough to *ask for*. Then can YOU supply it?

Makers and dealers desiring to see samples of RED GUM, both rough and finished, are invited to correspond with us at once.

ADDRESS: RED GUM DIVISION

Our Service Yard
is maintained for SERVICE

We have the lumber—but more than that we can get it to you **quickly.** Orders that come into this office are shot out of our Logansport (Indiana) Yard at top speed. This is merely one mark of the efficient service that is shown all our customers.

Nothing but the best quality stock ever leaves our Logansport Yard. The fact that we invite inspection there means that our customers **must be satisfied.**

IOWA WALNUT

The War Brought It Out

The absolute insistence of our Government upon American Black Walnut for gunstocks (and for aeroplane propellers to the limit of our capacity) developed the fact that the amount of American Walnut still available is more than ample for our domestic uses of several generations to come!

Its qualities are so incomparable among all hardwoods that it is no wonder that Walnut is classed as the supreme cabinet wood of the world. If you inspect the palaces and museums of Europe and America you will get quite an awakening—and you will then be glad that Walnut is still plentiful and that you can secure your supply—and at most reasonable prices.

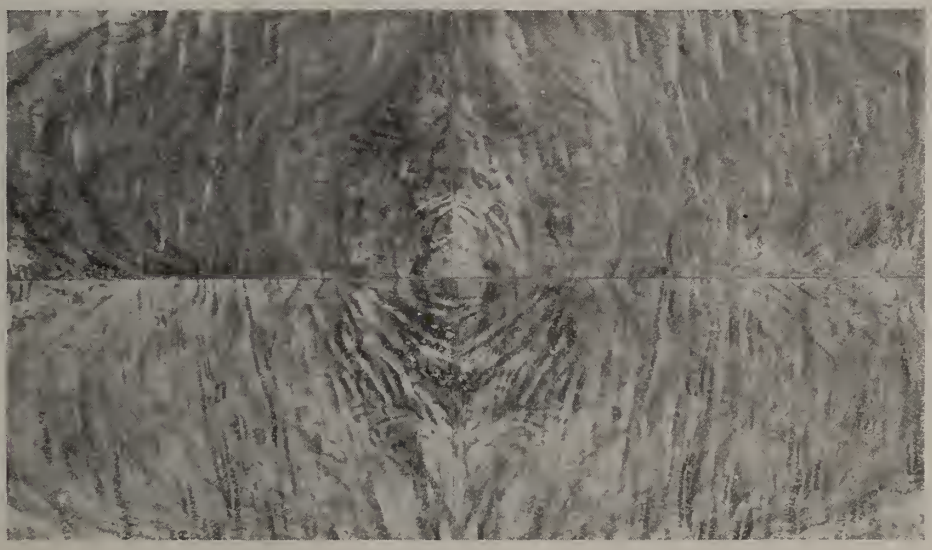
Send us a list of your needs.

Des Moines Sawmill Co.

DES MOINES, IOWA

"Hartzell" Lumber and Veneers "Hartzell"

American Walnut Exclusively



"Hartzell's Choice Walnut"

Furniture manufacturers will do well to note that we produce only American Walnut, and therefore can be classed as the logical source of supply in this wood, and our years of experience in handling American Walnut will prove valuable to you if you desire to take advantage of it.

By saying that our long experience will prove advantageous to you we mean that you should by all means take time to examine our line before purchasing, because the quality will be far superior to the average line and the price no greater.

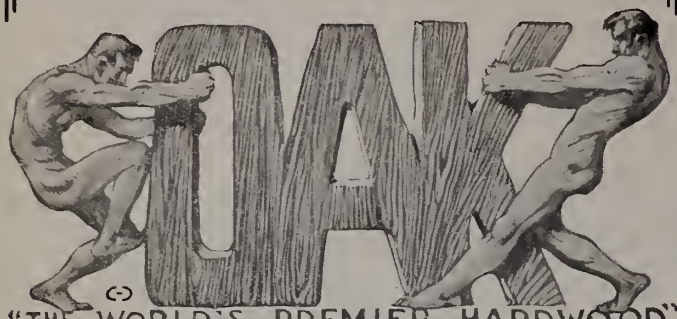
We study your particular interests and produce veneer of the kind and quality that is best adapted to your work, and whatever class of figure you are using we can give you a complete uniform line of just the wood you want for your selection, and it will not be necessary for you to handle a great lot of all sorts of samples and then find only a few stocks suitable for your needs.

When you purchase our line you can rest assured that you can duplicate your purchase just as near as it is possible to do so in Veneers, that is our part in serving you and we see to it that you are served right.

"SEND YOUR INQUIRIES FOR VENEERS TO US."

"Hartzell" Piqua, Ohio "Hartzell"

"YES!" IS THE WORD FOR AMERICAN **OAK** TODAY!



"THE WORLD'S PREMIER HARDWOOD"

to ***ALERT FURNITURE MAKERS: "A WHISPER IS ENOUGH"***

From FILING CABINETS and other Office Furniture to "the bones of great ships"—OAK is **OAK.** (Supreme.)

From ***DELICATELY CARVED FURNITURE*** for the ***DILETTANTE TASTE*** to the sills and ribs of great structures whose nobility is in their sheer strength (and to the historic beams of Westminster Abbey) OAK is **OAK.** (Supreme.) ***GOOD* OAK FURNITURE is "COMING *IN*."**

Without a rival, without an apology, without a substitute, OAK is indeed

"*The* WORLD'S PREMIER HARDWOOD"

(has been, is and ever shall be), AND EVERYBODY KNOWS IT.

Nature will never grow another wood as good as OAK for the uses for which it is historically appropriate.

No need to mention Economy—*you know it.*

AMERICAN OAK is PLENTIFUL, ECONOMICAL, INDISPENSABLE.

ADMIRE IT. TRUST IT. INSIST ON IT. ***SPECIFY*** *IT. USE IT.* WRITE us. TELL us. ASK us. *We will give you a Straight Personal Letter in prompt reply—WITH ALL THE FACTS.*

The Canadian Wood Turpentine – made at our mills at La Tuque, P.Q. is an excellent diluent and solvent and contains no free rosin —

This Turpentine is made by an improved laboratory process from Canadian wood and its distinctive odor clearly indicates that it is a different product from that given by the older methods of distillation —

Further information gladly furnished upon request

A New Step in Technical Training

Practically all industries are at present confronted with a shortage of skilled help. This dearth of trained mechanics may be more marked in certain lines but cannot be said to be confined to any one trade or any one locality. It is a general condition that must be faced by all employers including those engaged in the woodworking industry.

It is not necessary to discuss the various causes to which this state of affairs may be attributed but one contributing factor is the fact that the younger boys are not entering the different plants and learning the trade from the ground up, as they were wont to do in former years. If the younger generation cannot be induced to thoroughly master a certain trade or calling it is hard to see where the mechanics of the next decade are coming from or what class of workmen will man our machines in years to come.

Many have hailed the technical school and the growing popularity of technical education as the signs which point to a solution of this problem. In the technical classes being held in various schools the boys are being grounded in mechanics and given a certain amount of practical training. This instruction not only educates the boy along practical lines but arouses in him a liking and inclination for things practical.

There are those who maintain that the manual training classes and other technical departments are not fulfilling their true mission. That instead of teaching the pupil to make boxes and other simple articles, they should work on commercial articles such as are being produced in our factories. Working thus the boy would become familiar with articles in common use and by conducting the classes along the lines followed in the factories he would gain an intimate insight into factory work and would naturally look for employment in a manufacturing plant when his course was finished.

The aims and limitations of modern technical training were clearly outlined in articles which appeared in the July and August issues of this journal. The object of these schools is not merely to turn out a certain number of skilled workmen but rather to turn out boys who, in addition to having received a grounding in mechanics, are able to take their place as citizens and hold their own in a competitive business world where a good education is necessary.

It has been suggested that the technical schools could better fulfill their purpose if the different manufacturers and other employers of skilled labor would co-operate with the authorities and work out a scheme whereby those who desired could spend part of their time in school and part working in the various plants and thus gain an insight into the methods and demands of our modern industrial life.

Beginning with the opening of the present term the industrial committee of the board of education of Chatham, Ontario, acting in conjunction with the chamber of commerce and the heads of several local factories, have adopted a scheme whereby the boys will study for one week in school and work the next in a factory, alternating from week to week during the term. It is hoped that in this way the boys will receive a thorough theoretical and practical training. This is a move that should be closely watched by all who are in the market for skilled labor. If the idea is a good one and it works out successfully, as it undoubtedly will, it could be applied to other schools.

This is not a new idea but one that has been in successful operation in a number of schools in the United States. An article describing the methods followed in one American school and the results achieved will be found elsewhere in this issue.

Lumber Situation Reviewed

As far as the lumber situation is concerned the year 1920 does not begin as auspiciously as did its predecessor. At the present writing lumber stocks are low and broken and prices on many items are slowly but steadily advancing. A combination of circumstances, beyond the control of the lumber manufacturers, tends for low production, so that it will probably be some time before there is any marked improvement in the hardwood lumber field.

Elsewhere in this issue will be found an article reviewing the trend of the lumber market for the past year and giving the stock on hand at the beginning of 1919 as compared with present holdings. The increase in prices which took place in the different woods and grades are included, together with the latest quotations from the Chicago lumber markets.

Saddle seat arm chair.

Demands of the British Market

An undoubted market exists for various forms of furniture and woodenware—Mr. Kaufman, who recently returned from England, outlines some of the requirements of this trade—Standardized lines in plain designs needed to successfully satisfy the British buyers.

By F. Kaufman.

Plain pad seat chair.

Readers of the "Canadian Woodworker" may be interested in my impressions of the British market, gained while on a trip to the "old country."

During my four months' visit in Great Britain I was astounded at the high prices and scarcity of furniture which I found to exist there. This condition is only natural when one considers that for almost four years the manufacture of this commodity was on the prohibited list. Since furniture manufacturing has been resumed it seems almost impossible to cope with the demand, and the people are paying fabulous prices to obtain their requirements. Taking all things into consideration it is my opinion that there are wonderful possibilities in Britain if any Canadian manufacturer cares to go after the export furniture trade. It may be said that our manufacturers in their usual efficient manner can do a tremendous business, but I suppose it takes them all their time to look after the Canadian trade. If there are any who contemulate trying to secure some of this business I would say "Now is the time," especially when one considers that the market is improving, both with regard to prices and shipments.

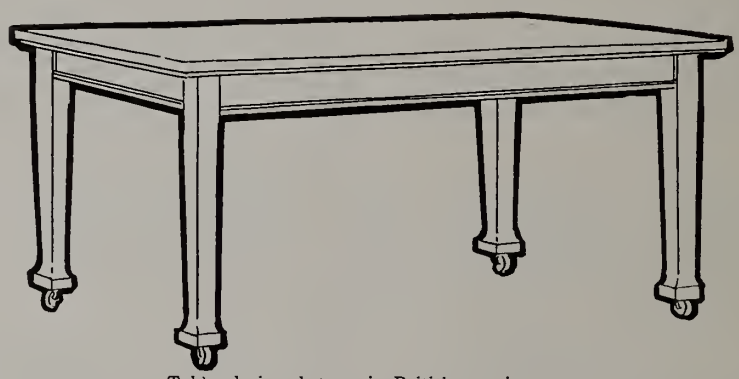

Table designed to suit British requirements.

At the present time the American furniture men are trying to obtain all the business they possibly can. In the office furniture field they have firmly established themselves in the English markets, but I cannot see any reason why our own manufacturers cannot do the same.

The articles of furniture and woodenware that are in demand are what may be termed necessities, not luxuries. What is required is strictly utility furniture. It is necessary to supply what the dealer wants and not what you would like to ship. All contracts must be fulfilled to the minutest detail. Although England is in need of these articles, the British market must not be considered a dumping ground for goods that will not sell.

In catering to an overseas trade in furniture it would be advisable to do business with one first-class wholesale importer or to open a permanent show room and warehouse, with a good selection of samples, under the management of a good, live agent. It is not advisable to depend upon selling from photos, for the people require to see the goods and to be sure of quick deliveries, which would follow if a stock were carried there.

The chief articles of furniture that should find a ready sale, and which could be manufactured economically and profitably are,—office furniture, such as desks, office tables, office chairs, office stools, filing cabinets, etc., and household furniture made in plain oak and finished in fumed, together with wood beds having iron side-rails, also dining-room chairs, dining tables, bedroom chairs, kitchen tables, dressers, chiffoniers, and kitchen chairs in hardwood.

To be suitable for importing the furniture would have to be simple in design and construction so that it could be made economically and in quantities. It is necessary that it be shipped knocked-down, so as to take up the least possible space when packed, and above all it should be standardized. As many pieces as possible, such as tops, frames, rails, gables, post-legs, glass-rails, etc., should be standardized, so that these pieces would be interchangeable as they appear in various articles.

Woodenware, such as chopping boards, rolling pins, clothes-racks, etc., mouldings of all descriptions, in fact practically any article that is useful and can be readily packed is bound to meet a ready sale. I believe that any manufacturer catering to the overseas market would find an almost unlimited demand for his wares. To my mind the possibilities latent in an export trade between Canada and Britain are greater than most people imagine. Is this immense trade going to go to the American manufacturers and others who are alive to its real value?

The accompanying illustrations, showing a dining table and suitable chairs, together with a few pieces of bedroom furniture, indicate a type of furniture that should take well on the British market. These pieces are simple in design and could be produced in quan-

tities at a price that should prove attractive. The lines are nearly all straight and time consuming scrolls and carvings are entirely eliminated. While there is a ready market for the better grades of furniture in the various period designs the greatest need is for plain furniture for the middle and working class homes. This is the grade that the Canadian producer is best equipped to supply and is the style that can be packed and shipped to best advantage, especially under present conditions.

Outlines British Piano Market

The American Consul in Liverpool recently investigated the market for pianos, and reports as follows:

There is a good market for pianos and player pianos in Liverpool, but American manufacturers would meet with keen competition and would doubtless find themselves to be laboring under a heavy handicap.

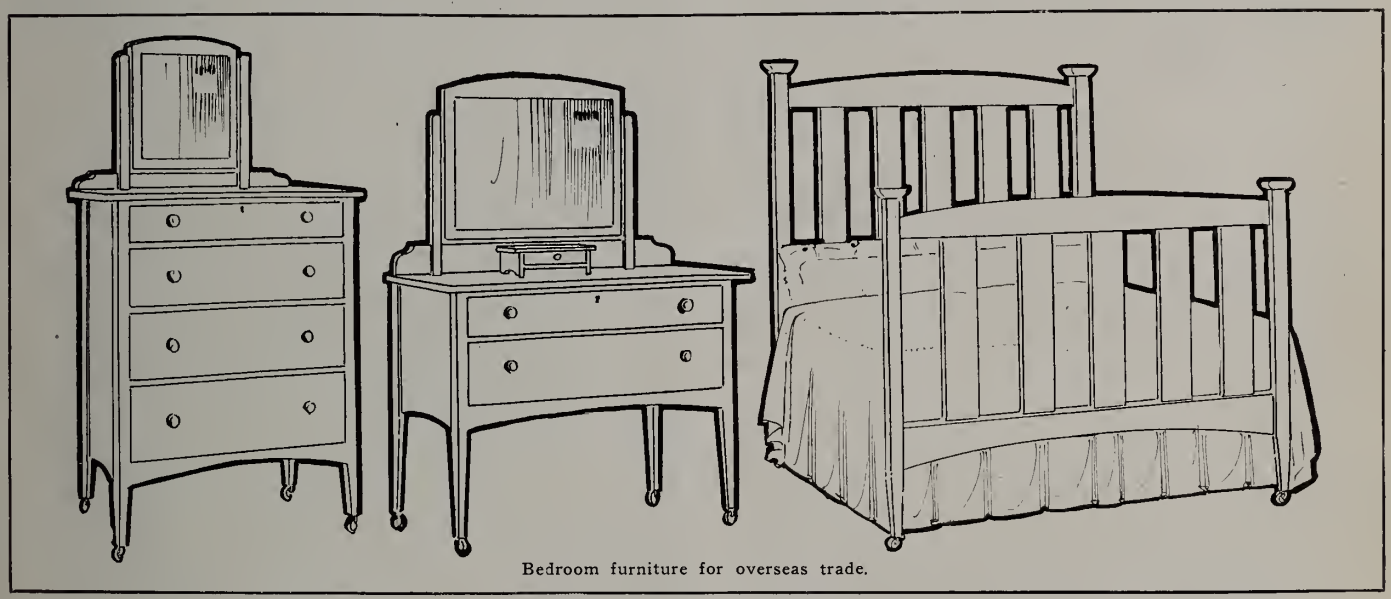
Prior to the war most of the pianos sold in this city were English, and nearly all the imported instruments were German. Manufacturers of the latter country sent over representatives, who studied the requirements of the English market and produced in accordance therewith a good piano, moderate in price, but not intended to last over twenty years. This type of German-made piano soon occupied first place in the local trade among the cheaper grades, English pianos somewhat higher in price being no better in tone and finish, and excelling in lasting qualities only.

During the war the market was entirely in the hands of British manufacturers, but now, with the lifting of trade restrictions, outside competition will again become severe. German manufacturers are taking active steps for the sale of their pianos here, and it is stated that already arrangements have been made for the shipment of 4,000 pianos form Germany to England.

The present range of retail prices for pianos is 150 to 450 dollars. Before the war a good German-made piano sold here for 125 to 150 dollars. Owing to the shortage of materials, particularly wood, together with the higher rate of wages being paid and shorter hours worked, the cost of production of British pianos is increasing heavily.

There is a duty of 33 1/3 per cent. on the c.i.f. value of pianos coming from foreign countries, and this, together with the present rate of exchange, would make it very difficult for American manufacturers to compete here. The duty is less of an obstacle to German makers who are selling in marks, from which a great advantage is secured by English buyers. Under the calonial preference scheme pianos from British colonies and Dominions would pay two-thirds the regular rate of duty, but imports from these are not yet a factor in the piano trade.

American-made pianos are so little known in Liverpool that it is difficult to determine just how they would be regarded. One primary consideration, however, is that American cases are, in many instances, too large and little suited to the average English house, the rooms of which are smaller than in American houses. The popular size for upright pianos in this country is from 4 ft. to 4 ft. 4 in. The cases most in demand are mahogany and rosewood, French finished, plain, or with very little decoration. By some dealers it is stated that tonal qualities of American pianos do not suit this market.



Bedroom furniture for overseas trade.

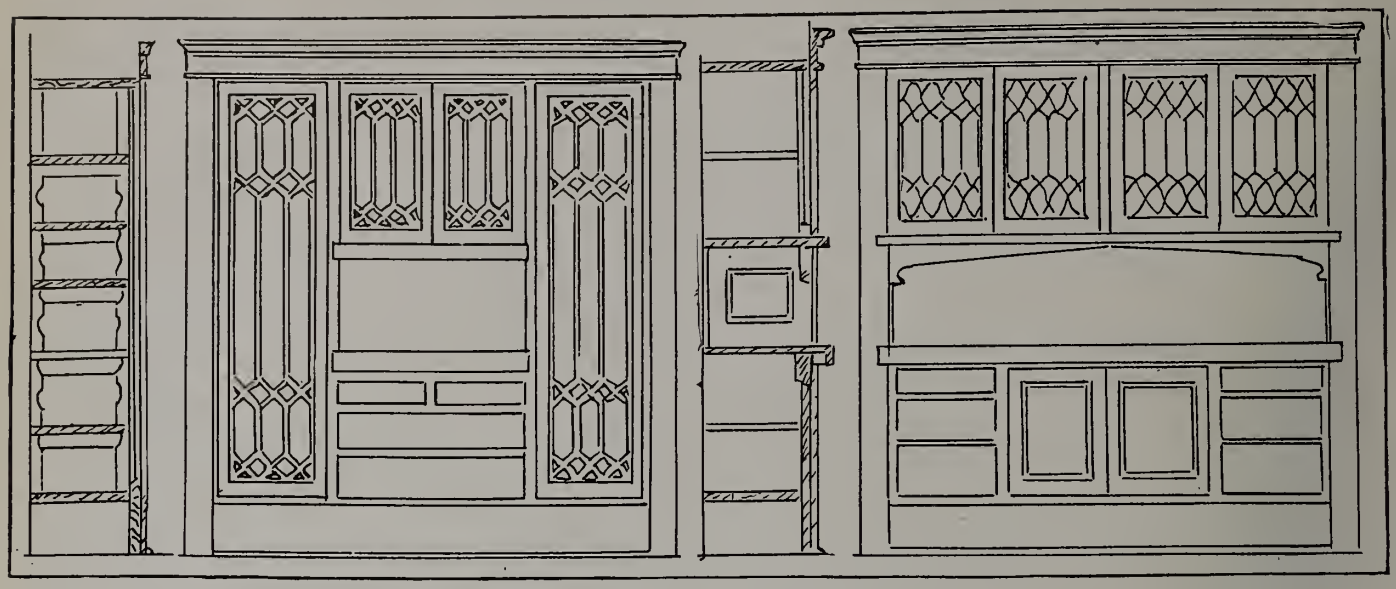
Woodstock—Brunswick Agreement

The agreement between the City of Woodstock, Ont., and the Brunswick Canadian Products Co., Limited, calls for the Brunswick Co. to erect a factory with a floor space of 125,000 feet and at a cost of not less than $200,000, including equipment. When the plant is complete the city agrees to donate the site, 10 acres, which cost $22,000, as a bonus, and, in addition, to advance the sum of $50,000 cash, as a loan, to be repaid either in money, with interest, or to be satisfied with the employment of not less than 200 employees for a period of ten years.

For each hour's employment given by the company to an employee in Woodstock, the Company shall have accounted for 1¼ cents on such loan, provided that if the amount so accounted for in any one year is less than $5,000, the difference, with interest, shall be made up in cash by the company. In other words, the employment of a certain number of hands for a ten-year period will completely satisfy the $50,000 loan.

In addition, a fixed assessment of $50,000 for ten years is provided for.

years is provided for. The by-law, to this effect, was carried by a good majority.



Saving Space in Constructing a Home

Built-in Buffets Increase Attractiveness of Room and Prove an Added Convenience—Old Doorway Converted into Useful Cabinet

By W. H. Shaw

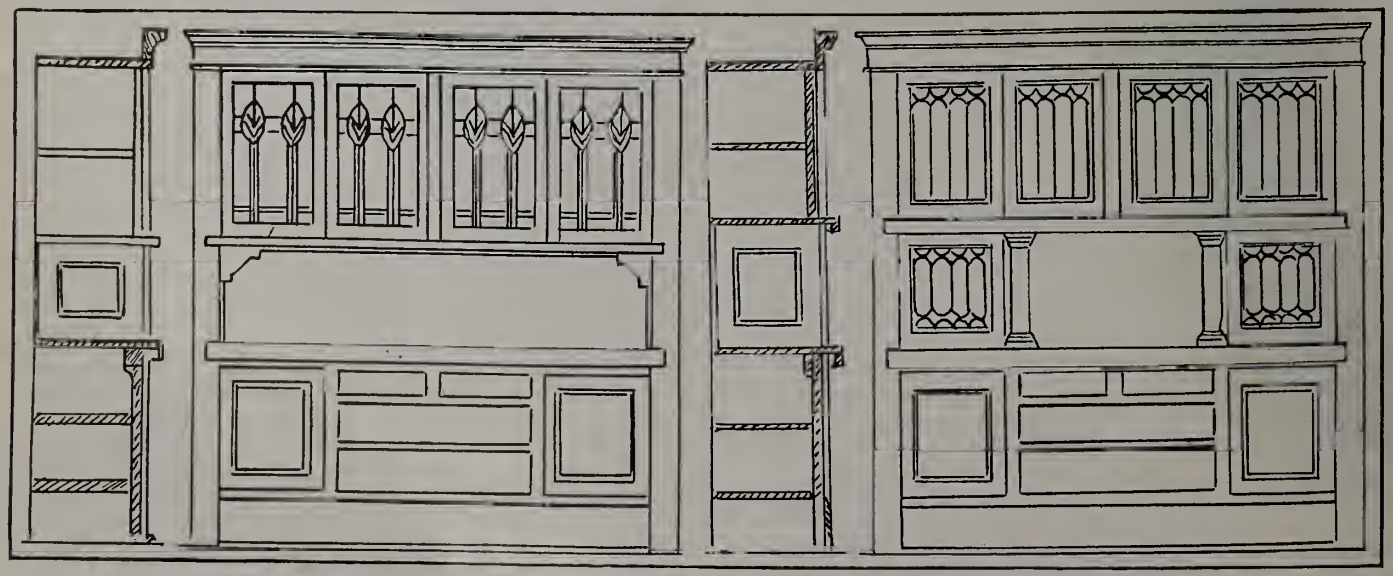
During the twenty four months preceeding the ending of the war, when individuals were practically prohibited from erecting new buildings, our Government, Munition Board, and large corporations doing war work carried on house building operations on a gigantic scale, many hundreds of houses having been built for the employees of shipbuilding and munition plants.

A study of these houses reveals many valuable lessons, the chief of which is found in the startling discovery that families may be perfectly comfortable and contented in houses of much smaller dimensions than was ever before thought possible. By this I do not mean the haphazard slicing off of room sizes, or storey height, or the omission of rooms, closets, or passage ways, where such compartments are necessary to the comfort of the occupants, but instead I refer to the intelligent reduction of sizes in all cases where such a saving is found possible, and the utilizing of all other known features of economic planning.

The small house, developed to meet war emergency needs, has became the new idea in home building. Its many adaptations in present building plans reflect the work of some of the best architects in the country, men who have given their experience to the designing and erecting of numerous low-cost houses.

The house with many built-in features usually makes especial provision for my lady's dishes, which will at the same time make an interesting display of the china, and give it special protection. Where ever it is practicle china cupboards or buffets are built into the wall. Such a cupboard will not gather dust, and is less in the way than one which projects into the room. At the same time, a sideboard which projects beyond the wall on the outside, unless it is given good insulation makes a cold wall.

In severe weather it is often found that a very considerable amount of cold is driven into the room from around a projecting sideboard bay. On further investigation it is often found that the speculative



Attractive designs for built-in buffets.

builder, since he did not expect to live in the house and it "would not show" when the house was completed, omitted plastering and all other insulation, setting the built-in buffet just as it came from the mill, against the unplastered outside wall of the house.

Of course, it is cold. The wind blows right through the brick or clapboard and sheeting into the drawers, and so on through into the room. When the house is building it is well to examine the construction before the buffet, cupboard and pantry fixtures are put into place.

The buffet if possible should never project into the room, nor outside the wall. A window seat on either side if possible fills the depth of the linen drawers, while as they are usually built the cupboard above is shallower. Dishes are apt to be broken if cupboards are built so deep that pieces must be lifted past those in front.

This is really a clever arrangement as the sideboard and seats do not diminish the service space of the room any more than the piece projecting into the room would do.

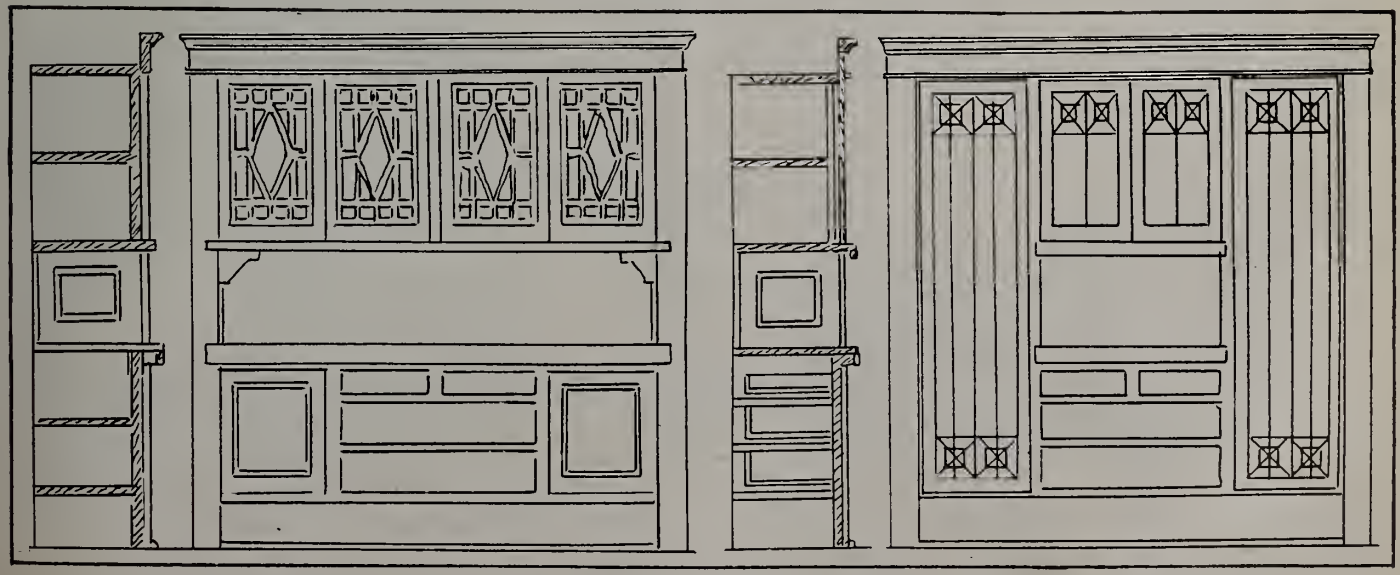
If the cupboards are not built-in there are often corners and small waste spaces where room may be found and a shallow cupboard constructed.

The depth of the cupboard is fixed by the largest size of plates which are to be put into them. Twelve inches is usually considered ample. Six inches more than the thickness of the wall, which is cut through, will in this way give room for a china cupboard or buffet.

Another suggestion is a cupboard built in an old door opening. The opening and trim remaining the same, just a little more than the width of the partition will give space for china. The drawers underneath should be deeper if they are to be really useful for table linen, as the housewife will tell you that the table cloths will look better if they do not show too many folds. Special table linen drawers are made long enough to take half or at least a quarter of the width of the widest cloth.

At least one drawer should be from thirty to forty inches to accomodate table linen.

These built-in buffets are made in an almost endless variety of styles and sizes. The wood should be the same as the trim of the dining room. The height should be the same as that of the doors and the frieze corresponds with the head casings of the doors and windows. The picture moulding of the room is carried entirely around and forms a crown moulding to the buffet as well as to the door and window head casings.



Alternate designs and sections of built-in buffets.

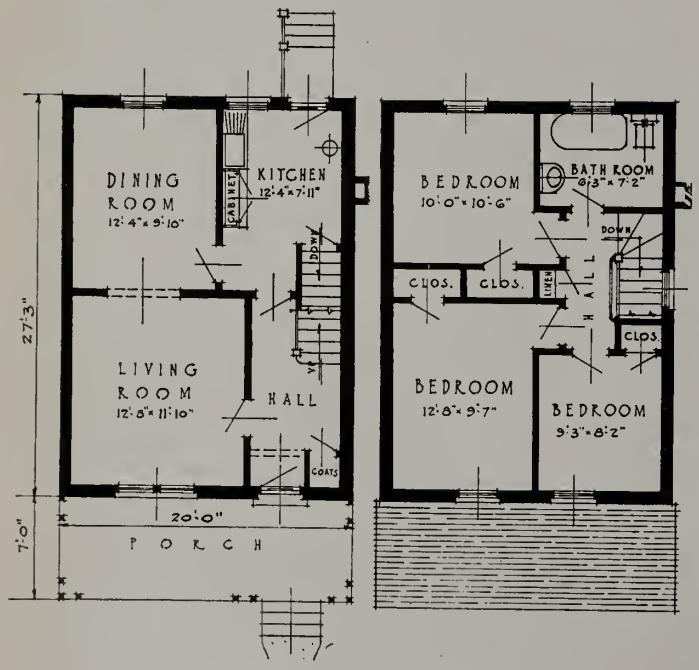
Pointers in Home Building

Many Attractive Features in Designs of Houses Adopted by Leaside Housing Commission

The front elevation and floor plans which accompany this article are from designs by William Lyon Somerville and illustrate the type of home adopted by the Leaside Housing Commission for their building scheme.

The floor plans are worthy of close study as they



Floor plan of detached house.

embody the latest ideas in the design of homes for those of moderate means. Attention might be called to the total areas of bedroom space as compared to the total area of the first floor. This means that without sacrificing comfort or convenience all waste space has been eliminated and a maximum amount of room given over to sleeping quarters. As will be noticed, the upper hall is only large enough to give access to the different rooms and closets.

The ground floor is conveniently laid out. A direct passage gives access to the kitchen, from the front entrance, without having to pass through the living and dining rooms. This is not only convenient but gives the lady of the house a better chance to keep these rooms spick and span. The kitchen contains a built-in cabinet and the sink is placed close to a window, thus insuring a maximum light. The closet just inside the front entrance, will be found very convenient for coats, hats, rubbers, etc.

The houses are finished in stucco and attention might well be called to one important feature. Exposed woodwork that is painted is a continual bill of expense as to prolong the life of such work, and maintain the appearance of the house, frequent coats of paint are necesary. To eliminate this expense the amount of exposed woodwork has been reduced to a minimum. The overhang of the roof has been cut down and very little woodwork is shown around the window and door frames, a very narrow casing being used. Then it is the intention to stain all exposed wood. A good stain, properly applied, lasts for, approximately, twenty years.

Tenders were called on these plans last fall and the bids submitted varied from $2,500. to $2,755. for the semi-detached houses, and from $2,800. to $3,000. for the detached. As building costs have advanced since that date, it would cost considerably more to erect these homes to-day.

Dining suite manufactured by the Strathroy Furniture Co., Limited, Strathroy, Ont.

Ford's System Applied to Furniture Making

Work Done in Units—Unit Constitutes Day's Work—Gives Maximum Turnover per Man—Output 150 Suites Daily

Henry Ford's scheme applied to furniture manufacturing—that, in a nutshell, is the Stout Furniture Company's solution of the production problem, says a writer in the Furniture Maufacturer and Advertiser.

In the first place, it must be borne in mind that the Stout line is not "cheap stuff." It is walnut and mahogany, with a good three coat varnish finish. It is not the highest quality line on the market—but a little better than the "medium grades." (Four pieces sell for a bit over $200, and we venture to say that with ordinary methods of production, the cost would be well over $320.)

The line is short—two suits only. Standard walnut and standard mahogany finishes are used exclusively, though an ivory line was recently produced. As it slowed down production three days, it has been discontinued. The most popular suit is the Queen Anne. The other is an attractive Louis XVI.

The basement of this model factory is used for storage; the first floor machine operations, assembling and staining; the second, finishing, and the third, packing. Then the goods are taken down to the shipping rooms, and it might be said in passing, that the elevator shafts and the stairways are on the outside of the building, thus giving unobstructed rectangles within the four walls.

Work Turned Out in Units

In order to understand the manufacturing operations, the "Stout Plan" must be thoroughly comprehended. In general terms, it is as follows: Two shifts of 75 operatives each, making a total producing force of 150 persons, turn out 75 crated pieces each shift, or a total of 150 pieces each day. It takes 12½ days for the lumber to pass from the kiln to the crate —from the raw material to the finished product. The work is done in units, that is, the cut-off sawyer, as a part of the first unit, has an empty space to start with. He cuts just enough stock for 75 pieces of goods, thus completing his allotment. This stock passes to another machine in the first unit, and when the work on the 75 pieces in that unit is finished, the operatives go home. All along the line ahead this process is repeated.

Each unit contains just enough machines and operatives to turn out of their particular unit just 75 pieces. At the end of the shift, this material is moved up into the next unit, thus crowding into the cars 75 finished cases, and leaving a clear space for the following cut-off sawyer. This does not mean that each machine is a unit, but that the work is grouped in units—there being three only in the machine room with its many operations, and 29 in the entire system. If a third shift is added—and the way has been paved for it by cutting the hours on a shift from nine, up to November 10, to seven and one half now—the time consumed on one batch, except for the varnish drying, will be lessened, and the production will increase from 150 pieces a day to 225.

Each Shift Completes Unit

As stated, when the operations in a unit have been finished, the workers go home, since a figure is set and no overproduction of pieces is desired. If the unit is not cleaned in seven and one-half hours, the next shift carries on the laggard work and cleans it up in addition to its own allotment, and, since practically all is piece work, this unfinished work is welcomed because of the additional pay it brings. But the division of labor has been so carefully worked out, that uncleaned units seldom exist when the whistle blows.

Work is started by the first shift at six a. m., and the second shift finishes at 10 p. m. If an operation has not been completed by the end of the first shift, the worker continues until the second shift man arrives to take the work up—no let-up on unfinished work is allowed. The first shift works until 2 p. m., with one-half hour for lunch, and the second starts at 2 p. m. and has one-half hour off in the evening.

System Works to Advantage

This is, in a general way, the "Stout Plan." It works with perfection in their plant. There is absolutely no "back-tracking"—the lumber goes from the kiln to the crate without retracing a single foot—and this is one secret of the success of the organization.

The plant is modern in every respect. When the visitor sees it he is at once impressed by its cleanliness and efficient lighting. Large windows on both sides give excellent light and clean whitewashed walls and ceilings add much to the cheerfulness of the plant. For the height of about six feet above the floor, all is painted a light green—even to the machinery. Down the centre of the machine room two white streaks, back of which trucks must be "parked," keep a wide trucking space always open.

Many manufacturers will wonder how they do it—make a clean profit and pay exceptionally high wages. They sure do it, and the answer is the old one of real efficiency and a disregard for old-fashioned orthodox procedure. Let us stop for a moment and consider a few figures. The company on its two manufacturing floors has 48,000 square feet of space, and at its present rate is turning out 45,000 pieces annually—almost one piece to a square foot of space. Not half bad! But this is the big item of interest—$2,600,000 worth of business in a year. With 180 names on the production pay roll, that averages $14,-444,44 turnover to the man! Seems to us that we once heard of a fellow who did $3,500 to a man, and he thought he was doing good!

Strict Attention to Finish

One word about the finish. This is the point where most persons—especially retailers—imagine the goods to be weak. We have seen the finish, and it's "up to snuff." Stain, filler, shellac, three coats of varnish—and efficiency. The secret—if there is one (and there isn't)—lies in the drying room. The stain, filler and shellac are handled in the orthodox way, and the varnish is sprayed on. Then the goods are placed in the hot drying room whose humidity is carefully controlled. In nine hours the trick is done and if they left the goods in for nine weeks, the results would not be any different. The finish is dry, and it is rubbed as all good stuff is rubbed. Rubbing machines are

used wherever possible and the last rubbing—oil and rotten stone—is done by hand.

One more bit of information which will interest the manufacturer is their sales policy. At the present date—like all the rest of the fraternity—they have orders on their books of five and six months' standing. They are filling these orders at prices quoted regardless of recent developments. When this business has been ceaned up, they will sell for 60 days, quote prices, promise deliveries at a certain date, and fill the orders within five days of the promise. When these goods have been disposed of, they will figure their allotment for the next sixty days, pro-rate it among their salesmen, and repeat the process.

Employers Co-operate with Technical School

The Boys, Who Work Under Signed Agreements, Spend Week in School and Week in Shop—Gratifying Results Achieved

By Jas. C. Clarke, in Manual Training Journal

It was my good fortune to plan and equip a practical shop for metal work at the Quincy School, Boston, where a special class of about thirty-five boys receive prevocational training, and a few were placed in shops, working in pairs on alternate weeks. It is a satisfaction that many of this class found their way into secondary schools and others became practical men at the trades. One of the latter is now making over thirty dollars a week.

When Hyde Park became a part of Boston, I was transferred to its high school to help in the development of the new co-operative industrial course.

In February, 1913, we visited local industries and placed twenty-two boys in eight different shops, for one afternoon a week, without pay. The experience these boys gained in drafting rooms. machine shops, sheet-metal departments, forge shops, foundries, and woodworking plants, gave them an insight into industrial life.

That fall (1913) the school program was so arranged for the industrial course that the school work came the first three days of the week, and real shopwork. with pay, the last three days. This arrangement was not entirely satisfactory either at school. because the boys came from different grades. or at the shops, which were short-handed the first three days. Too much cannot be said in appreciation of the public spirit shown by the superintendent of the American Tool and Machine Co., the general manager of the B. F. Sturtevant Co., the Becher Milling Machine Co. and others in tolerating these conditions and so freely opening their shops to the boys.

Increasing numbers in the fall of 1914 called for a week-at-school-and-a-week-in-shop program, with two alternating divisions taught by the same teachers. This was practically the same arrangement that prevailed at the Quincy School. One of the divisions was made up of third and fourth year pupils, and the other of second year boys. The course of study was prepared by George W. Earle, head master of the high school, in conference with the supervisory staff, and with an advisory committee of manufacturers and technical experts. Immediately after graduation from the high school work of this industrial course, the entire time of the student is given to completing the 7560 hours of shopwork which are required before the diploma can be received.

That the shop end of this work may run smoothly and not be crippled by the lapse of one of the pair of boys in any shop. we have prepared a one-year contract which must be signed by the applicant and his parent before any shop assignment can be made. This contract, while not legally binding, has kept most "on the job" for the school year.

This practical course is a boon to several groups of individuals: To parents of limited means who need the financial returns from the shopwork; to motor-minded boys who continue in school because of the relief shopwork gives on alternate weeks; also to boys who cannot afford a higher technical education, yet see a developing future through evening technical training after graduating from this co-operative industrial course. Several of our graduates are already in good jobs, and are carrying on advanced technical work. All of the class of 1916 have positions paying from $16 to $20 per week. Most of those who left school without graduating, are in the trades for which this course was fitting them.

Busy men have given freely of their time and experience to promoting the welfare of our prospective mechanics. Occasional lunches, prepared by the girls of the domestic science course, have brought the manufacturers and school superintendents closer together. Gatherings of fathers and foremen help to a better understanding. Parents and guardians have been conducted through the shops which were working evenings. That disappointment may not arise from any lack of knowledge of shop conditions, the head master calls the parents of the first year boys for a conference, and shop conditions are stated as plainly as possible, thus avoiding many lapses. At first several manufacturers were in doubt as to the practical value of our plan. Now, all our twelve shops heartily approve of this course, and are calling for more boys. Mr. Russell, of the Franklin Union, writes in regard to this high school course:

In conclusion, let it be understood that such a course, desirable as it may be, will not run itself. The nature of its work, with varying conditions, forbid a cut-and-dried program. It must be constantly changing, and unless there exists a hearty co-operation between the school men and shop manager, failure is sure to follow. The fact that these two distinct factors are working for the development of the boy makes the work of the co-ordinator most important. He must be a man used to both shop and school methods, able to plead the caues of our coming citizens in either plant, especially in the shops. Here they serve under different foremen and find varying scales of wages. It is to be expected that those in this course will not receive identical training in the trades. Piece work and modern productive methods limit a complete knowledge of the trades. but these shops also, can. and must be used by the coordinator, who finds value in these experiences if the jobs are changed with reasonable frequency. A few shops will take a boy to train him for a machine tender, claiming this to be a trade training. The cordinator must transfer worthy boys from such a plant and yet retain the good will of the management.

"Good Enough" Not Heard in This Plant

Modern Equipment and Methods Employed in Producing Pianos—Waste Material Utilized to Advantage—Spraying Machine and Humidity Controlled Kiln in Finishing Room

A stroll through the piano factory of Heintzman & Co., Limited, West Toronto, would lead one to believe that the motto of their whole organization is "Nothing is good enough. It must be perfect." Attention to detail, no matter how small, marks every operation in the production of their line of upright and grand pianos, and is possibly in no small degree responsible for the popularity of the Heintzman piano and the success achieved by "Ye Olde Firme."

American double cut-off in Heintzman plant.

This firm commenced the manufacture of pianos in 1851 and the first unit of the present plant was erected in 1889. Since then the business has grown and expanded until to-day it crowds to overflowing a large brick factory containing over 110,000 square feet of floor space. At the preesent time about 325 workmen are employed and the annual payroll is in the neighborhood of $350,000. Present production runs very close to 300 uprights and 15 grands per month.

Up-to-date Drying Methods Followed

The different kinds of lumber, such as chestnut, ash, spruce, whitewood, etc., are air-dried for from twelve to twenty-four months before being placed in the kiln. The kiln-drying is done in a four-compartment Grand Rapids kiln, and the most up-to-date procedure is followed. The stock is carefully tested before being placed in the kiln and the amount of steaming and the subsequent treatment is governed by the condition of the material as shown by this test. The lumber is dried to a moisture content of 4 per cent.

As a rule the lumber is allowed to cool and set before being removed from the kiln. When the weather is warm it may be moved before it cools thoroughly, but in any case it is run on a transfer car and placed in dry storage. From there it is taken to the machine department, as required. In the machine shop, after being cut to length, the lumber is ripped to the different widths required. This work is done on a Fay & Egan power feed band rip saw and an American endless bed straight edging and jointing saw. Both machines are giving entire satisfaction. The American straight edging and jointing saw is capable of extremely accurate work. Part of the material ripped is glued up direct from this machine without any further correction.

The stock for the cores, and any other material that requires gluing, is put through a Jackson-Cochrane glue jointer, which trues up the edge and from there is passes to the gluing department. After being glued up the pieces are allowed to stand for three weeks or longer before being machined and veneered. This gives the joint a chance to dry thoroughly before the stock is surfaced, and prevents the appearance of depressions so often found in veneered surfaces.

Glue Jointer Gives Good Service

Another interesting operation that is performed on the Jackson-Cochrane glue jointer is the trueing up of one edge of the back posts. This machine was not built for such heavy work but they have put a special head on and it handles the work nicely, turning out a straight, true job. The post material is about 3 x 4 and 4 ft. 6 in. long, and is dressed on two sides on the planer. Formerly one edge was squared up on the buzz but using the glue jointer for this operation as many pieces can be put through in one day as could be turned out in three or four days on the buzz.

The machine room is very completely equipped. Among the machines installed may be mentioned two Whitney planers with divided rolls, a Cowan chain mortiser, Preston two-spindle shaper, Fay & Egan band rip, American edging and joining saw, band saw, sticker, tennoner, three lathes, jig saw, Jackson-Cochrane glue jointer, swing cut-off, etc.

Preston veneer taping machine used in making pianos.

Utilizing Waste Material

One noticeable feature is the way the waste is worked up. In assembling the backs for the cases, a

lot of blocking is required for the top and bottom. This bocking goes between the posts and consists of pieces about 3½ in. thick x 6 in. to 8 in. wide, and 9 in. long. These pieces are all built up and the ends and edgings are worked into them. The width or thickness does not matter as every piece can be utilized provided it is sound. This is a good idea as it practically eliminates all waste.

When the core stock has equalized it is trued up, surfaced and run through a three-drum sander and is then taken to the veneer room. In addition the stock for the falls, trusses, arms, toeblocks, etc., has been machined and passed on for veneering. All veneer work is cross-banded with the exception of the falls, where instead of cross-banding a piece of cheese-cloth is placed between the face veneer and the core. With the exception of the large tops for the grand cases, the stock is cross-banded and the face veneers laid in one operation. In the case of the grand tops, the core is jointed up and allowed to equalize then dressed on a belt sander and the cross-banding laid. After the cross-banding has been glued on, the top stands for a month or more before the face veneers are applied.

Veneer Stock Properly Stored

The value of good veneers and cross-banding is appreciated and every precaution is taken to see that they are stored and handled in a proper manner. The veneer store-room is a large well-ventilated and adequately lighted basement. The veneers and cross-banding are kept in neat, orderly piles with lots of room around each pile. Every lot has a tag attached, giving the kind of stock, amount, name of manufacturer and date received. The basement is good and dry, with the result that the veneers are always in first-class shape.

As veneers are required, they are picked out, cut to size and re-dried. The face veneers are dried between hot cauls, while the cross-banding is stacked in racks and placed in a Greeffe dry-kiln. This is an automatically controlled heat and humidity kiln. A veneer jointer has been installed to take care of the jointing, and the taping is done on a Preston taping machine. The gluing equipment consists of a glue

DeVilbiss spraying machine on piano work.

spreader, glue mixer, hydraulic press and retaining clamps.

The veneered stock is left in the retaining clamps for twenty-four hours, then piled with sticks and placed in the Greeffe kiln. When the pieces are removed from the kiln, some are sized and the edges and ends veneered, while the remainder is trimmed up, but all veneer stock stands for at least thirty days before it is cleaned up and finished. This makes certain that the pieces are in perfect condition before being manufactured further. Each lot is numbered and

Heintzman Louis XV. Grand.

the date it was veneered is indicated on a ticket which follows the work through. Thus an accurate account is kept of the length of time the stock has been veneered.

Accurate Work in Cabinet Room

In the cabinet room where the various parts are sized and cleaned up, ready for assembling, the equipment consists of an American double cut-off saw with power adiustment, a Yates double spindle shaper, a Mattison hand-block belt sander, a Mattison oscillating belt sander, three other belt sanders, buzz planer, variety saw, and an American three-drum sander.

The work in this department is very particular, as the various parts are stained and varnished before the cases are assembled, so that the need of fitting must be entirely eliminated. Various forms of gauges and patterns are employed to secure this accuracy and the work tested from time to time to make sure that everything is going right. After going through this department, the gable ends are assembled and they with the other parts go to the finishing room for finishing.

Oak Fumed on Raw Wood

In the case of mahogany, the finish consists of one coat of light potash stain, a coat of shellac, then filler, stain and varnish. Five coats of varnish are applied, three with a DeVilbiss spraying machine and the two finishing coats flowed on by hand. The under-coats are dried in a Nichols automatic humidity-controlled drying-kiln, eight hours being all that is required. The final coat is allowed to stand for a month or more before being rubbed and polished.

The oak cases are fumed and waxed. The fuming is done on the raw wood, no wash or stain being employed. Naturally some stock takes better than other and the light pieces are given a coat of oil to darken

them. After fuming a coat of shellac is applied, then the light streaks and spots are touched up and another coat of shellac given before the wax is applied.

While the different parts of the case were being manufactured and finished, the backs were assembled in another department. The wrest-plank and pin-

A Heintzman upright in mahogany.

block were prepared and attached to the back, then the sounding-board was glued on. These boards are made of the very best grade of spruce and are crowned slightly so that they will retain their tension under strain. They are rigidly inspected and must be perfect to pass. The ribs and bridges are glued on before the sounding-board is attached to the back. The bridges, which are built up of selected maple, are glued in a special form and bored for the bridge pins before attached to the sounding-board.

The back is now ready for the iron frame. When this has been bolted on, the pin-holes are bored and the pins driven and the strings attached. It might be of interest to mention here that the strings are manufactured on the premises. After the strings are attached they are tensioned and chipped in or tuned.

The back is now ready for assembling and goes to the assembling room where the finished gable ends are glued on. The action is then installed and the instrument tuned. Then the key-board and keys are put in place and the "fly-finisher" attaches the top, doors, falls, etc., and then it is tuned a second time.

The next operation is regulating and adjusting the actions. After this is done a third tuning takes place. The piano now passes to the tone-regulating department where the tone is regulated and then goes to the polishing department for a final polishing and oiling. It is then given a final tuning and is ready for shipping.

Gluing up the Grand Rims

The making of the grand cases is a very interesting operation. The rims, which are built up on special forms, consist of an eight-ply core with face veneer on either side. The core stock consists of sawn, chestnut, ash, whitewood, etc., and must be in very long lenths, the larger grand cases requiring stock 22 ft. long. The whole rim is glued in one operation and after the work is once started, speed is the main requisite. The core is all glued and laid and then the face veneer put on and the whole rushed into the special form and pressure applied. When removed from the forms, the rims are allowed to stand for six months or more to thoroughly dry out and set. An inner rim, consisting of 13 plys, is glued up in the same manner.

The grand pianos are made in a separate department, most of the work being done by hand. The rims are cleaned up, scraped and sanded by hand and the inner rim attached. Then the key-board and braces are put in place. The mouldings and carvings are planted on and the bottom of the rim worked to the shape of the carvings attached. It is work calling for a high degree of skill on the part of the workmen.

The remaining operations are very similar to those followed in the making of the upright cases, and every precaution is taken to make sure that the grand is as perfect as it is possible to produce.

It will be noted in the foregoing brief description of the making of a Heintzman piano, that none of the operations are hurried. While the work goes through in a systematic manner, ample time is given for the glue moisture to dry out thoroughly after jointing and veneering. The same holds true in finishing. Each coat is given sufficient time to dry through and through before another one is applied.

This is only as it should be yet in many plants one often hears the expression "Oh that is good enough, let it go." "Good enough," dry enough," "Oh let it go" are not heard in the Heintzman plant. It is the strict attention to every last detail, coupled with skilled workmanship and the best materials that has placed the piano manufactured by this firm among the quality pianos produced in Canada.

A chiffonier from the Meaford line.

Not only your financial but your social habits as well have their influence on the willingness of your banker to extend accommodation when you want it.

Are You Keeping Detailed Costs?

By R. C. Little

International job recording clock

I happened to be looking at one of the I.B.M. clocks and, I thought of the likeness twixt the mechanism of the clock and the cost system of a plant, for a cost system is the special mechanism of the plant and like such must be thoughtfully planned, built well, if it is to be of service. It must be borne in mind that you can't buy a cost system, you must build your own. The fundamental principles in all systems are the same, labor, material, burden, and from this given the use of "up to the minute" labor, time and money saving devices, no great difficulty should appear in the way of building up a system for the plant.

The cost system should be installed slowly and with great care. By forcing the matter it will only lead to confusion and the so called system prove an expense. There is also a great danger of going to too much detail in commencing the system; it is better to have the details come along at a later date, otherwise one may smother the system with what may be called "red tape". The cost system must not only give the cost, but it must be used to reduce the cost. A chart may be drawn up showing the cost of the product month by month, from which the management can readily perceive the upward or downward trend of costs.

Outlining Cost Keeping System

Cost accounting is becoming more important each day and manufacturers are not viewing it as an expense but are looking on a good cost system as a good producer and a paying investment. Without touching the peculiar conditions which are found in each plant one may lay out a few ideas which may be helpful to the woodworker and furniture manufacturer. The plant will probably be divided into departments as follows: Dept. 1 Machine Dept. Dept. 2 Cabinet Shop. Dept. 3 Finishing Room.

A requisition is received at the Cost Department, for five hundred (500) cabinets. A production order is immediately made out with copies for every department the job will touch until it is completed. Dept. 1 commerce work on the job and every minute of time is charged on the time card to the number of the production order, no matter how many men work on the job all time must be charged to that number. Dept. 1 finish their work on it and the foreman sends in his copy of the production order to the cost department. This is costed and filed with the office copy and is held awaiting the return to the office of the other copies in the factory. The job going on to Dept. 2, here as in Dept. 1 all time on the job is charged to the production order covering the job. When the work is finished in this Department it goes on to Dept. 3 for varnishing etc. and when through here their copy is forwarded to the cost department.

An accurate and efficient method for keeping track of the time on different jobs or production orders in the different departments is to provide job recording clocks and have the workmen stamp the time started and time finished on suitable tickets. When this method is followed each machine is given a number and each individual operation, such as planing, ripping, shaping, etc., is known by number. The workmen mark the production order number, the machine and operation numbers and, if required, the catalogue number of the article, and stamp the ticket when starting that operation and again when they have finished. The accompanying cut shows a form of ticket used by many manufacturers. This is ruled so that the time for a number of jobs may be kept on one card. Another form favored by some manufacturers is provided with a space for the number of pieces finished by the workmen in the time stamped.

Advantages of This System

Keeping time in this way has many advantages over any other system. If an operation number is given to such forms of unproductive labor, as cleaning machines, repairing equipment, handling stock, sweeping floors, etc., not only can accurate account be kept of this labor but each department can be charged with its own unproductive labor. In addition it enables the management to analyze production

Time ticket used in many factories

costs. It will be noted if any operation is costing more than it should. The output of many machines is known and if these are not worked to capacity, the cause should be investigated and remedied.

Where the workmen give the number of pieces finished, a check is kept on the individual. If any men are soldiering on the job, the time ticket will show it. Not only that, but it is only natural that some workmen are more expert on certain forms of work than others. When this fact is established, as

it will when this system is employed, the mechanics may be kept at the work they are best adapted for. Many other advantages will occur to the reader. Some of the firms who have installed or are installing this method of keeping time, are the Canada Furniture Manufacturers Ltd., Woodstock, Ont., the Knechtel Furniture Co., Limited, Hanover, Ont., The McLagan Furniture Co., Ltd., Stratford, Ont., and the Jacques Furniture Co., Ltd., Kitchener, Ont.

Material Used is Shown

The material used in each department is shown on the department order. The orders are now costed showing the material used, and brought forward on the office copy. Care must be exercised not to close the order before all the labor has been posted. The burden or overhead is figured on the time card at the same time the labor is figured and posted with the labor. Many plants use a flat rate of burden, this is satisfactory, the only danger being that in a smaller plant when this method is used, if the rate of overhead is not large enough it might make an embarrassing condition at the end of the year when adjustments had to be made. A better plan would be to base the rate on the previous months burden charges, so that you carry your entire burden as you go. The burden rate may be charged monthly, and adjustment made each month.

Large plants and plants of a moderate size will find the Hollerith sorter and tabulator a great time and labor saver, in connection with their pay roll and cost records. The dial card is sorted into man number for pay roll records and production order number for cost records, the cards are then put through the tabulator which shows the hours worked by each man, the amount of wages earned and the total hours and dollars of the pay roll, likewise the cards in production order are put through the tabulator and a statement made showing order number, amount of labor on the order, burden and respective details. Good accounting equipment is necessary and instead of being an expense is a great investment. Clocks and cards suitably placed in departments save hours of waste energy. They are the means of the manufacturer dealing honestly with his employees and himself.

A great deal depends upon the choice of the cost accountant, he must be a fighter from first to last, bent on getting results and one who will run his department as efficiently and economically as any other.

Year 1920 as Viewed by the Trade

Manufacturers See Indications of Strong Demand Continuing—Labor Situation Not Satisfactory—Manufacturing Costs to be Higher—Strengthen Present Position and Prepare for Eventualities

A number of representative manufacturers of general woodwork, boxes and furniture were asked by the "Canadian Woodworker" for their views of the prospects in their line for the year 1920. The period upon which we have just entered may contain many surprises that will upset present calculations but the letters published below reflect the general thought of those engaged in the woodworking industry.

The demand in 1920 will be still greater than it was during 1919, but we are afraid that the production will not meet the demand on account of the scarcity of material, specially mirrors. Manufacturers of mirrors, in Canada, before the war were buying their supply of glass from Belgium, but for the past few years they have been getting their material from the U. S., where it has become scarce. If the Canadian glass manufacturers do not find any way of securing glass from some source other than the U. S., there will be certainly a great scarcity of mirrors and the furniture manufacturing will be handicapped.

Prices of mirrors have gone up lately and as a consequence prices of furniture have also advanced, and we anticipate that the present prices will not last long as mirrors will certainly go up again in the near future. Wages are also advancing on account of the high cost of living. The rate of exchange has a lot to do with the raise in prices, as the Canadian manufacturers have to get a good deal of their supplies from the States, it raises the cost of manufacturing.

The St. Lawrence Furniture Co.,
Riviere Du Loup, P. Q.

* * *

The outlook for 1920 for the Box and Lumber business, as we view it, is that the demand in both lines will be brisk —greater even than 1919.

The writer has just returned from Boston and New York where he went carefully over the situation as a whole and asked many opinions of those posted in the trade and it seemed to be generally conceded that building on a large scale for 1920 had simply become imperative and that people would be compelled to build irrespective of the cost of lumber. Manufacturing costs for the coming year will depend more or less on how the cost of living barometer moves, but we are inclined to think that it will on the whole cost more to manufacture during 1920 than it did in 1919, consequently the prices of lumber will continue in the upper register—indeed the cost of logging for the present winter is much higher than the cost for the preceding season.

Labor we think is likely to remain more stationary than it has for the past two or three years but the tendency will be higher and not lower until such time as production reaches a point somewhat commensurate with the world demand for the necessaries of life. There seems to be a feeling among the better class of labor that they are tired and sick of strikes and that they would now like to settle down to a permanent settled condition and a hope that gradually the cost of living will begin to sag, although apparently no one expects to see prices go back to anything like pre-war figures.

Wilson Box Company Limited,
St. John, N. B.

* * *

On account of continued low production, owing to strikes, which existed in 1919, and the great difficulties of getting materials, we figure that with a continued heavy demand, which should exist for furniture during 1920, the furniture manufacturers shall have more business on their books than what they will be able to deliver. One main reason is the housing schemes which will build in Canada during 1920, probably 5,000 to 6,000 houses. If only $1,000 were allowed to furnish each house, one can imagine the

tremendous amount of furniture this will represent to our Canadian Furniture industry. However, with all these nice prospects, the furniture industry of this country is in a very trying situation and never before has the furniture industry faced such a situation as exists in lumber and mirrors. Factories are exhausting their stocks of lumber which are difficult, if not impossible, to replace while the cost of labor is constantly increasing. We understand that the output of the United States chair manufacturers is now about 25 per cent. below normal, whereas the volume of orders on hand is about 300 per cent. greater than normal. Practically the same applies to Canadian furniture manufacturers. Under such circumstances, manufacturers should be very careful not to book orders too far ahead, nor to accept a greater volume of business than they can turn out within the specified time; also they should watch their costs and take into consideration what it is going to cost them to replace the materials they are not using up.

Victoriaville Furniture Company Limited,
Victoriaville, P. Q.

* * *

Owing to the present uncertainty in the lumber market, it is indeed a problem to try and anticipate the demand for sash and doors for 1920.

If lumber prices remain firm, there should be a big demand for our line of goods, and the business of 1920 should exceed the business of 1919 considerably. However, should lumber prices continue to soar, it may put a check on building operations. In so far as we can judge, there is, apparently, but a limited quantity of well-seasoned lumber on the market at present.

At the present time labor is restless and in all probability wages will be somewhat higher. In our opinion, labor will remain an uncertain quantity until such time as the question of "high cost of living" has been solved.

The only action the manufacturers can take to help better conditions would be to secure the co-operation of the builders with a view of standardizing both sash and doors as far as possible, and thereby reducing the cost of production.

R. Truax & Son,
Walkerton, Ont.

* * *

As far as we can judge at the present time there is going to be a very active demand for at least the first six months of this year, and providing labor does not give too much trouble the furniture industry of Canada should enjoy a good season's business.

What the last six months of the year will bring forth we are unable to estimate at the present.

The McLagan Furniture Company Limited,
Stratford, Ont.

* * *

We do not look for business outside of the Island of Cape Breton but do receive some orders from other parts of N. S. and also from Newfoundland, so our ideas of business for this year will be based on conditions in Cape Breton generally.

We anticipate good business, there appears to be much business ahead of us and as there is not a vacant house or room in the city, many houses must be built to accommodate the additional employees that must be secured to start and operate the new ship plate mills that are now nearing completion. Large works projected here are the building of Ocean Terminals and an $800,000 hotel, both of which are now assured.

The farmers have had a good year and the fishermen, who bring much wealth from the seas every season, have had a successful year, not only in the quantity of the catch but the prices have been good, and as our trade extends all over the Island and all ports are reached by Sydney owned and operated steamers we have every reason to expect a good business from the country and seaports all over the Island.

There are big developments ahead of us in coal mining. The Dominion Coal Co., who are good customers of ours and who are constantly trusting more of their ever increasing business to us, will open new mines and all indications are that this business will be good and reasonably steady for years to come. We expect a greater demand than in 1919.

We do not anticipate any reduction in manufacturing costs and slight increases will likely follow. Local lumber which is not of a high grade will likely be lower because of the fact that many new concerns are going to operate in a very small way and will produce an inferior grade both in quality and manufacture. Our opinion is that N. S. and N. B. lumber generally will be higher and that pine will take a big advance. Labor will remain much the same as at present with some special advances to good men.

The manufacturers of lumber can better their conditions by realizing the value of every piece of lumber and caring for it as they do for the dollar in their pocket, stick it properly from the saw, roof all piles, season it properly and have it in proper shipping condition as soon as possible after it is cut. Proper care for lumber from the saw will enable the consumer to use grades lower than would have to be used if proper care was not taken and a little extra costs in piling and properly caring for will be profitable, not only to the manufacturer but to the dealer and consumer as well.

Chappell Bros. & Co., Limited,
Sydney, N. S.

* * *

We think that the demand for furniture during 1920 will be equally as great if not greater than during the year 1919. Manufacturing costs will be higher, owing to higher wages being paid; raw material is on the upward trend, lumber is very scarce and going higher all the time. There appears to be plenty of poor labor, but skilled mechanics are very hard to get.

Beach Furniture, Ltd.,
Cornwall, Ont.

* * *

Under present manufacturing conditions, it is extremely difficult if not impossible, to tell how business will be in Canada in a few months' time, but we are under the impression that there will be an active market for all lines of furniture for some time to come. There is no question but that it would be a good policy to extend the Export trade, but unless a concern has a large plant, it is practically impossible to get after this business under present conditions. If it could be done, no doubt a good business could be worked up which would assist greatly when the quiet times come in our home market. The larger manufacturers may be able to do something, but we are of the opinion that the smaller concerns will not be able to take advantage of this opportunity.

Windsor Furniture Co., Limited,
Windsor, N. S.

* * *

So far as our particular business is concerned the prospects for 1920 appear to be exceptionally bright. In view of existing market conditions our opinion is that manufacturing costs must undoubtedly increase. Lumber and labor which represent the heaviest items in the cost of production in our business are gradually going higher. We do not expect the price of lumber will drop for possibly a year at the earliest and if the building boom continues as at present

there is every reason to believe that lumber prices will go very considerably higher.

It is quite evident that if the eight-hour day is inaugurated as seems to be apparent at this time, manufacturing costs must necessarily show a very considerable increase. To offset this, to a certain extent, it is possible to install labor saving machines which will increase production. The principle of the eight-hour day is very nice indeed but in a country the size of Canada that has such glorious chances to expand and whose territory is not crowded with a dense population it seems to us that it is a rather fatal step to take. In Great Britain for instance, particularly in England where the population is dense, in order to keep everybody employed we can readily see how the eight-hour doy would perhaps be an advantage, but we cannot help but recognize the fact that the cost of production must necessarily increase and our frank opinion is that the only way in which we can overtake the high cost of living is to take off our coats and roll up our sleeves and really get to work. The four years of war through which the world has passed has upset the equilibrium of every nation and as intimated before we think the quickest way to forget their troubles is to get busy and work and then one will see the cost of living come down and not before.

Houvd & Company Limited,
London, Ont.

* * *

At the present time we are shipping to New York and Mexico. Previously we could not quote against the American mills but prices are so high in the states that we are able to secure business in their field. Rather than enlarge our plant (perhaps it would be wise to do so) we intend to operate two shifts to cope with the present abnormal demand.

We will take export business this year in preference to domestic. That will help our own country and what helps Canada benefits us.

It is difficult to see how labor can be any cheaper for wages cannot go down and prices up. Prices, everywhere, are too high. There must be a break as present rates bear too heavily. I do not, however, look for any decline this year.

Our aim will be to extend production to the limit with present equipment and endeavor to strengthen our financial position so as to be prepared for all eventualities.

Pacific Box Co., Limited,
Vancouver, B. C.

* * *

We will try to outline things as we see them for 1920. We believe there will be a good demand for all wood products in the building line. When we say this, it may not be true generally, but it will be true for Kitchener and the surrounding district. We feel that costs will be considerably higher, labor as well as raw material. There seems to be a scarcity all over North America of lumber for house building purposes, and the cut to be taken out this coming winter will no doubt be used up as fast as the logs are made into lumber. We cannot see that the manufacturers can do anything to reduce the costs of lumber, as labor is steadily climbing, and by increasing the cut to create a surplus we feel will not help matters any since there appears to be a good export trade in lumber at the present time.

Jacob Kaufman Limited,
Kitchener, Ont.

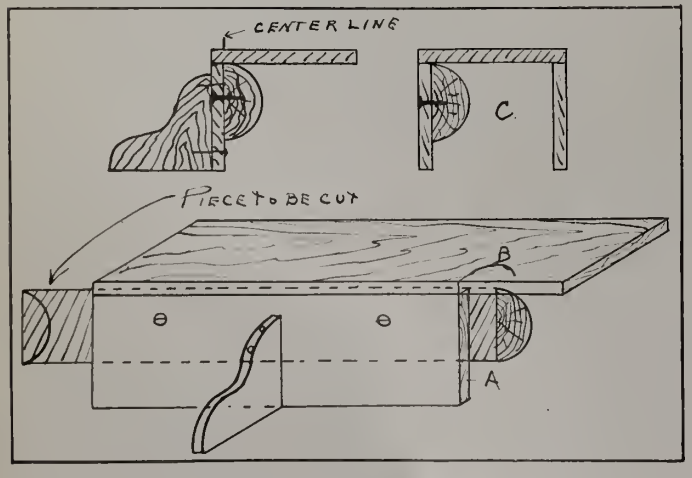
An Idea for Pattern Makers

H. S. Longworth

If two men each have a dollar and exchange them neither one is any better off but if two men have an idea and exchange each man has two. Ideas can be exchanged and retained at the same time.

The accompanying illustration shows a jig or form that we find very useful. It is for cutting branches for pipe or other patterns on the band saw. If the cut is made carefully the branch can be attached as it comes from the saw thus avoiding the time-consuming cutting and fitting necessary when the work is done by hand.

In making the form the end A should be trued up on the sand wheel. The branch, which is made in halves marked off on the joint and screwed into position with the line on the trued edge A. The radius of the body of the pattern, when the branch fits, is marked on the top of the form, the centre of the compass being in line with the joint of the piece to be cut. After the branch is attached cut along this line, B, with the band saw far enough to have cut the branch then back the saw out and leave the top piece intact. It can then be used as a guide for similar cuts.



Form for cutting branches.

Branches may be cut at any angle by simply screwing the piece in the required position. Mark the angle off on the form and screw the piece in place and proceed as before.

The sketch C shows another adaptation of the same idea. It is merely an inverted mitre box. If this form is used the bracket is not required.

Any number of pieces may be cut on the one jig. When once used this idea will be found very handy taking as it does half the work and worry out of any job where it can be applied.

(We would appreciate some practical idea that you employ. Send one in.—The Editor.)

New National Hardwood Inspectors

Arthur G. Bowler has been appointed Deputy National Inspector, and placed in charge of the Montreal district. His present address is 179 Drummond St., Montreal, Que. John E. Banks has been appointed Deputy National Inspector to assist H. L. Hebard in charge of the Toronto district. Applications for inspection work in the Toronto district should be addressed as heretofore to H. L. Hebard, 383 Carlaw Ave., Toronto, Ont.

Strengthening Boxes with Metal Straps

Most Efficient Method of Increasing Strength—Various Forms of Material Employed—Location of Band Important—Stock Must be Dry

There is no other means which will strengthen a box so greatly as reinforcing it with steel strapping. Tests show that it is possible to increase the strength of a box 100 per cent. or even more by the proper application of steel strapping. Also thinner lumber can be used and the cost of the box reduced and in addition strapping is of great assistance in preventing pilfering of boxes.

It is good export practice to strap all boxes for overseas shipment no matter what their size, weight

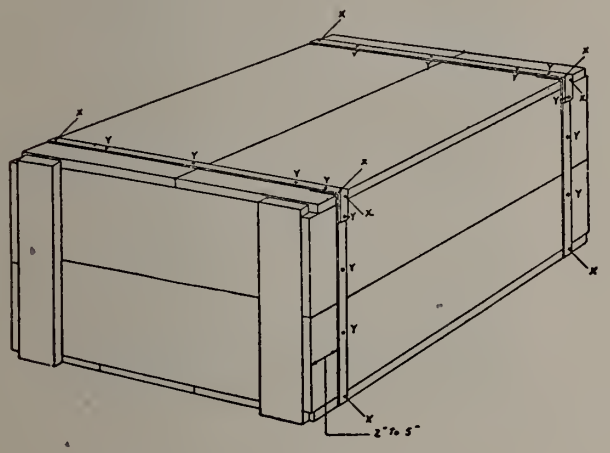


Fig. 1—Placing strapping in from end.

or destination. If strapping were also used to a much greater extent on domestic shipments it would go a long way toward reducing the damage claims paid by the carriers for broken and pilfered boxes. Also the required strength of a container can be secured much cheaper by the proper use of steel strapping than by lumber of excessive thickness.

Various Types of Strapping

The most common types of strapping are flat steel band strapping and single or twisted wire strapping. There are also efficient special patented types of nailless strap and wire. For all-round use, however, there is no better strap than the flat band, cold rolled, unannealed steel strap, coated to prevent rust, if it is properly stretched, properly located on the box and properly nailed.

Unanealed flat band strapping makes a stronger binding than annealed, for the unanealed strap possesses by actual test over 30 per cent. more tensile strength than the annealed. Also it usually does not cost any more. The tensile strength of a strap is its most important quality, as most strap fails by a direct tensile strain or by a tear. When a box dries out it shrinks and the strap loosens between nails, causing it to bulge away from the box. Then, when the box is handled in freight cars, on docks, in the hold of a ship or in the warehouse the strap often catches on nails or other projections and tears or breaks.

Annealed strap because of its low tensile strength is consequently much more liable to tear or break than unannealed strap. Also the annealed strap possesses considerable ability to stretch which is another undesirable quality. The annealed strap nails somewhat easier than the unannealed but in the gauges used for ordinary boxes there is no difficulty in nailing the unannealed strap.

Width and Thickness Employed

The width and thickness of strapping which should be used depends upon the size and gross weight of the box. On boxes up to 100 lbs. gross weight, where the size is not excessive, strapping ½ in. wide by .018 in. thickness should be entirely satisfactory.

On boxes over 100 lbs. gross weight, or on boxes of large size, a stronger strap should be used, ⅝ in. by .020 in. or ¾ in. by .015 in., having a tensile strength of around 1200 lbs. The larger, heavier cases require a stronger strap as the heavier weight of the contents is more liable to spring the side, top and bottom of the boards and cause the nails in the end of the box to start.

Boxes are strapped in two different ways: with the strap directly over the ends of the box and with the strap a slight distance in from the ends as shown in Diagram 1.

The location of the strap slightly in from the ends of the box gives a tighter binding, especially on boxes which are long, than strap applied directly over the ends, because, in this position it better prevents the bulging of the side, top and bottom boards which causes the nails in the ends to start. However, on boxes whose sides, top and bottom are less than ⅝ in. in thickness, it is somewhat difficult to nail the strap, when applied in from the ends, because of the thinness of the boards. The distance which the strap should be in from the ends will vary with the size of the box and the weight of the contents, but will generally be somewhere between 2 in. and 5 in.

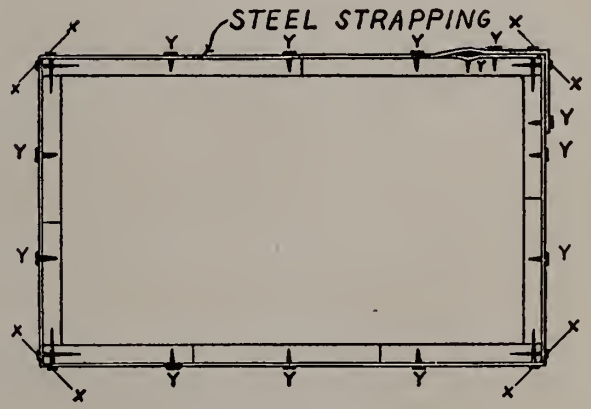

Fig. 2—How nails are spaced when strap is in from end.

Nailless strap and wire are always applied in from the ends of the box, being drawn tight by a stretching tool and the ends either sealed with a seal for flat band strap, or twisted if wire strap is used.

Strap applied directly over the ends of the box is generally easier to apply than strap applied in from the ends, because the ends of the box afford a firmer nailing surface and not so much care has to be exercised in nailing. Strap located on the end of the box not only assists in binding the sides, top and

bottom boards to the end, but also serves to prevent the nails in the side, top and bottom boards from working out.

Stretching and Nailing Bands

The stretching of the strap is of the utmost importance, for a loose strap loses most of its efficiency as a binding, and the tighter the strap, the less it will bulge when the box shrinks. There are a number of tools on the market which stretch the strap well and are simple to use.

Diagrams 1 and 2 show the correct way to nail strapping when located in from the ends of the box with double corner nails "x" and small flathead nails "y" holding the strap to the side, top and bottom of the box, spaced about 6 in. apart. With ½ in. strap it would probably be difficult to place two nails at the corners as shown at "x" in which case one nail should be used driven through the strap and through the top or bottom board into the side board. The lap of the strap should be at the corner as shown, a nail being driven close to the end of the strap so as to hold the end down firmly.

The double corner nails "x" hold the strap securely against a pull in either direction and the intermediate nails "y" keep the strap snug against the box and prevent it from bulging. Fourpenny cement coated nails are generally large enough for the corner nails "x" and the intermediate nails "y" should be short. flatheaded nails of length slightly less than the thickness of the sides, top and bottom. All nails should be cement coated.

Strapping located directly over the ends is nailed with double corner nails "x". The intermediate nails "y", however, are the same size and length as the nails "x" and are generally spaced about 3 or 4 inches apart.—"How to Build a Box."

Australia Objects to Wormy Boxes

A recent consular report from Melbourne, Australia, has the following, which is of interest to box manufacturers:

"The Federal Director of Quarantine at Melbourne has brought to the attention the fact that officers dealing with food substances and general cargo imported into Australia find that the packing cases are not infrequently constructed of wood that shows the borings and workings of insect timber borers. In order that destructive boring insects should not in this manner be introduced into Australia, the Federal Director of Quarantine has requested that the matter be brought to the attention of the government and the shippers. It is important that some action should be taken to prevent the packing and shipping of goods intended for Australia in wooden cases presenting evidence that woodboring insects are or have been present."

Comments by Bureau of Entomology

The foregoing item having been called to the attention of A. D. Hopkins, of the Bureau of Entomology, Washington, D.C., he commented as follows: "It would be an unheard of thing for insects that cause holes in pine and other soft woods remaining in the wood long enough to reach Australia; in fact, no insects are at all likely to remain alive in the lumber after it is seasoned or made into boxes. The sapwood of seasoned hardwood lumber, if infested with powder post (Lyctus) beetles, could be carried into any country, but packing boxes are rarely made from hardwood on account of the heavy weight as compared with soft woods. It would, in my opinion, be an injustice to shippers to require boxes free from worm holes. It would add greatly to the cost of the boxes and little or nothing would be gained as a prevention of the introduction of harmful insects."

When Your Saw Teeth Crumble

Once in a while a saw filer will be confronted by crumbling saw teeth. Seemingly, in spite of all that he can do he will find, when the blade is removed from the machine, that the points of a considerable number of teeth have crumbled and broken off.

An old saw filer, when asked how he treated teeth that showed a tendnecy to crumble, replied:

"Whenever I found the saw teeth crumbled when I swaged them, I took an 8-inch file and side-filed them to the gauge that my shaper shaped them to; in this manner the steel of the saw tooth was worked one way and a few repetitions of this method prevented any further crumbling and a smooth cut was assured.

"In going into further details as to why I did this I will give my version of the crumbling. When the teeth are swaged, the crumbling seems to radiate from the root of the swage. Now, when you work it through the shaper the steel is worked back to place. This continual spreading and compressing destroys the cohesive quality of the steel. When applying the above method, I have found that the first time this crumbling disappears and the teeth hold their cutting edge. Always, upon taking the saw off, I note the condition of the teeth that were crumbled and if necessary apply the above method when I have to swage. If the crumbling appears again, I repeat the process.

"In addition, I might add that it is sometimes necessary to face the teeth up with a file as the grinder sometimes fails to face them up well. In my years of experience the above method has proved itself and the teeth have held up."

Maple Flooring Required in Britain

A report recently received from London, Eng., states that the general outlook for maple flooring at the present time is excellent, as there is a good demand, and with the large amount of building in prospect, this should steadily increase, as industrial conditions become more settled. The sizes most in demand are 1-inch and 1½-inch by 4-inch. Wholesale prices at various dates during the past few years have been as follows:—

December 31, 1915,	£22	to	£27		per standard.
December 31, 1916,	27	to	32		"
December 31, 1917,	30	to	40		"
June 1, 1918,	35	to	45		"
December 31, 1918,	35	to	45		"
February 1, 1919,	30	to	37	10s.	"
May 1, 1919,	25	to	35,		"
September 1, 1919,	55	to	65		"
August 1, 1919,	55	to	65		"

"I am not much of a mathematician," said carelessness, "but I can add to your troubles, I can subtract from your earnings, I can multiply your aches and pains, I can divide your attention, I can take interest from your work and can discount your chances of safety.

New B.C. Lumber Commissioner

Wm. Robertson, of Victoria, who recently succeeded Major James Breckin, as British Columbia Lumber Commissioner in the East, with headquarters at Toronto, has been successful in securing bigger and more convenient quarters. Starting next month, the offices and display rooms of the B. C. Lumber

Wm. Robertson, Victoria, B.C.

Commissioner will be on the ground floor at 1 Adelaide St. East, where larger space and show-window facilities are available. Mr. Robertson has several other plans in view of an educational and propaganda character, so far as making more widely known the merit, worth and adaptability of B. C. forest products are concerned.

The new Commissioner followed the lumber business for a great many years, spending part of this time in B. C. In 1914 he enlisted and was sent overseas. During service in France he was injured and ultimately received his discharge. He returned to Victoria, B.C., and entered the service of the Forests Branch of the Department of Lands. On the resignation of Major Breckin as B. C. Lumber Commissioner for the East, Mr. Robertson was given the appointment and has taken up his new work with enthusiasm.

Furniture Exhibitions in Various Centres

The annual furniture exhibitions are being held from Jan. 12 to 24 at the different furniture centres. The usual exhibits are being made at Kitchener and Stratford. The F. E. Coombes Furniture Co., Limited, and the Andrew Malcolm Furniture Co., Limited, are exhibiting in their show rooms at Kincardine, instead of in Toronto, as on former occasions.

The Toronto exhibitions include the Owen Sound firms, the C. F. M. line. The Ideal Bedding Co., the Gendron Mfg. Co., the Canadian Meseneau Co., and the Gold Medal Furniture Co. are all showing at their Toronto plants.

Priestman Plan of Fixing Wages

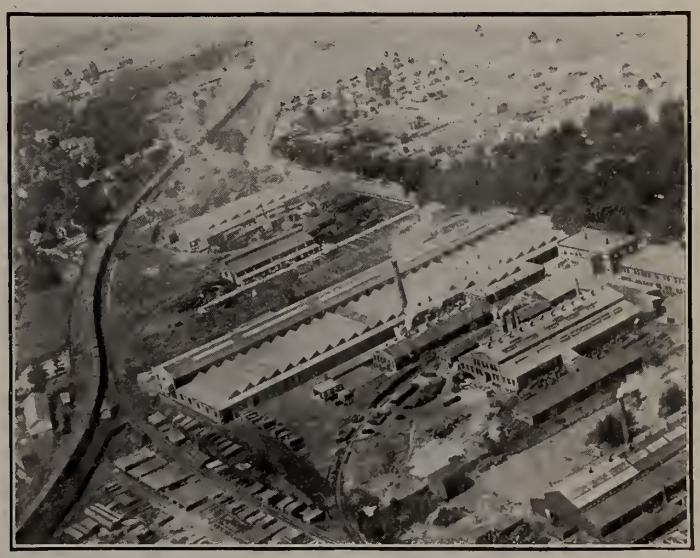
Details of a scheme adopted by a firm of machinery manufacturers which has increased its average output by 50 per cent. was recently made public. The Priestman scheme, as it is called, is based on the principle that a number of men can produce by ordinary effort a certain amount, known as the "standard," but by increased individual effort this can be exceeded. Every employee receives a percentage on his wages for all output in excess of the "standard." Thus, if the outpput is increased by 50 per cent. a workman earning $20.00 a week would receive $30.00. The friction often caused by piecework is thus avoided, and a maimum output is advantageous to all concerned. It is claimed by the council that the scheme is the "solvent of many, if not all, of the difficulties now facing industry."

Hibner Interests Disposed of

A new firm, known as Malcolm & Hill, Limited, has purchased the Kitchener and Listowel plants of D. Hibner Furniture Co., Limited. It is the intention of the new company to turn out a highly specialized line of bedroom furniture. Those behind the deal are James Malcolm, of the Andrew Malcolm Furniture Co., Limited, Kincardine, and E. A. Hill and S. J. Rutherford of the Toronto Plate Glass Co., and B. B. Hunter, an insurance broker of Toronto. Possession is expected about March 1.

Unique View of Rochester Plant

The interesting illustration accompanying this item shows a bird's-eye view of the main plant of the American Woodworking Machinery Co., Rochester, N.Y. This is where the well-known line of "American" woodworking machines are manufactured. The picture gives a good idea of the size of the plant and shows the adequate trackage facilities enjoyed by this



Aerial view of American Woodworking Machinery Company's plant.

company. The saw-tooth roof construction, noted on several buildings, is the most modern idea in factory construction, giving a maximum of light and ventilation. As far as is known this is one of the first U. S. industrial plants to be photographed from the air. The Garlock-Walker Machinery Co., Limited, Toronto, handle the "American" line of woodworking machines in Canada.

Machinery & Equipment

New Hoop Forming Machine

At present practically all flat hoops made in Canada are made from elm, it being one of the few woods for coiling that can be successfully handled. This has to be steamed and when coopers use the hoop they frequently have to soak them so they can handle them without breaking. With the new Richardson hoop forming machine hoops can be made from any wood and coiled without the use of either steam or water. Simply cut the stock to size, paint, lap and run through the machine. Will bend 12 in. and larger.

The hoop is formed by being carried on a travelling steel band around a power-driven corrugated bending wheel. The hoop enters the corrugations by means of an adjustable pressure roller in addition to the steel band. This corrugated wheel leaves indentations on the inner side of the hoop as it is bent, making the hoops very pliable. The teeth of the bending or corrugated wheel are nicely rounded so as not to cut the stock. The required pressure for proper depth of indentations for circle desired can be easily regulated by screw for adjusting the pressure roll.

The steel band is 1½ in. wide to fit exactly between the flanges on the corrugated bending wheel. There is a guide to guide the stock while entering and a deflecto rset so as to protect the operator and to turn the hoop out after passing around the bending wheel.

The bending wheel is regularly 12 in. diameter, 1½ in. face, bevelled 3/16 in. Other sizes and different bevel can be supplied to order. It has heavy deep flanges to guide the stock and hold it in place when being formed.

The tension pulley at opposite end from bending wheel is provided with screw and hand wheel for take up to suit length of band and has a veavy coil steel spring to tension.

Bending wheel will do fine work running 20 to 25 r.p.m. which will give an output of from 6,000 to 7,000 hoops per nine hour day. With good materiai, the speed may be increased to bend from 10,000 to 12,000 per day and can be fed by one man.

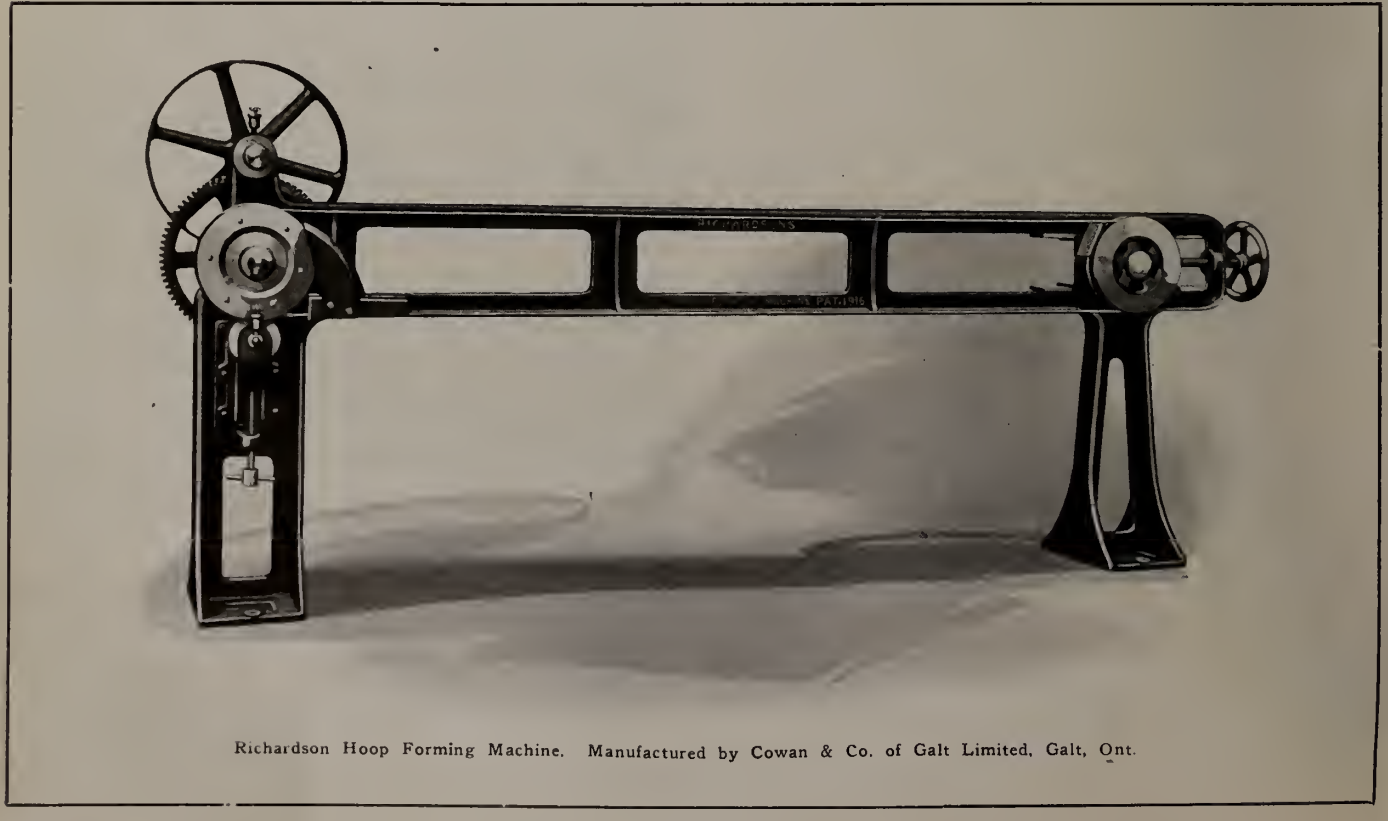
Steel band 23 ft. 6 in. by 1½ in. Drive pulley 24 in. by 6 in. should make 86 r.p.m. to give bending wheel 20 r.p.m. Floor space 14 ft. x 2 ft.

Full particulars may be secured from Cowan & Co., of Galt, Limited, Galt, Ont.

Root Multiple Spindle Boring Machine

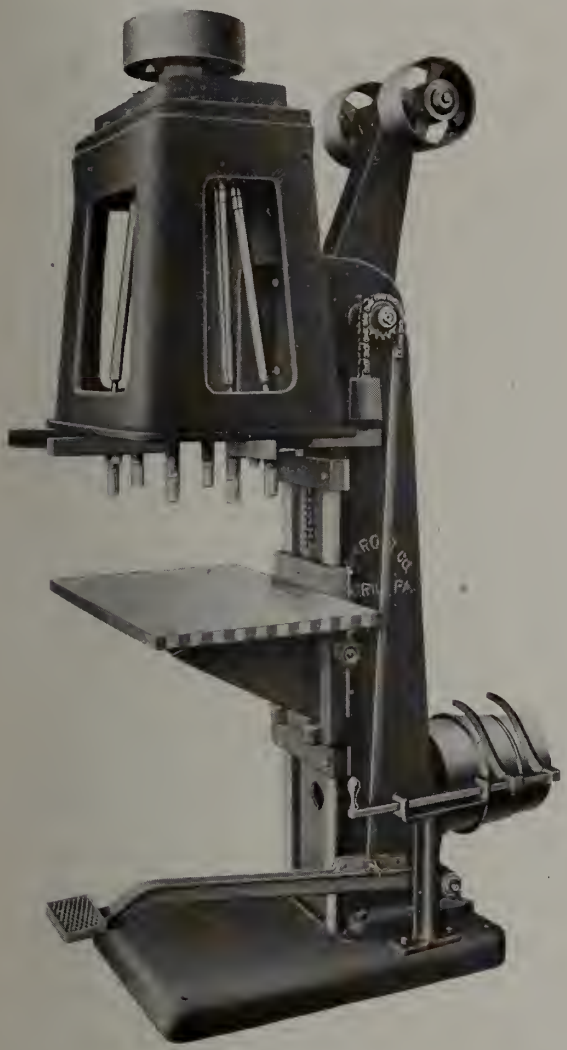
Multiple boring is a matter of growing importance to woodworkers generally. Manufacturers of talking machine cabinets, auto bodies, agricultural implements, and other articles find multiple boring a necessity in order to produce at low cost and to increase production.

The accompanying illustration shows a multiple spindle boring machine manufactured by the B. M. Root Co., York, Pa. The boring area is 14 in. x 25 and the six spindles collectively bore all over this area. Each spindle can be set to work at any point



Richardson Hoop Forming Machine. Manufactured by Cowan & Co. of Galt Limited, Galt, Ont.

within its range of action, which is about 6 in. from its straight position. The table which is 12 in. x 32 in. is adjustable for long or short bits for thin or deep work. It is raised by treadle giving easy boring strokes. Special boring rails and boring heads for staggered or straight rows of holes or for groups of



Root Multiple Spindle Borer.

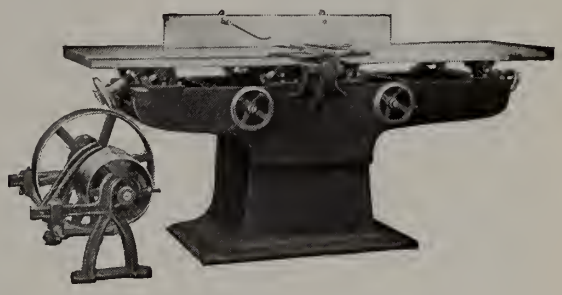
holes close together may be secured. May be had with either countershaft or motor drive.

With this machine the laying out of holes is eliminated and a number of holes are bored at one operation. It is well adapted for boring motor boards for phonographs, box parts, furniture parts, etc. Full particulars may be secured from the makers.

Jointer Embodying New Features

Some new features are embodied in the No. 800 jointer manufactured by the Silver Manufacturing Co., Salem, Ohio. This machine, which is made in four sizes, 8 in., 12 in., 16 in. and 20 in., is fitted with an efficient safety guard. The usual slide or groove is replaced with hardened steel pins, on which the tables are mounted. Split bearings are employed and all play may thus be taken up, keeping the tables firm and rigid at all times. The tables can be moved back and forth by means of hand wheel provided on working side of machine. This gives ready access to the head for sharpening knives or fitting special cutters. The vertical movement of tables is also controlled by handwheels and an auxiliary wheel lock the tables firmly in position.

A square slotted head is provided, but a round head may be had if desired. The square head is milled for the attachment of special cutters.



A Silver Jointer, table mounted on steel pins.

Full particulars may be secured from the manufacturers.

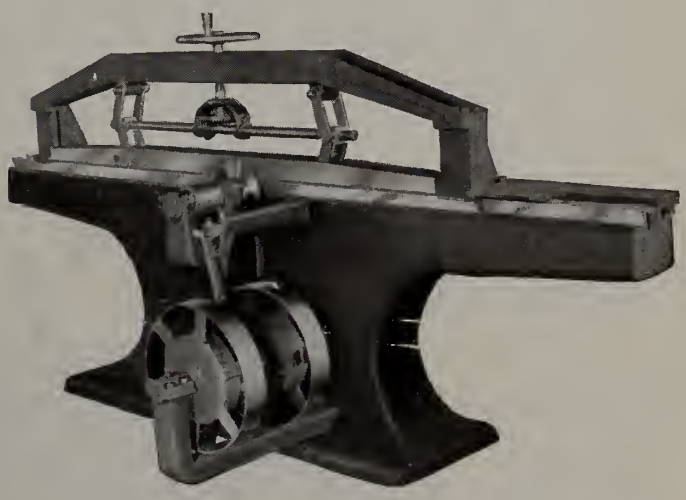
The Jenkins-Falls Veneer Jointer

The Jenkins-Falls No. 23 Veneer Jointer is manufactured by the Jenkins Machine Co. of Sheboygan, Wis., and sold in Canada by the Garlock-Walker Machinery Co. Limited, 32 Front Street West, Toronto.

It has been enjoying considerable popularity in Canada during the last few months. Some recent purchasers are:

Geo. McLagan Furniture Co. Ltd., Stratford.
Knechtel Furniture Co. Ltd., Hanover.
Canada Furniture Mfrs. Ltd., Woodstock.
Anthes Furniture Co. Ltd., Kitchener.
Preston Furniture Co., Preston.
Panels Limited, Southampton.
St. Thomas Cabinets Ltd., St. Thomas.
Williams Piano Co., Ltd., Oshawa.

In addition, the Office Specialty Mfg. Co. of Newmarket, and the North American Furniture Co. of



The Jenkins-Falls Veneer Jointing Machine.

Owen Sound, have been using these machines with success for years.

One feature of the machine that makes it so popular is that the veneer is clamped in place by a special clamping device, and is held flat while the travelling carriage carries the veneer past the cutter. Thus, buckled and crooked veneer can be jointed perfectly straight. The machine will joint either with the grain of the wood or across the grain for butt joints.

Upholstering and Trimming

A Plea for Better Upholstering

By W. L. D.

Upholstered furniture is a line that is purchased largely on faith. When a person buys a buffet or table they are in a position to form a fair idea of the worth of the article and to judge the soundness of the wood and the strength of construction. In upholstered goods this opportunity is, to a certain extent, denied them, which is especially true of stuff over pieces.

The manufacturers of upholstered lines, some at least, might well take a greater pride in their output and insist that none but the best grade of material be employed. Let them turn out a product that is worthy of their name and put their name on it and let the name sell the line. The phrase "good enough, let it go," should not be heard in any factory, and especially not in an upholstering shop.

Room for Improvement

That there is room for an improvement in many upholstered lines will readily be admitted by any observant person. How often has one gone into a room and sat in a covered chair only to feel that they were going through to the floor. This occurs on some expensive pieces as well as on the cheaper grades. Then look at the appearance of some pieces that have been in use for a few months or a year. Note the flat, beaten-down appearance of the seat and arms, see the loose wrinkles in the covering, due to the sagging of the filling and foundation. Should these symptoms appear in good upholstered furniture, where a fair grade of material was used and all the work conscientiously done? The writer thinks not.

Strength of Frame Important

There are those who think that because the frame of a stuff-over piece is covered and hidden from view that any kind of material can be put into it. Lumber that cannot be used up in any other way is utilized in making frames for the upholstered line. This is a fatal error. While the appearance of the wood is non-essential, it should be as strong as that entering into any other pieces of furniture. The frame is the foundation of the whole piece and unless well constructed of good sound wood the life of the piece is shortened. It matters little the quality of the material used in covering, if the frame is weak the finished product will be unsatisfactory.

The same applies to the webbing employed. The strength of the web is an important item. Compare the webbing used in England with that used in Canada. Is it any wonder that the furniture upholstered in England holds up and is handed down from one generation to another. It is a matter of pride with Old Country upholsterers to turn out an article that will give lasting satisfaction and comfort.

No Details Should be Overlooked

While the frame and webbing are very important items, as they are the very foundations of the work, the balance of the construction should not be overlooked. The cotton and canvas used should be strong and capable of standing up under severe service. The springs should be long and yielding and a sufficient number should be put in to ensure a lasting job.

Price Not All Important Factor

Many will say that if the best material were employed and every attention given to details that they would have to increase present prices. Admit that that would be necessary. Price is not as big an item to-day as it was a few years ago. Isn't it better to make a good article at a fair price than turn out a poor product at any price. The lasting satisfaction derived from a high-grade piece of upholstered furniture remains long after the price itself is forgotten.

The trend of furniture production seems to point toward quality as the goal. Let all upholsterers keep abreast of the times and turn out none but quality furniture. It may be a bread-and-butter line that is being produced, but good materials and good workmanship can be used and the price fixed accordingly. Let the furniture be built up to a standard, not down to a price.

Chesterfield couch manufactured by the De Luxe Upholstering Co., Kitchener, Ont.

Chesterfield chair and rocker from the De Luxe line.

The De Luxe Upholstered Line

The accompanying illustrations show three pieces from the line of the De Luxe Upholstering Co., Kitchener, Ont. This firm produces a quality line. Every attention is paid to all details of construction. The filling is composed of hair and moss, and every part is double stuffed. Spring construction is used throughout, and the cushions are of Marshall guaranteed construction. These pieces are produced in a well-appointed upholstering shop. and the workmen employed are experts in their line. Prompt deliveries are the order of the day.

Origin of Popular Textiles

Although clothing made of wool from the alpaca of South America—a grotesque-looking animal of the camel tribe, deer size—was worn in that country from remote antiqnity, not until the first half of the nineteenth century was alpaca wool brought to the knowledge of spinners in England. Titus Salt was the father of the English industry—and this by mere lucky chance or what the Americans would call Yankee shrewdness had Salt been born on their side of the little pond. For the gentleman had a mania for auctions, and at one in Liverpool stumbled upon an old consignment of the alpaca variety dumped upon the wharves months before. Considered virtually worthless, he bought it at a bargain and started in experimenting. So successful was the manufacturer in the results obtained that in 1854 he opened an alpaca factory, which in its top-notch days gave employment to as many as 4000 workers.

Later he made mohair plush on an extensive sale.

Serge has been used in Europe since the twelfth century.

Mohair, the fine silken hair of the Angora goat, was brought to London by the Turkey Company in the sixteenth century.

Calico was introduced into England from Calicut, India, by the East India Company, 1631. A picturesque story lies hidden in the commonplace of its name. For Calicut is a corruption of Calicoda, a Hindoo word meaning the "cock crowing," the town so called because the first monarch of Malabou ,India, as a reward to a war chief for distinguished service rendered in battle presented him with "all the land within the limit of which a cock crowing at a certain temple could be heard."

Chintz (Hindustanee chhint, now so used in decorations, meaning spotted) was originally the name under which all printed cotton cloth was exported from India.

While the fabric first came from India, the name gingham originated in the fact that its early European manufacture was at Guingamp, France—the forebears of the present day aristocratic ginghams, with their fine, beautiful texture, their artistic, complicated plaid designs, being very plain plebeian weaves with two or more colors in small checkered patterns.

The word dimity tells its own story when its name is parted in the middle, di and mitos the Greek for two threaded.

Some assert that the word lawn is derived from Laon, France, but a much prettier explanation for that dainty fabric is that the name was given because the delicate material was always spread out to bleach on smooth lawns, instead of upon coarse, ordinary grass.

Mohair plush took its rise in this country 1883 to 1910, New England leading in the race, Philadelphia leading in silk plush.

A Dependable Furniture Covering

A material that is rapidly coming to the front for use in covering furniture and similar lines is Fibro-hyd, an artificial leather, the product of the Fibro Manufacturing Co., Philadelphia, Pa.

Fibro-hyd is the result of many years of expert research. The first essential in the manufacture of artificial leather is anchorage—or adhesion of the coating to the fabric, second, the ability to produce a coating of maximum strength and resistance to wear. The most severe test for artificial leather is to use it on automobiles, where it is subject to extremely high temperature during the summer, and very low temperature in the winter. Under summer conditions, artificial leather must be made so that it will not spew, that is, the oil in its composition ooze out on the surface, or in winter that it will not crack and harden. Fibro-hyd is guaranteed absolutely not to spew. In the Spanish finish, this material is used very extensively for upholstering purposes in all its branches, and is said to be as satisfactory in every respect as grain leather. It is being sold extensively throughout the States, and very considerably in foreign countries, a very large shipment of which was recently sent to one of the Scandinavian countries, who report as follows:

"Fibro-hyd is considered by experts the best im-

That smile! H. R. H. the Prince of Wales during presentation of "Bywater" upholstered chair at the Canadian National Exhibition.

itation leather made to-day, and, therefore, should have a great sale."

Other lines manufactured by this company include Fibro-kane open webbing, Fibro-kane closed webbing, for suitcases and car seats, Fibro Flats for the manufacture of baby carriages, bassinettes, wicker baskets, etc., round reeds, for the same purpose, and paper twine in all sizes.

Value of Magnetic Hammer Criticized

Waterloo, Jan. 3, 1920

Editor, "Canadian Woodworker:"

In an article entitled "Is Specializing the Solution" which appeared in the Upholstering department of the November issue reference was made to the use of magnetic hammers to obtain speed and increase production. We have one man who uses a magnetic hammer but I do not think much of it.

For rough work they may be satisfactory if the boys are accustomed to use them, but I am inclined to think that it would take some time to become accustomed to their use.

On fine work there is a rabbet line which requires straight tacking. It is harder to drive tacks in a straight line with a magnetic hammer than when the ordinary kind is employed. On rough work the tacks are not usually straight, which matters little as the fringe is wide enough to hide all tacks that are out of line.

Yours truly,

E. Ruppel.

Kincardine, Dec. 27, 1919.

Editor, "Canadian Woodworker:"

An article in the Upholstering section of the November Canadian Woodworker referred to the use of the magnetic hammer as an aid to increased production. We have some men in our department who have used these hammers and to use their own term they "would not have the darn thing." They might be useful in places where it is hard to place a tack with the fingers, such as in small fancy pieces of upholstering, but for ordinary work they are likely to be more of a hindrance than a help.

I think where you would gain in one place through their use, you would lose in another, though a saving in time could probably be effected when working in corners.

Yours truly

J. C. N. Wellwood.

Securing Results with Enamel

Qualities of Flat Enamel—Every Coat Must be Carefully Applied—Condition of Stock Important

By Dixy Wells

In a recent article we gave the principal properties, contributing to success, that should be found in a first-class enamel—covering lustre, flowing properties, beauty of color, capacity, ease of application and drying ability.

To proceed further with the discussion of this subject, the flamboyant enamels were not particularly treated as they have only the properties of drying, lustre and flowing in common with the others. They are usually employed on tin, glass and other bright metals and are transparent, but very rich in color, producing satisfactory imitations of stained glass, lacquer, tinware, and are used on small metal furniture pieces, etc. They dry well in about eight hours, and may be baked if desired.

Should Have Uniform Lustre

Flat enamels are those which dry with a flat, egg shell finish, and are commonly used on furniture in place of flat paint, as they, as a rule, are able to withstand much more wear and tear. A good, flat enamel should possess these features—uniform appearance, ease of application, and should flow readily.

Having gone through a proper manufacturing process and been applied properly, a flat enamel should dry out with the surface quite devoid of gloss and with a uniform, eggshell lustre. If the enamel flashes after quick application it is generally defective. The ideal, flat enamel should look cool. By that we mean that it should not begin to set before sufficient time has elapsed to work it out properly. When applied to a panel, for instance, it should not begin to set for at least ten minutes, unless the temperature in the room is unusually high.

A good flat enamel should require little softening off, as it should of itself flow out well, evenly, smoothly, and set without showing brush marks, streaks, or any imperfections. Another essential property is opacity, and in cheap work its presence or absence may make all the difference between a good or a poor job, just as with gloss enamels this material is often used as an undercoater as it gives uniformity of color, and is expected to have as much body as ordinary flat paint. The above points may be tested, as outlined in our previous article covering gloss enamels.

Aside from the important qualities numerated above certain flat enamels must be able to withstand heat through the baking process, and tests along this line may be accomplished by enamelling small pieces of iron with the different goods to be used, and baking them at a similar temperature for a similar length of time, and noting carefully whether they lose their flat appearance and become darker in color. If they do they are defective for the purpose intended.

In applying ordinary cabinet enamels on furniture, first see that the surface to be finished is perfectly dry, sanded and free from grease, dirt and all imperfections. Practically all standard primers or undercoaters coming ready for use should be stirred thoroughly, and an even free coat given the surface, being careful to brush out the material thoroughly. Allow to stand for about twelve hours to become dry all through. Should there be any imperfections in the wood they should then be evened up with a plastic surfacer or filler.

After this, sand lightly with fine sandpaper, dust thoroughly, and apply the second coat of primer, following the system as given above. Should it be necessary, thin to the proper working consistency with turpentine. This second coat should be allowed to dry about twelve hours, and after this apply evenly and freely your first coat of enamel which should have been previously thoroughly stirred. Allow the enamel to dry about twelve hours if kiln dried, and about twenty-four hours if air dried, sand lightly, dust thoroughly, and give the second coat of enamel, if desired, following systems as above.

While these are ample directions in a simple way, they, of course, can be gone into in a much more thorough manner. To proceed, while the ground work for an enamel is usually a flat paint or a specially prepared undercoater, it, nevertheless, varies a great deal according to the class of work in hand.

Ground Work Claims Attention

Between the grounds of the poorest work and those of the best there is a great difference regarding the number of coats to be given and the kind of material used. The cheapest bringing up of the ground work is acomplished usually by the cheapest enamels, but quite apart from the quality of enamel employed, all enamelled work may be classed as good, bad or indifferent, according to the preparatory work and grounding it has received.

A cheap enamel on high-class ground work may not make the best job, but in many cases, gives superior results compared with the high-priced enamel on poor ground work, thus, there are grounds to suit various clases of work—low class, medium and high class. We will cover here only the latter, as quality is coming to be a paramount feature in the preparation of all painted or enamelled furniture.

The preparation and ground for this is very important. The surface should be thoroughly clean and sandpapered, and should, if possible, be done a day previous to the application of the first coat. It is advisable to consider grounding for high-class enamelling, the same as the ground work for high-class varnishes, for although the opacity of an enamel might render the identical number of coats unnecessary it can by no means make the ground smooth..

Work Should be Smooth

This is quite an important matter, for even though the ground may be brought to a uniform color, several

Drying Varnish in Eight Hours

Automatic Humidity Controlled Kiln Solves Varnish Drying Problems—Clean, Warm, Moist Air Used to Increase Production of Finishing Department—Giving Satisfaction in Up-to-date Plant

In the drying of lumber of various kinds it has been found that to secure satisfactory results a certain amount of moisture must be admitted or retained in the kiln and the same has been found to hold true in a varnish drying kiln.

Experiments have clearly demonstrated that when a varnished surface is exposed to a dry, warm current of air, the outside of the varnish will dry before the body of the coat, with the result that while the varnish may appear hard to the touch, yet underneath it is still soft. The admittance of a certain amount of moisture with the warm air retards the rate of drying of the surface and ensures that the varnish is dried from the bottom out and a perfect drying job is the result.

Modern Kiln Described

The writer recently inspected a modern drying kiln which the Heintzman Piano Co. installed some time ago. This kiln which is in the centre of their varnishing room and is a two compartment kiln 40 ft. by 60 ft., each being 20 ft. wide. It is of frame construction and sheathed in with Beaver-board. Three wide sliding doors are provided on each side and in the dividing partition. It is so arranged that the heat can be turned on and off each compartment at will. The reason for two compartments is so that one section can be drying while the other section is being filled with newly varnished material. The first three coats of varnish are applied by a DeVilbiss spraying machine, and as each piece is sprayed, it is placed on a suitable rack mounted on wheels. When these are filled they are run into the kiln. Each compartment holds a day's work so that one is drying while the other is being filled.

The accompanying illustration shows two views of the equipment which automatically contracts the temperature and humidity of this kiln. This equipment was manufactured and supplied by the A. S. Nichols Co., New York, whose advertisement appears in this issue.

Details of The Equipment

The two thermostats, one in each compartment, indicated by the figures 1 on the cut, project into each kiln and control the automatic heat regulating valve 2, which, in turn, controls the temperature of the heating coils through which the air is drawn. The figure 3 is the humidity control and acts on the steam valve 4. If the moisture contents of the air drops below the required percentage, the the steam valve at 4 opens and permits the steam to enter a coil which is placed in an open tank of water, over which the air is drawn. The admission of steam to this coil heats the water and causes an increased amount of vapor to be thrown off into the air as it is drawn past. As soon as the air reaches the required percentage of humidity, the steam valve automatically closes.

The air intake is at the left hand end of the equipment, shown dark in the cut. This end is covered by a wire screen, inside of which is a water screen. As the air passes through the water screen, all dust and other impurities are washed out. This is a very important feature as none but thoroughly clean air, air free from dust, should be fed into a kiln of this kind.

Air Thoroughly Washed

After going through the water screen, the air passes over the tank of warm water, absorbing the required amount of humidity, and then on in through the heating coils to the kiln. A fan, driven by a small motor, draws the air in and sends it into the kiln, giving a very positive circulation. When one stands in the compartment that is operating, a strong current of warm air is felt. The air enters at the bottom at one end and proceeds the full length of the

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.

kiln being exhausted through suitable ventilators situated at the bottom of the far end of the kiln.

A wet and dry bulb thermometer is conveniently placed in each compartment, one will be noted under thermostat in the nearer kiln. A temperature of 110 deg. is carried on the dry bulb and the wet bulb is held at 100 deg. The equipment is capable of very fine regulation, and when once set, carries on day in and day out with a minimum of attention.

As an aid to production and reduced manufacturing costs, the value of a drying system of this kind need not be dwelt on.

Securing Results with Enamels

(Continued from page 61)

coats may still be required, combined with thorough rubbing down to bring it to the desired smoothness. Six thin, hard-drying coats may be brought to a perfection of surface unattainable by the giving of three thick ones, and when the surface, color and smoothness are good to begin with, fewer coats will be sufficient, but, generally speaking, the lowest number suitable for the highest class of work is five, that is, three of the undercoating and two of the enamel.

On a good, properly prepared surface the first coat, then one of filling, a second coat, then another of filling, and followed by the final coat of enamel make very good work. Where more coats of filling are required or the old surface is to be quite changed in color a great many coats of paint or undercoats are sometimes necessary.

In all events, whether few or many coats are given, you must never forget that skillful application and sound preparatory work are great factors in the pursuit of success.

Southern Furniture Men Meet

The annual meeting of the Southern Furniture Manufacturers' Association was recently held at Asheville, N.C. A number of interesting addresses were delivered.

A. E. Tate of High Point, N.C., who recently returned from Europe, said that at present, due to industrial unrest in all European countries, caused by the war, and due to the high rate of exchange against these countries, they are only buying absolute necessities abroad. The rate of exchange against them is so great that they cannot buy from America without financial assistance. The matter of giving money aid to these countries is now being studied by our large financial interests, and some solution may be worked out. Mr. Tate is of the opinion that later on there will be an opportunity for the sale of American-made furniture in Europe, but believes that it is useless for us to attempt export unless we prepare for it by forming an export organization to study the question and assign a definite per cent. of our output for this purpose."

Another speaker pointed out the importance of keeping customers informed as to the market value of furniture by frequently issuing new price lists, although no goods may be sold on the new lists. They would enable the retailers to get the full market value for their goods. Dealers must get replacement value or they will eventually go under.

They don't ask any more, "Can he paddle his own canoe?" but "Can he afford a Ford?"

Comparative Material Prices 1916-1919

In a folder issued recently by the National Association of Chair Manufacturers the following outline of the material market was given. It shows how prices have advanced to present high levels. While the comparative figures given apply to the American markets they can be applied proportionately to conditions in Canada.

Through the latter half of 1918 the conservation program resulted in most chair factories reducing their stocks of lumber and other materials to less than the normal supply. Hence, there were no abnormal stocks inventoried last December. As the demand for chairs began to increase this year, the factories were compelled to enter the material markets and have found there a situation of increasing costs—notably in lumber. The last 60 days the advances in lumber have been terrific. Not only are the prices paid for lumber to-day exceptionally high, but the grades of lumber are of such inferior quality that the chair factory cuts more lumber to secure a given number of parts suitable for chairs than was the case two years ago. It should be borne in mind that, all four surfaces of every chair part are exposed in the assembled chair, and therefore have to be free from defects, and at present cost of lumber, this point should be fully appreciated.

The following table will convey some idea of prices being paid by chair manufacturers, and which in turn must be reflected in the price asked for the chairs when shipped.

Lumber, per M. Ft.	1916	1919	Increase Per ct.

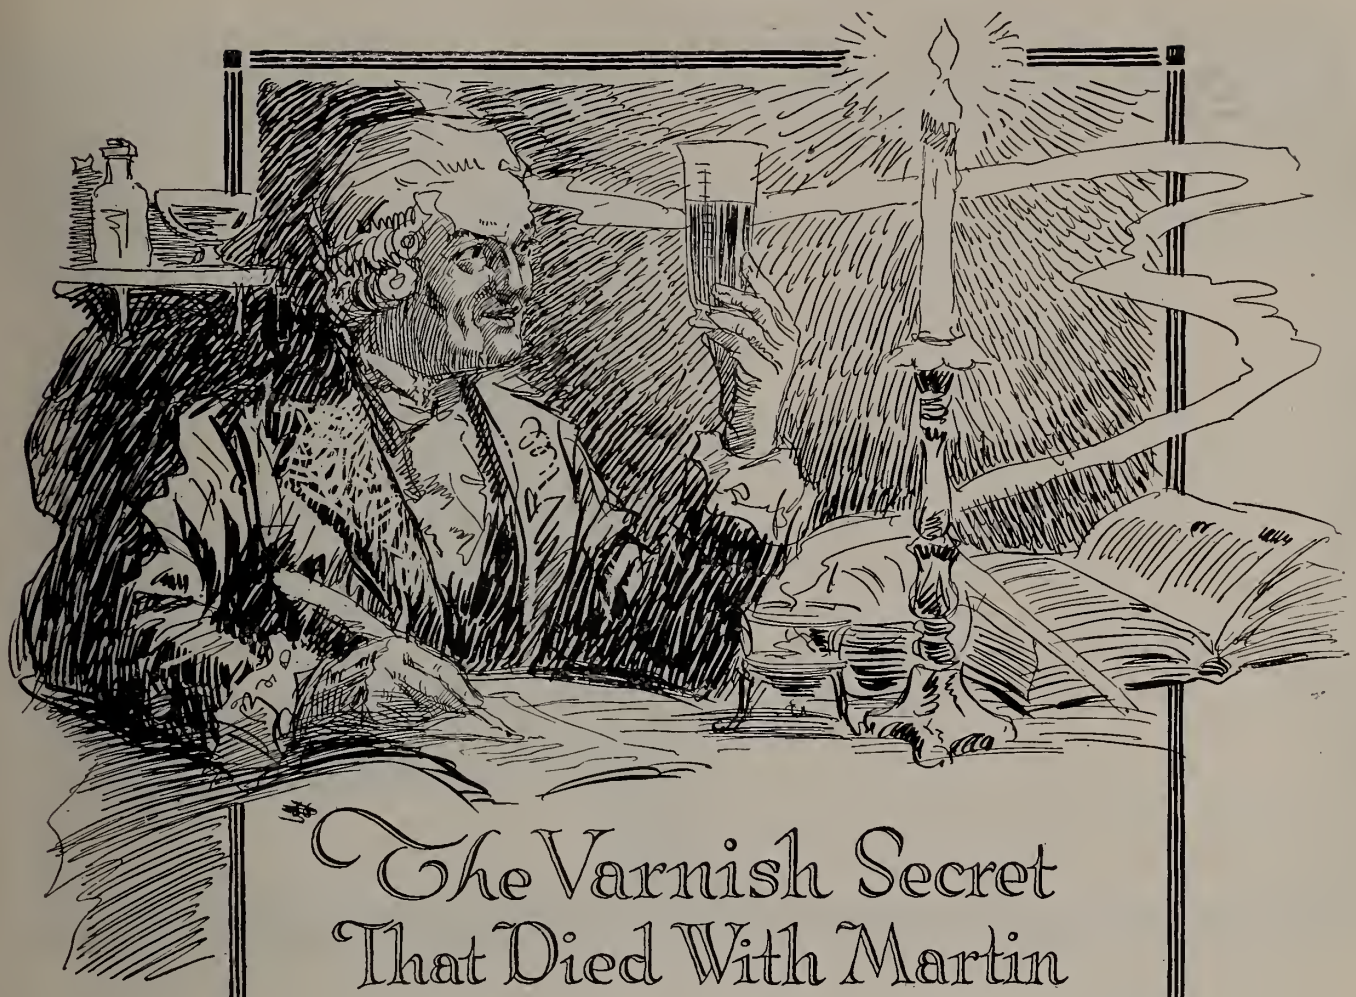
Catalogue of Finishing Materials

The Jamestown Wood Finishing Co., Jamestown, N. Y., have issued a new, nicely illustrated catalog covering their complete line of finishing material and finishing room supplies. Among the items described are analine oil stains, analine water stains, mahogany acid stain, fumed oak stain, powder stains, fillers, reducers, finishing wax, varnishes, first coaters, enamels, axlac, undercoaters, bronzing liquid, furniture polish, white paint and other lines. Copies may be had on request to the above mentioned firm.

The usefulness of your trade paper does not end with your reading it through. It should be passed on to the rest of the force and they should be urged to read it.



The Varnish Secret That Died With Martin

It was a rare formula that this 18th Century Wizard of wood finishers used to produce his masterpieces. But even with it, weeks of tiresome labor and months of curing were needed to bring out the full, deep lustre of the wood.
Martin never told his secret—it died with him.
Today there are few, if any, secrets of wood finishing. To secure the deep toned finishes that are so essential to your product you have but to turn to

MARIETTA
SPARTAN ART WOOD
STAINS

These stains are made by practical wood finishers—men as famed in their skill of today as Martin was in his.
Especially for finishing furniture and for piano and cabinet work of every kind Marietta Stains are pre-eminent. They meet the modern demand for speed, volume and speed in finishing. They are always practical, yet do not sacrifice that prime essential—beauty.
Our water and oil stains are compounded from the strongest dyes obtainable.
We invite you freely to consult our laboratories and service department.

Veneers and Panels

The Manufacture of Plywood

By S W Allen* and T R Truax †

The details of gluing, pressing, and drying plywood are not standardized, but these notes on manufacture are based upon observations of factory practice and upon extensive experiments at the Forest Products Laboratory.

The core or crossbands of the panels are coated with glue on a glue spreader consisting of two rollers, the lower one revolving in a bath of glue and the upper one sometimes being coated from another bath of glue retained between the upper roller and a trough with its lower edge almost touching the surface of the roller. The thickness of the glue layer is regulated either by scrapers or by the pressure of the rolls.

Panels Placed in Press Quickly

The panels are built up and placed in the press as soon as possible. Usually, with casein glues, the panels are grouped three to five in a set with caul boards placed between sets and at the top and bottom of the entire lot before pressure is applied. The panels are usually left under pressure for from 8 to 10 hours and are then taken to the drying room. Shorter pressure periods may be used when necessary.

One very successful factory using a casein glue has adopted the following standard practice, which is somewhat typical:

With 3-ply panels of 1/16-inch veneer, cauls are placed every five panels; with plywood of 1/12-inch veneer and three or more plies, cauls are placed every four panels. About five of these sets, or 20 to 25 panels, are pressed at one time. The time consumed between the gluing of the first panel and the application of pressure is 15 minutes. The panels are permitted to remain in the press for about 18 to 24 hours, but, if the plant is rushed and all presses are full, a press in which the panels have been pressed for at least 6 hours is opened and a new stack placed on top. (Retaining clamps could well be used instead).

With glues such as those of the blood-albumin type, demanding the use of a hot press, the glue is applied as in the case of cold glue and the panels placed one or two at a time in the hot press. Pressure up to 200 pounds per square inch at a temperature not to exceed 220°F. is applied. The panels are kept in the press for 2 to 5 minutes, depending upon the thickness of the plies and the panels and the type of caul that is used.

Calculation of Pressure in Hydraulic Press

For plywood manufacture determination of the correct amount of pressure to use is important. Results of experiments at the Forest Products Laboratory indicate that an excess or a lack of pressure tends to produce a weakened glue joint. Its determination on a hydraulic press equipped with a pressure gauge is simply a matter of calculation. With any hydraulic press, the amount of pressure secured per square inch of panel depends upon three factors: the area of the panel, the area of the piston or ram of the press, and the pressure gauge reading. The area of the piston in square inches multiplied by the pressure-gauge reading in pounds is approximately equal to the total pressure exerted by the plates. The total pressure exerted divided by the area of the panel in square inches gives the pressure secured on the panel in pounds per square inch.

The pressure-gauge reading must, therefore, vary with the size of the panels if the same amount of pressure per square inch is to be secured. For example, if the same gauge pressure is applied on panels 10 inches by 36 inches as on others 36 inches by 40 inches, the pressure will be approximately four times as great per square inch in the first case as in the second.

From the considerations mentioned above the following formulas for the calculation of pressures are derived:

$$P = \frac{P^1 \times A^1}{A} \quad 1 \qquad (1)$$

or

$$P^1 = \frac{P \times A}{A^1} \quad 1 \qquad (2)$$

Where P = gauge pressure in pounds per square inch
P^1 = pressure on panels in pounds per square inch
A = area of piston or ram in square inches
A^1 = area of panel in square inches.

To illustrate the use of the formulas let the following case be assumed: On a hydraulic press with a 10 inch piston, what pressure-gauge reading is ne-

*Industrial Examiner in Forest Products, Forest Products Laboratory, Madison, Wis.
†Wood Technologist, Forest Products Laboratory, Madison, Wis.

[1]To determine accurately the exact pressure secured, the weight of the platen to which the pressure is applied must be taken into consideration. For practical purposes, however, it may be omitted from the calculation, as inaccuracies in the gauge reading may account for much larger errors. When the weight of the platen is included the formulas become:

$$P = \frac{P^1 \times A^1}{A} \text{ plus or minus } \frac{W}{A} \qquad (3)$$

or

$$P^1 = \frac{P \times A}{A^1} \text{ minus or plus } \frac{W}{A^1} \qquad (4)$$

Where W = weight of the lower platen plus weight of panels or upper platen alone, as the case may be. The sign of the last member of equation (3) is plus when the pressure is applied by the lower platen and minus when applied by the upper. In equation (4) the reverse is true

cessary to secure 75 pounds per square inch on panels 24 inches by 48 inches? Use formula (1).

$$P = \frac{P^1 \times A^1}{A}$$

Here P = gauge reading required.
P^1 = 75 pounds per square inch
A^1 = 24 inches by 48 inches, or 1,152 square inches (area of panel).
A = 3.1416 × 5^2 or 78.54 square inches – the area of the piston[2].

Then $P = \frac{75 \times 1{,}152}{78.54}$ or 1,100 pounds per square inch, the required gauge reading.

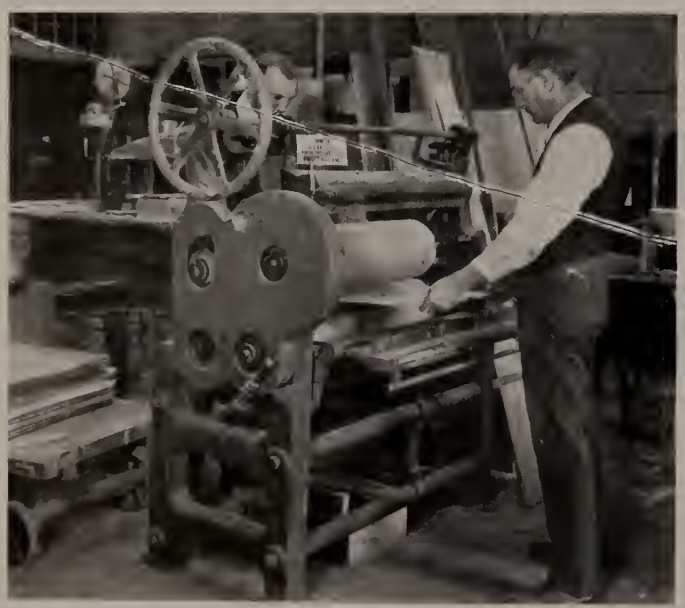
Suppose the operator of the press should use the same gauge reading of 1,100 pounds per square inch in pressing panels 8 inches by 36 inches, what would be the pressure on the panels in pounds per square inch? Here use formula (2)

$$P^1 = \frac{P \times A}{A^1}$$

Here P^1 = pressure actually secured on panel in pounds per square inch.
P = 1,100 pounds per square inch
A = 78.54 square inches
A^1 = 8 inches × 36 inches or 288 square inches

Then $P^1 = \frac{1{,}100 \times 78.54}{288}$, or 300 pounds per square inch, which is four times that used on the larger panels.

The necessity for calculating the required gauge reading for each size panel is thus obvious. A table, showing gauge readings to be used for all sizes of panels manufactured and for the different pressures used, may be computed and placed near the press



Glue spreader in operation.

where the operator can see at a glance the amount of gauge pressure required for every run of panels.

Reducing Moisture Content of Panels

Panels glued with wet glues take up a good deal of moisture and after coming from the press are placed in a kiln for final drying. One of the most successful manufacturers of panels dries them as follows: After leaving the presses, the panels are placed in a drying room having a temperature of about 90°F., and a humidity of from 40 to 45 per cent., with very little air circulation. The panels remain in this room for 3 or 4 days, depending upon their thickness. This firm has had little trouble with warping ,and its panels are exceptionally pliable.

Three-ply panels glued at low moisture content can be dried satisfactorily without particular care to regulate conditions. On the other hand, if the moisture content of the panel directly after pressing is up to 20 per cent. or higher, as a result of the state of the veneer and the type of glue used, conditions in

Type of hand press used in some plants.

the drying room or kiln should be carefully regulated to prevent checking. This means the maintenance of a low temperature and a high humidity. Panels dried to an abnormally low moisture content are, of course, likely to warp.

Method of Gluing Thin Veneer

Gluing thin veneer into a very thin panel of plywood has always been an extremely difficult matter for the manufacturer. The principal cause of trouble has been the excessive swelling of the thin plies due to the absorption of water from the wet glue, which causes overlaps and a considerable amount of wrinkling. A second source of trouble is in the handling of the very thin material when it has been coated with a wet glue, since it is very fragile and easily ruined when handled wet. These two troubles have made the manufacture of extremely thin plywood a very expensive process.

Since the aircraft work has become so intensive, an interest in this very thin plywood has sprung up. To help reduce the cost of such plywood and make more rapid production possible, work was undertaken at the Forest Products Laboratory to overcome the difficulties mentioned. A process was evolved which consists of making a sheet of glue by coating a tissue paper with blood-albumin glue, allowing it to dry and using the coated paper as the glue layer for plywood. The process of making the panel then consists in merely laying up alternately as many sheets of thin veneer and sheets of this glue tissue as may be required to build up the panel desired. These sheets are then pressed in a hot press. The result is a thin panel in which the moisture content has not been changed more than 1 or 2 per cent. This simple method eliminates the troubles resulting from the use of a wet glue, such as overlaps, open joints, and warping and twisting, and also makes the handling of the thin material an easy matter.

[2]The area of a circle is equal to 3.1416 times the square of the radius.

Can You Make a Shearing Test?

Tests That Can be Made to Determine the Comparative Values of Different Glues—Viscosity Forms Reliable Means of Comparison—Shearing Test Shows Up Fake Salesman

By John Welmers

Most every user of glue has at some time or other made or tried to make tests to see what particular advantage one glue had over another, or tried to find the value of different glues by comparison. The methods of testing vary, but regardless of the method every effort put forth is a step nearer the "good glue" goal.

There are glues of different values and various prices on the market, some of which are bargains and again others that would be folly to buy. Generally the glues made by reliable concerns are dependable, but still there is the question of what grade is it, or how much water will it take? It remains for the factory or users of the glue to experiment and find out for themselves all they wish to know about it; so a little information on how the glue user can set up his own standards and buy glue accordingly would not be amiss.

The methods of testing glues are comparatively simple and can be done by most anyone at a very small expense. The tests which are given here apply only to animal glue, with the exception of the adhesive test which can be used for all glues.

Testing For Viscosity

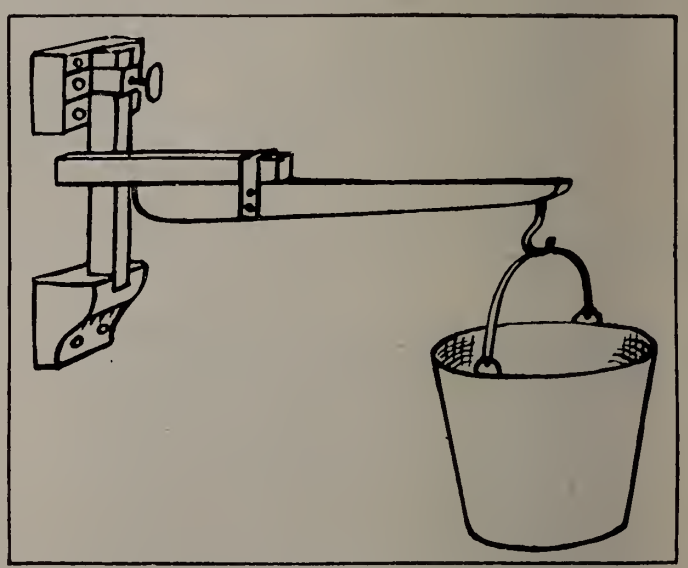
The visosity test is probably the most important test that can be given to animal glue. It is the test which determines the body of the glue, and as the strength of the glue depends largely on the body, it is easy to see why it is of importance. By studying and experimenting with the viscosity test, a chart may be worked up which will show the proper amount of water to mix with the different glues. The viscosity of animal glue is determined by the time a specified amount of the glue of a standard mixture and temperature takes to pass through a standard orifice. The time involved is the measure of its viscosity. A glass tube contracted at one end or a pipette such as will be found at a chemists supply house make good viscosimeters.

In order to make this test, the glue should first be mixed with water, the proper amount is determined by the kind of viscosmeter used. It the hole is small, a greater amount of water is better, while if the hole is large, a smaller amount of water gives good results. For a hole about ⅛ of an inch in diameter, a mixture of 1 part glue to 8 or 10 of water at 140 deg. F. will give a fair test. The glue should be allowed to stand until all the flakes or particles have softened to a spongy mass. It is then placed in hot water When it reaches the proper temperature, the test is made and the results tabulated. The big advantage of this test is that results may be secured quickly, whereas the jelly and adhesive tests require several hours.

Considerable reliance is placed on the jelly test by some, and it does form a very good basis for comparison of the body of different glues. To make this test, the glue is chilled to about 40 deg. F. in cups of standard size, and a round or blunt plunger weighing about 200 grams is placed on the surface of the glue and the distance it penetrates into the jelly is recorded. This measurement is called the jelly test. Any mechanic can make a little rigging which will do the stunt. The best way is to make a pedestal with a ring on the bottom to rest on the surface of the glue. The top of the pedestal may have a hole through which the rod on the plunger runs, and if the rod is marked, the depths may be easily read.

The finger test is frequently used by manufacturers of glue and is quite reliable. This is done by having several jars of the various glues placed on the table, together with jars containing standard samples. Then the glues are pressed with the first and second fingers, the samples matching with the standards are placed in standard groups. Contrary to the opinion of many, this test is very accurate, for the fingers are very sensitive and able to record slightly different densities.

Too much grease in the glue should not be tolerated for grease has no adhesive qualities. A little grease, however, does no perceptible harm. If a small quantity of aniline dye is mixed with some glue and spread on white paper, the grease, if any, will show up in small, white spots. The reason for this is that the grease does not mix with the aniline dye.



Method of making shearing test

Acid or alkaline glue is easily determined by dipping strips of red and blue litmus paper into the glue solution. If the glue is acid the blue litmus paper will turn red, while if it is alkaline, the red litmus paper will turn blue. A natural glue will not change the color of either paper. Preference should be given to a glue which is slightly acid, for it is not quite as favorable a medium for the growth of organisms which cause the glue to decay.

The foam test is made by beating some of the glue remaining from the viscosity test with an egg beater for a certain length of time. The height to

which the foam rises and the time it takes to subside, form the basis for comparison. A foamy glue is not desirable, for the bubbles get into the joint and cause spaces where there is no adhesive, thus reducing the glued area. A foamy glue is worse when used in a glue spreader, for it receives much greater agitation than if it were spread by hand.

Adhesion Test Not Favored

The adhesive test is the test that appears to be the most important in the eyes of many, but unfortunately, it is the test which is most inaccurate. As yet no system has been devised or made public whereby two joints made identically alike can be sheared or broken by exactly the same tension or exertion. The Forest Products Laboratory has made hundreds of tests with the same glue under identical conditions, to get an average result. It stands to reason if the laboratory with its elaborate testing machines cannot get anything more than an average, how can we with our simple home-made devices expect to get satisfactory results. But if average results amount are worth anything we can probably reap some benefit from our home-made instruments.

The accompanying sketch shows the method I employ and from which I have obtained fairly satisfactory results with all types of glues. The test pieces are made of maple or birch and are one inch square by about seven inches long. These pieces are glued crossing each other, as shown in the sketch, and are tested when thoroughly dry. They are placed in the bracket attached to the wall or post and the beam suspended on the horizontal member. A pail is then placed on the hook and slowly filled with an even stream of water, through a hose attached to a nearby tap. In this way there is absolutely no jarring. A box should be placed under the pail so that there is a space of about one inch for the pail to drop when the joint breaks.

Calculating The Breaking Strain

When the joint gives away the pail and water should be weighed and the result multiplied by the number of inches the hook is from the joint (in this case it is fifteen inches) to give the approximate strain on the joint. At least a half a dozen tests should be made to secure good results. This test is properly termed a shear test and is more fair than gluing two pieces together end to end. In the former the exertion is pretty well equalized over the one square inch, while in the latter the upper half is under tension and the lower half is under compression.

Of all the different tests in my estimation that for viscosity is the best and most accurate one from which to form a basis for buying animal glue, for if the same glue is tested under identical conditions, the results should always be the same. It is important, when buying glue, to test not only the sample, but also the lot that is purchased on the merits of the sample, to see that both are alike.

Recently an agent wanted to sell us some dope to mix with our vegetable glue. He claimed it would not only strengthen the glue but also cheapen it, for it would take a greater quantity or water. We tried the sample and tested both the sample and the regular stock on the outfit shown in the illustration and found that the joints of the new sample broke at about one-half the exertion that the regular stock did. Needless to say we turned the agent down.

Advantages of Redrying Veneers

One of the best practices in connection with the veneer industry is that of redrying the stock before using it. This not only insures having stock dry at the time of using but even though stock has been dried previously the redrying of it helps reduce the tendency to swell and shrink. Many times the user thinks his stock is dry when it contains enough moisture to cause trouble if used as it is.

Take, for example, flat stock that has been thoroughly dried, then shipped in and piled down flat in a basement or some storage room. This flat stock takes considerable moistures from the air on damp days. On dry days some of the moisture from the outside is given off again, but that which has found its way to the inside of the pile stays there. In fact, veneer that is flat piled and weighted down to straighten out the wrinkles, no matter how thoroughly it may have been dried primarily, will soon take in enough moisture to cause trouble unless it is redried before using.

Another good reason is that often veneer, like lumber, though it may come to the factory presumably kiln-dried or thoroughly air-dried, is too often not really dry; it needs the redrying process as a matter of safety and insurance.

Another good service rendered by the redrier is the flattening out of stock that has wrinkled in the proces of drying. It is almost imposible to thoroughly dry veneer except in some of the patent driers without wrinkles. These can be flattened out and made smooth by a trip through the redrier.

Working Thin Veneers

Thin plywood, made of two or three tissue-like sheets of veneer, is suggested by the Forest Products Laboratory, Madison, Wisconsin, as a material apparently having many possible applications. The new product is extremely light, strong, and flexible. It shrinks and swells very little with changes of moisture, and will withstand long continued soaking in hot or cold water. It can readily be made fire-resistant. Cloth, paper or wire screen may be combined with the veneer to increase toughness and resistance to tearing, and the plies may be arranged with their grains running at any angle, to give the plywood more strength in a particular direction.

A method of manufacturing extremely thin plywood has been worked out by the laboratory and will be explained in detail to anyone upon request.

On account of its fragility, thin veneer is difficult to glue with wet glue by the ordinary methods. It cannot be run through a glue spreader without first being reinforced. If the glue is spread by hand, the veneer absorbs water and swells excessively, producing wrinkles and poor joints. Large sheets of thin veneer, which are wet and heavy with glue, are almost impossible to handle without tearing.

The method of gluing developed by the laboratory avoids all such difficulties. The glue used is of the blood-albumen type. Instead of being spread directly on the veneer, it is spread on sheets of tissue paper. After the coated tissue is dry it is inserted between the sheets of veneer, and the joint is made in a hot press. The practicability of this process has been demonstrated by the manufacture of several thousand feet or thin plywood from 1-20-inch veneer.

Why You Should Use Thin Veneers

In Addition to Saving of Wood Effected the Glue Holds the Thinner Stock to Better Advantage

The popular idea that veneer is cut thin to economize in wood is correct; but it does not cover the entire matter. There are other reasons which when pointed out, should be readily understood by those conversant with veneer and its uses, even though they may not be so clear to a layman. One reason why face veneer is thin is because it will hold and stay put better than if it is in thick sheets. Take as an example a job in fine matched, crotch mahogany. If a job of this kind were made in veneer 1/8 inch thick the chances are it would not be so good a job after finishing as if made with a sheet of veneer 1/30 inch thick.

The reason is that the glue with which the joint is made will hold the thinner face veneer more firmly, and thus prevent shrinking and distortion which might result in open joints. There is room for some argument on this point, but in the main it all sums up in this: A thin sheet of fine face veneer is held by the glue with exactly the same power that the same glue will hold a thicker sheet. In taking up moisture during the gluing process and in drying out afterward, which causes swelling and shrinking, the thicker sheet, being a heavier body, will not only take in more moisture, but it will exert more pressure in various directions, and generally as a result will develop more cracks and checks in the finished face than if thin veneer is used.

There is a point here for those to consider who are prone to kick about veneer being so thin that it sands through on the face and gives trouble generally. You will usually find, that the finest faces in veneer are made of very thin stock, and this is not altogether because of a desire to economize in timber, making the fancy figured wood cover as much surface as possible. Saving wood and getting more figure is one object but not the only one in making veneer thin. Most of the figured wood gets its figure because of distortion in grain, and, because of this distortion it has very poor structural qualities, therefore. thickness would add little to the strength. Finely figured veneer is a face product and can be kept in better shape if cut very thin.

In the cutting of common veneer for centres and backs, the matter of thickness is governed by other factors, but even there a general tendency toward thinner work is seen, because it is found that bulk is not always an advantage. However, it is in the cross-banding and face veneer that we have the real thin stock and it is here also that we have the question of why veneer is cut thin.

Some arguments may be adduced for and against the use of thin cross-banding, but perhaps the best evidence of quality in thinness within certain limitations is found in the fact that the experienced veneer workers are to-day using thinner cross-bandings than were used some years ago. Formerly 1/16 inch cross-banding was used but to-day, it is used 1/20 inch or even thinner. Here, as in the case with the face veneer, is an evident advantage aside from the saving of wood, otherwise the more experienced users would not be adopting this thin cross-banding.—Hardwood Record.

Three Ply Wanted in Australia

An Australian importer who annually handles large quantities of three-ply material, has written the Canadian Trade Commissioner at Melbourne, Aus., as follows:

"We have had considerable experience with 3-ply timbers for many years past, and we find that 72-inch by 36-inch by 1/8-inch and 3/16-inch are the most suitable sizes, and we feel sure that if the Canadian manufacturers can make a cheap 3-ply in these sizes, either in cottonwood or any other cheap timber, that considerable business could be done in this country.

"We might mention that we have for some years past been handling the cottonwood 3-ply from Canada, but have not been able to get sufficient supplies at reasonable prices. nor have we been able to get the sizes which we mention, as our suppliers insisted on us taking a range of sizes of 60-inch by 36-inch to 66-inch by 42-inch. While we have found these sizes not altogether unsuitable, cannot too strongly recommend you to impress upon your manufacturers the necessity of quoting for the particular size asked for, that is 72-inch by 36-inch, and if they are prepared to do this, we would be able to handle some millions of feet each year.

"Regarding quality we understand that the cottonwood 3-ply is manufactured in four grades, and we find that the third and fourth grades are the most suitable here, because the price is more reasonable than the higher grades."

Serious Shortage of Veneer Logs

At the meeting of the Veneer and Panel Manufacturers' Association, recently held in Chicago, a number of veneer manufacturers spoke on the seriousness of the log situation. It transpired that certain mills were forced to suspend operations, while others had sufficient logs on hand to last for periods up to sixty days. Taken as a group it was estimated that the veneer manufacturers had about two months' work ahead. Not only are logs hard to obtain, but unheard of prices are being asked. In certain districts poplar suitable for veneers has been quoted at $100 per M. in the log, with gum at $90.00 and choice oak at $125 per M. Even in districts where logs were comparatively plentiful high prices prevailed.

Abounding Prosperity in Canada

Having completed a tour of Canada as far as the Pacific coast, which included twenty-seven cities, after an absence of eight years, Harrison Watson, Canadian Trade Commissioner, and senior of the commissioners in England, on the eve of returning, said he was greatly struck with the great prosperity of the country as a whole. In fact, this very prosperity. said Mr. Watson, rather hindered the promotion of Canadian export trade to Great Britain, for he had come across manufacturers who had been eager to get orders from Britain a year ago, to-day regretting having accepted them, as they found they could command higher prices here.

A sanding belt works best when it has a cushion under it. A sanding belt lasts twice as long when it is worked so it can give under any undue pressure.

In estimating how long a sanding belt will last, its length and width should be taken into consideration.

Brief Review of 1919 Lumber Market

Figures Showing Comparative Stocks and the Enhanced Values of the Various Hardwoods—Latest Carload Quotations on the Chicago Market

As far as hardwood lumber was concerned, the year 1919 was one of surprises. The buyers, who early in the year figured on abundant stocks and decreasing prices, suddenly awoke to the fact that the available supply of manufactured hardwoods was not sufficient to meet the demand and that prices were soaring rapidly. This condition exists even to-day, so that we find that on certain items, such as gum and oak, the quotations are still climbing.

The statistical department of the American Hardwood Manufacturers' Association have prepared a series of charts which show the fluctuations in prices and stocks on hand for the past season. The following figures pertaining to the different woods were taken from these charts. The prices are figured on the Cincinnati basis:

Stocks and Prices of Oak

The stock of quartered red oak on hand in January, 1919, totalled 3,688,000 ft. In July this had been reduced to 1,626,000 ft., while in November it had increased to 3,080,000 ft. At the same time the price of F.A.S. increased from $76.00 to $204.00. No. 2 common and better, from $60.00 to $173.00; No. 1 common, from $52.00 to $156.00; No. 2 Common, from $36.00 to $65.00. Plain red oak stock in January, 54,560,000 ft., and in November, 1919, 57,779,000 ft. The price varied during that period from $71.00 to $134.00 for F.A.S., $46.00 to $103.00 for No. 1 Common; $45.00 to $87.00 for 2 common and better, $34.00 to $63.00 for No. 2 common. Quartered white oak, stock January, 1919, 11,942,000 ft. November, 11,078,000 ft. Price of quartered F.A.S. increased from $108.00 to $256.00; No. 2 common and better, from $86.00 to $201.00; No. 1 common, from $75.00 to $174.00; No. 2 common, from $43.00 to $94.00. Plain white oak stock, January, 1919, 104,222,000 ft.; November, 1919, 55,873,000 ft. Quotations increased from $66.00 to $146.00 for F.A.S., $41.00 to $99.00 for No. 1 common, $39.00 to $86.00 for No. 2 common and better, $31.00 to $66.00 for No. 2 common.

Changes in the Gum Market

The stocks of plain and quartered red gum were not included, but the prices increased from $52.00 to $166.00 for quartered F.A.S., $48.00 to $129.00 for plain F.A.S., $41.00 to $132.00 for No. 1 common quartered, $40.00 to $101.00 for No. 1 common plain, and from $38.00 to $62.00 for No. 2 common plain.

The sap gum stocks were reduced from 138,488,000 to 89,042,000 ft. in November and prices increased from $51.00 to $92.00 for wide box boards, $46.00 to $79.00 for narrow box boards, $35.00 to $69.00 for F.A.S., $29.00 to $53.00 for No. 1 common, $27.00 to $35.00 for No. 2 common.

Figures Covering Other Woods

The stocks of ash show a marked depletion. In January, 1918, they stood at 16,025,000! They had been reduced to 8,860,000 ft. by November, 1919. The price on F.A.S. rose from $93.00 to $177.00; on No. 1 common from $76.00 to $128.06, and on No. 2 common from $42.00 to $56.00.

Chestnut stocks stood at 33,969,000 ft. in January, 1919, and increased to 36,600,000 ft. in April, and then declined to 29,506,000 ft. in November. F.A.S. prices rose from $56.00 to $97.00, No. 1 common from $40.00 to $71.00, No. 3 common and better from $36.00 to $52.00, and sound wormy from $36.00 to $48.00.

A similar situation exists with regard to poplar. The stock in January, 1919, was 30,835,000 ft. This was increased to 32,435,000 ft. in March, and dwindled to 26,950,000 ft. in November. Prices increased from $86.00 to $134.00 on F.A.S., from $60.00 to $78.00 on No. 1 common, and from $44.00 to $51.00 in the case of No. 2 common.

Recent Chicago Quotations

A price list recently issued in Chicago gives the following quotations for carload lots on the Chicago market: Quartered white oak, 1 in., 1st and 2nd, $300.00; quartered red oak, 1 in., 1st and 2nd, $250.00; plain white oak, 1 in., 1st and 2nd, $180.00; plain red oak, 1 in., 1st and 2nd, $175.00; red birch, 1 in., 1st and 2nd, $165.00; unselected birch, 1 in., 1st and 2nd, $150.00; red gum, 1 in., 1st and 2nd, $175.00; sap gum, 1 in., 1st and 2nd, $100.00; yellow pine, 1 in., B. & B., $115.00

Conditions Governing European Demand for Hardwoods

Mr. N. B. Mitchell, representing the Gayoso Lumber Company, of Memphis, Tenn., has just returned home on the Steamer Lapland after an extended trip in the interests of his company to the United Kingdom, and various countries on the Continent, including France, Belgium and Holland.

Upon being interviewed, Mr. Mitchell states that he found conditions at the present very chaotic. The British Isles have been flooded with large consignments of hardwoods by exporters, who were willing to take a long chance, and this in connection with the fact that there has been a decided fall in pounds sterling, and an unwillingness on the part of the English buyers to take the risk of exchange, makes conditions so far as immediate business is concerned practically impossible.

On the Continent, and especially in Belgium, he found conditions quite different. Belgium has no large stocks of hardwoods and is really in need of large amounts of building material, but with francs around 8.45 the Belgians find it practically impossible to purchase on anything like a large scale. The Belgians express themselves as being hopeful that their financial condition will be greatly benefited by the recent visit of King Albert to the United States, as it is rumored that their king expected to make certain arrangements while here which would better their finances.

On the whole it is Mr. Mitchell's impression that as soon as the present congested conditions are relieved in the British Isles and a better rate of exchange is to be had, there and on the Continent, it will be possible to do a large and profitable business in Southern hardwoods.

We Are Doing Everything Possible To Meet Demand
Supply and demand for hardwoods are equally beyond human control. The causes are obvious to the experienced. May we state though that while even our vast organization has fallen short of complete success in meeting the issue, we are doing everything humanly possible to speed up; we are even enlarging our facilities in order to more fully live up to our reputation as
Exponents of the Golden Rule in Business.
Anderson-Tully Co.

News of the Trade

The Otto Higel Co., Limited, Toronto, are installing a new dry kiln.

John H. Hughes, Stayner, Ont., recently purchased an Elliot Combination Woodworker.

The Nelson Lumber Manufacturing Co., Nelson, B.C., are constructing a new woodworking factory.

Chesley Chair Co., Limited, Chesley, Ont., are in the market for a two spindle horizontal boring machine.

Incorporation papers were recently taken out by the Northern Box Co., Ltd., Edmonton, Alta., capital $20,000.

Dominion Glass Co., Limited, Hamilton, Ont., are erecting a one-storey brick building 60 x 80, to be used as a box factory.

R. Truax & Sons, Walkerton, Ont., are erecting a sash and door factory and are in the market for the necessary equipment.

Batts Ltd., West Toronto, are planning on building an 80-foot addition to their plant. This will be used as a cutting-up room.

The plant of the Wilkin Co., Limited, Adamsville, P.Q., hub manufacturers, was completely destroyed by fire. Will probably rebuild.

The Sheppard & Gill Lumber Co., Drayton Ave., Toronto, contemplate the erection of a new planing mill and woodworking factory.

The Summerland Lumber Co., Summerland, B.C., recently purchased a site, with trackage, for the purpose of erecting a box factory.

The Valley City Seating Co., Limited, Dundas, Ont., have secured the contract for the desks for the House of Commons building at Ottawa.

The Phonola Company of Canada, Limited, Kitchener, Ont., manufacturers of phonographs and records, are moving their head office to Eimira, Ont.

A large number of patterns and some machines were badly damaged by a fire which occurred in the pattern shop of the Katie Foundry Co., Galt, Ont.

A new saw factory is to be erected on Granville Island, Vancouver, B.C., a permit having been taken out by T. H. Tait, manager of the Aetna Saw Works.

Wm. Dawe & Sons, Bay Roberts, Newfoundland, have installed a veneer manufacturing plant and are producing veneers in various grades and thicknesses.

The planing mill of the McKinney Lumber Co., Woodstock, Ont., was recently destroyed by fire. The loss is $25,000, and is partially covered by insurance.

The Office Furniture & Supplies Co., Limited, Brockville, Ont., are making changes in their plant that will enable them to double their present output.

The Baetz Bros. Specialty Co., Ltd., Kitchener, Ont., manufacturers of parlor and table lamps and other specialties, are moving their plant to larger quarters.

C. F. Smith, Harrow, Ont., contemplates erecting and equipping a new planing mill. It is not anticipated that this work will be undertaken before the spring.

The McDonald Mfg. Co., Carlyle, Ont., are manufacturing a line of wooden toys. They report that they have not been able to supply the demand for their product.

P. E. D'Anjou & Fils, Ltd., Rimouski, P.Q., has been formed with a capital of $399,900, to deal in wood, and to establish shops for repairing and manufacturing wood.

D. S. Lawson, 119 Board of Trade Bldg., Montreal, is desirous of getting in touch with any Canadian firms who are interested in exporting their products to Belgium.

H. Leir, Penticton, B.C., is planning on erecting a box factory in the near future. It is anticipated that the new plant will be in operation in time to take care of the demand for fruit boxes during the coming sesaon.

The new box factory, plant No. 2, of the B. C. Manufacturing Co., New Westminster, B.C., will have double the capacity of the plant now in operation. It is anticipated that this factory will be running early in the spring.

Recent Toronto registrations include the American Phonograph Co., the Brilliant Phonograph Corporation, the Davies Toy Mfg. Co., and the Reliable Show Case & Store Fixture Co.

The Potvin Box Co., Blind River, Ont., have taken over the building formerly occupied by the White Pine Lumber Co., and are remodelling it to suit their requirements.

The Aerial Transport & Taxi Co., Ltd., Winnipeg, Man., have been incorporated to manufacture and deal in aeroplanes, and to engage in commercial flying of all kinds. Capital $75,000.

The Ivey Storage Batteries Ltd., Toronto, Ont., have been incorporated to manufacture and deal in storage batteries. Capital $500,000. P. D. Ivey and A. M. Ivey are two of the incorporators.

The Norton Company of Canada, Limited, Hamilton, Ont., have been incorporated to manufacture and deal in abrasives, grinding wheels and all articles of abrasive material. Capital $500,000.

The Gray Furniture Co., Ltd., Neustadt, Ont., has been incorporated to manufacture and deal in furniture of all kinds. Capital $25,000. J. C. Heuther and W. Heuther are among the incorporators.

W. Lee, Aylmer, Ont., has purchased the planing mill formerly conducted by H. Z. Balcom, and intends to convert it into a plant for manufacturing kitchen cabinets and other forms of woodenware.

The Harris Wood Products Co., Ltd., Toronto, have been incorporated to carry on a general woodworking business. Capital $100,000. J. F. Lucas and C. A. St. C. McKay are among the incorporators.

The E. B. Eddy Co., Limited, Hull, P.Q., have put a 43½ hour week into effect. In addition wages have been increased so that while fewer hours are being worked the employees will receive more money.

McKechnie Music Co., Ltd., Ottawa, Ont., have been incorporated to manufacture and deal in musical instruments of all kinds and to take over the business now known as the McKechnie Music Co. Capital $40,000.

The Esmond Co., Ltd., Adamsville, P.Q., have been incorporated to manufacture and deal in handles and other wood products, and to take over the business of the Esmond Co., Adamsville, P.Q. Capital $20,000.

The Shaw Baby Carriage Specialists, Vancouver, B.C., dealers and manufacturers in baby carriages and similar lines, recently erected a factory at West Burnaby, B. C. Operations will commence in the near future.

Lumber is not the only commodity increasing rapidly in price at the present time. During the last few months ground wood pulp has jumped from $26 a ton to $50, an advance of nearly 100 per cent., and the end is not yet.

The Peterboro Paper Box Co., Ltd., Peterboro, Ont., have been incorporated to manufacture and deal in boxes of wood, paper and fibre. Capital $50,000. G. M. Gordon and J. A. O'Brien, of Peterboro, are two of the incorporators.

The Coulter Wood Products, Limited, Hamilon, On., have been incorporated to manufacture and deal in wood products of all kinds and to take over the planing mill and business in Hamilton conducted by W. P. Couter. Capital $50,000.

The Hall & Brown Woodworking Machine Co., St. Louis, Mo., have issued a very useful 1920 wall calendar. The illustrations found on each leaf give an idea of the completeness of the line of equipment manufactured by this firm.

Canada Box & Lumber Co., Quebec, P.Q., has been incorporated to manufacture and deal in wood boxes and all other articles made of wood. Capital $49,000. L. J. Conway and H. R. Van, of Quebec, are two of the incorporators.

The Palmer & Parker Company, Boston, Mass., wholesale lumber and veneers, have issued an attractive and useful wall calendar. The figures are large and easily distinguished. It is just the calendar a busy man wants for his office.

The B. C. Industrial Commission has granted a loan of $15,000 to the Western Toy & Furniture Mfg. Co., Ltd., Vancouver, B.C. This company was recently formed by twenty returned soldiers, who were eager to get in busi-

Accurate Costs

You can only secure cost control by using International Job Time Recorders. That will prevent what is possibly the greatest leak in your business, namely, difference between your productive labor and non-productive labor.

You will make more real money and secure larger dividends from an investment in our Job Time Recorders than anything else you can buy in the way of factory equipment today.

We are selling these recorders in lots of from one to fifty at a time, by telephone, by telegraph, and by mail. If it pays others, it will pay you. Why not be influenced by successful firms, thousands of which use our Cost Recorders.

With our Recorders, the labor cost is a printed record and cannot be changed.

See facsimile of Job Card illustrated at the right.

ness for themselves. They raiseed $14,500 in eash, which, together with the $15,000 advaneed by the government, will be used for equipping a plant and putting the eompany on a producing basis.

The building of cooperage in Prince Rupert is a probability in the near future. It is the intention to lease the sash and door faetory whieh has been elosed down for several years and which was started by the late C. D. Band, of Vaneouver.

A new basket factory is to be established in Thessalon, Ont., in the near future. Mr. Asam, who has been operating a small faetory near Roek Lake, Ont., has aequired the site of the old Gordon Mill in Thessalon, and will erect a suitable faetory.

The W. F. Vilas Co., Limited, Cowansville, P.Q., have been incorporated to manufacture and deal in furniture, sehool and offiee desks and fixtures and wood products of all kinds. Capital $500,000. H. F. Vilas, Cowansville, is one of the ineorporators.

The Dominion Lumber & Building Co., Orillia, Ont., recently ereeted a new factory whieh is fully equipped to take care of milling in transit, resawing and the manufaeture of sash, doors, interior trim and hardwood flooring. J. J. Wilson is manager.

The Peerless Phonographs Ltd., Toronto, Ont., have been ineorporated to manufaeture and deal in phonographs, talking maehines and all form of musieal instruments; capital $40,000. M. Crabtree and J. Parker, barristers-at-law, are two of the ineorporators.

The I. X. L. Manufaeturing Co., Ltd., Palmerston, Ont., have been granted a charter to manufacture and deal in lumber, woodenware, and any article made of wood. Capital $40,000. J. Youngson and C. Forrest, of Palmerston, are among the ineorporators.

The Wiarton Furniture Co., Ltd., Wiarton, Ont., have been ineorporated to manufaeture and deal in furniture, eabinets, store and offiee fittings, sash and doors and wood produets of all kinds. Capital $200,000. G. E. Reekin and C. Hill are two of the ineorporators.

The Safepaek Mills, Boston, Mass., have issued a booklet entitled "How to Build a Box," which deseribes the different forms of boxes and tells how boxes should be construeted to give a maximum of serviee and safety. Copies may be had from the above mentioned firm.

The Offiee Speeialty Mfg. Co., Newmarket, Ont., has taken over the building known as the New Royal Hotel, and is remodelling it for offiees. When the alterations are complete these offiees will be utilized by the company instead of the offiees at the plant, as at present.

Garloek-Walker Maehinery Limited, Toronto, was recently ineorporated with a eapital of $500,000, to manufacture and deal in maehinery and equipment of all kinds and to take over and earry on the business now known as the Garloek-Walker Maehinery Co., Limited, Toronto.

La Compagnie de Meubles Canadienne, Ltd., has been ineorporated to deal in every deseription of wood and manufaeture sawn lumber; to operate planing, saw and pulp mills; and to manufacture doors, sashes, and furniture. The capital is $99,000, and the head office in Quebec city.

Recent Montreal registrations inelude the Pratte Pianos Co., of Montreal, Limited, the Ineomparable Phone Cabinet, the Canadian Sehool Furniture Co., Etherbridge Bros., manufacturers of toys and furniture, Clement, Meunier & Co., show ease manufaeturers, and the St. Lawrenee Box Co.

The Casualties Reed & Rattan Co., Limited, Kingston, Ont., who were recently ineorporated, with a eapital of $40,000, have about completed their factory and will be producing a eomplete line of reed, rattan and fibre furniture, including baby earriages and novelties, in the near future.

The Megantie Broom Mfg. Co., Limited, Lake Megantic, P.Q., are eutting 1,500,000 feet of hardwood this winter. This stock will be used in the manufaeture of clothes pins. The present daily production of their plant is 50 doz. brooms, 400 veneer cheese boxes and 1200 gross of elothes pins.

The Sehool Board of Victoria, B.C., have purchased the following equipment from the Canadian Puget Sound Timber & Lumber Co., of that eity, a band saw with motor, a rip saw and an 11 ft. jointer. These maehines, whieh were used in the box plant of the C. P. S. mill, will be installed in the technieal sehool which is being established in Victoria.

The Sherloek, Manning Co., of London, Ont., have practieally eompleted arrangements for the purehase of the plant and business of the Doherty Piano Co., of Clinton, Ont. It is not antieipated that any ehanges will be made in the Clinton plant, but the two faetories will be operated under one management.

It is understood that a eontrolling interest in the Harriston Furniture Co., Harriston, Ont., has been purehased by Lieut. George Zeigler and E. L. Zeigler. Lieut. Zeigler, who served overseas, has been manager of the Bank of Nova Seotia at Brigden, while E. L. Zeigler is viee-president of the Waterloo Furniture Co., Limited, Waterloo, Ont.

The Curtiss Aeroplanes & Motors, Limited, Toronto, who have been manufaeturing a line of phonographs in their plant on Dufferin St., are vaeating these premises. They plan to continue the manufaeture of phonographs and will equip a new plant, the loeation of whieh is not definitely deeided on. It is likely that a definite announcement will be made in the near future.

Firstbrook Bros., Limited, Toronto, Ont., are ereeting and equipping a box faetory at Thessalon, Ont. The factory is nearing eompletion and the maehinery will be installed at an early date. This plant will manufacture about 8,000,000 feet to 10,000,000 feet of lumber into box shooks annually. W. R. Benson, superintendent of the Toronto and Penetang plants, is looking after the new braneh.

The Listowel braneh of the Karn-Morris Piano Co., which was recently taken over by a new organization, has been put into operation. About 25 hands are employed at present and the number is being rapidly increased. It is expeeted that this plant will be operated to capaeity inside of a month. A. E. Windsor is manager. Additions to the plant and equipment are contemplated.

The Toronto Speeialty Mfg. Co. of Toronto have aequired the plant in Brandford, Ont., formerly operated by Watsons Ltd. It is their intention to fit up this plant to manufaeture their line of reed baby earriages and doll earriages and other forms of reed furniture. The equipment required is already installed in this plant with the exception of a dowel maehine, whieh may be added in the near future.

The building of the lumber manufacturing and dry kiln plant adjaeent to the drydoek site at Prinee Rupert has now reaehed a point that will enable operations to start within a few weeks. Approximately $86,000 has been expended on the plant to date, and the total outlay will amount to $150,000 when eompleted. Major Cowper-Young, formerly assoeiated with the Imperial Munitions Board, is head of the new enterprise.

The employees of the Hespeler Furniture Co., Hespeler, Ont., were reeently entertained in the showrooms of the eompany. A Christmas tree was in evidenee and gifts were distributed to all present, the men reeeiving a box of cigars, while the women were given a box of chocolates. In addition suitable gifts were distributed among the children present. About 400 were entertained and a very pleasant evening was spent.

A. Barthelmas and J. E. Hoare, of the Ceeilian Piano Co., are negotiating to aequire the plant of the Karn-Morris Piano Co., Woodstoek, Ont. An option has been taken on this plant and a proposition made to the City Council of Woodstoek, asking for a loan of $28,000 to refit the plant. A by-law to this effeet will be plaeed before the ratepayers, and, if earried, the plant will in all probability be in operation in the near future. The new eoncern will be known as the Karn Manufacturing Company.

A eompany known as the Golf Mfg. Co., has been organized to manufaeture golf shafts. They have seeured a contraet from an English house for a large number of these shafts, in the rough. The plant, which ineludes a speeial automatie lathe and swing cut-off and rip saw, was purehased from A. R. Williams Maehinery Co., and will, in all probability, be loeated in Peterboro. As soon as an adequate supply of hickory is assured, additional equipment will be added. They expect to eommenee manufaeturing about the end of January.

Shipbuilding appears to be very brisk in Nova Seotia, the following firms having boats under eonstruetion:—W. R. Huntley & Son, Parrsboro, N.S., a four-masted sehooner; J. W. Kirkpatriek, Parrsboro, N.S., has laid the keel of a four-masted vessel. O. A. Hamm, Mahone, N.S., is completing one vessel and will immediately start work on another. The McLean Construction Co., of Mahone, N.S., have com-

menced the construction of a freighting vessel. The Ernst Shipbuilding Co., Mahone, N.S., and the Bridgewater Shipping Co., Bridgewater, N.S., are each building a fishing vessel. J. N. Rafuse & Sons are building a schooner at Salmon River, N.S.

Personal

Jos. Kenehan, Jr., carriage manufacturer, Montreal, P. Q., recently passed away in that city.

Wm. Robertson, of Toronto, British Columbia Lumber Commissioner for the East, spent a few days in Montreal lately, calling upon the trade.

C. W. Bell, Ingersoll, Ont., recently passed away. He was widely known throughout Western Ontario and at one time operated a large planing mill.

Frank A. Kent, managing director of Seaman, Kent Co., Limited, Toronto, manufacturers of hardwood flooring, etc., is around again after his recent illness.

Olaf Nerby, superintendent of the Wilson Box Factory, St. John, N.B., was recently presented with a very fine smoking set by the employees of the factory.

George A. Christopher, Ingersoll, Ont., recently passed away in his 88th year. He was engaged in the contracting business and for a long period operated a planing mill.

G. Lippert, C. Baetz and A. Schrieter, furniture manufacturers, of Kitchener, were the recipients of civic honors in the recent elections, having been elected to the city council.

James C. Scott recently passed away in Toronto. Mr. Scott was a well-known Toronto woodworker, having founded the general woodworking business known as J. C. Scott & Co., some forty years ago.

M. Uhrig has resigned his position as finishing room foreman at the Walkerton plant of the Knechtel Furniture Co., and has taken a similar position with Krug Bros. & Co., Limited, Chesley, Ont.

D. Yager, one of the foremen in the Listowel plant of the Andrew Malcolm Furniture Co., was recently given a pleasant surprise when the men in his department presented him with a pair of gold cuff links and a Masonic watch fob.

Prior to his departure on a trip to England, H. A. Grimsdick, managing director of the Bell Piano & Organ Co., Limited, Guelph, Ont., was presented with a cane and smoking set by the employees of the company. Mrs. Grimsdick and their son Master Derek were also remembered. In expressing his thanks, Mr. Grimsdick referred to the excellent progress made by the Bell Company during the last few years.

Exhibition of Timber and Timber Products

The British Trade Commissioners in Canada have been notified by the Department of Overseas Trade of the British Government that the Department are organizing an Exhibition of Timbers grown within the British Empire to take place in London from the 5th day of July to 17th, 1920.

The classification embraces: (a) Specimens of Timber (polished and unpolished); (b) Exhibits demonstrating the various uses to which timbers are put, viz:—floors, panelling, staircases, furniture, ply wood, and other articles of every day use; (c) Wood pulp.

The main object of the Exhibition is to bring prominently before architects, inspectors, firms who have to specify timbers in their contracts, as well as the users and consumers of timbers, the full range of Imperial grown timbers and especially those timbers which up to the present are only very slightly, if at all, known in this country, and at the same time to demonstrate the chief uses for which such timbers are suitable.

A catalogue will be issued giving full particulars of all exhibits displayed, and in order to arrive at uniformity in the compilation of this work it is suggested that at least the following information should be inserted:—

(a) A short concise statement regarding each kind of timber exhibited, showing the size in which it is usually obtainable, and the purposes for which it is specially suited; also giving the following particulars, viz—
1. Weight in lbs. per cubic foot.
2. The result of tests carried out with regard to; Tension ,compression, both with and across the grain, Detrusion, Modulus of Rupture, Modulus of Elasticity, Fire Resistence.

(b) A list of the shippers of the various kinds of timber in each of the Dominions.

(c) A list of importers and large timber merchants in the United Kingdom who would be prepared to supply the various timbers to users in this country.

It is hoped that the Catalogue will not only be useful to visitors to the Exhibition but will in future serve as a book of reference on all commercial timbers grown within the British Empire.

The British Trade Commissioners in Canada are as follows:—G. T. Milne, O.B.E., 367 Beaver Hall Square, Montreal; F. W. Field, 260 Confederation Life Building, Toronto; and L. B. Beale, 610 Electric Railway Chambers, Winnipeg.

Tasteful Calendar for 1920

The Canadian Woodworker is in receipt of a beautiful calendar, compliments of the Laidlaw Bale-Tie Co., Limited, Hamilton, Ont. The scene depicted shows Pocahantas, the daughter of an Indian chief, being brought captive to Jamestown. It is an incident closely connected with the fortunes of the Virginia colony of early English settlers, and the artist has made the most of his subject. The body of the calendar lists the products of this firm, which include wire nails, staples, wire barrel hoops, bale ties for box shooks, etc., and wire of all kinds for mattress manufacturers, brush and broom makers, etc.

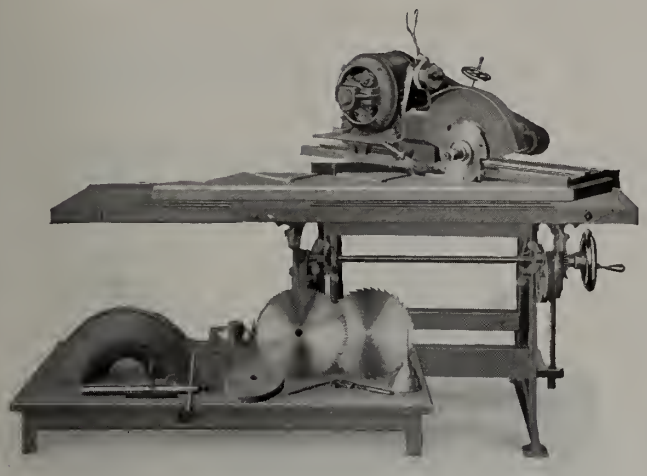
Will Some Reader Help?

A firm of cigar box manufacturers in Montreal want suggestions for the profitable working of the waste lumber produced in manufacturing their line. This material which is approximately ½ in. wide ⅛ in. thick and from 3 to 5 feet long, consists of basswood, spruce, cottonwood and cedar.

The publishers of this journal will be very grateful to any reader who will send in a practical suggestion.

Gentlemen, the demands that some of the radicals are making cannot be satisfied with increased wages, for they demand nothing less than turning industry over to them. There is no justification for that kind of partnership, for the only kind that is successful in business is that which is earned and paid for.—Chas. Piez, President of Link-Belt Co.

A leading business man said the other day there was nothing more discouraging than a competitor financially embarrassed—no, nothing, except being financially embarassed yourself.



ELLIOT WOODWORKER. (Made in Canada)

The Elliot Woodworker

Will Save You a Quarter of Your Labor and Material Cost by Efficient Operation.

Elliot Woodworkers will give you perfect service for cutting Joist, foot plumb and side cuts of Jack and common Rafters, use up cuttings for bridging, make all your drawers, cupboard doors, door and window frames, house out stair-stringers, dado, groove, miter, bore and run mouldings. Transportable and easy to operate.

Elliot Woodworkers operate from the ordinary lighting circuit or any electric power.

Let us send you further particulars regarding the merits of these machines.

1—No. 313 C.M.C. 6" Four-Sided Moulder. Price, $425.00.
1—American Heavy 4" Four-Sided Moulder. Price, $400.00.
1—No. 638 C.M.C. Saw Table. ... Price, $145.00.
1—No. 620 C.M.C. Saw Table. Price, $200.00.
1—No. 616 C.M.C. Saw Table. Price, $350.00.
1—Yates 48" "Royal Invincible" Three Drum Sander, Roll Feed, just like new. Price, $1,500.00.

The above prices are F.O.B. cars Montreal.

We will gladly send descriptive circular and any other information upon request.

WILLIAMS & WILSON, LTD.,
84 Inspector St.,
Montreal, Que.

Trend of Machine Wood-working

In the present trend of machine woodworking there is a noticeable current of drift toward the producing of finished parts at the saw mills and central assembling points in the timber territory, and shipping them to the original factory for assembling and finishing. This seems partly due to the passing of the timber supply in the older manufacturing territory, calling for a long freight haul on the raw material, and partly to specializing in the making of various items.

Chair stock and furniture parts especially, are now being made and shipped in the white to central assembling plants, whereas a quarter of a century ago these parts were in the main made at one central factory from standard lumber stock and a small percentage of special dimension sizes. If the present tendency keeps up we will soon be to the point where most of our machine wood-working of the factory class will be in the making of parts as a distinct and specialized business.

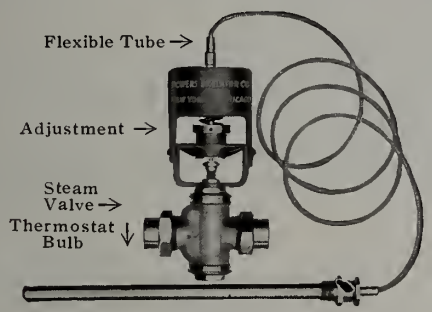
Reduce Your Fuel Costs

Right now is the time to make every lump of coal do its full duty. Utmost fuel economy is assured by equipping all your dry kilns, glue kettles, varnish rooms, dry rooms, hot water tanks, etc., with

Powers Heat Regulators



Powers Regulator No. 11

Our No. 11 Regulator is entirely self-contained, requiring no outside power for operation. Automatic, reliable and accurate. Peculiarly adapted to the control of liquid temperatures, in hot water tanks, glue kettles, acid baths, etc.

Our Bulletin 138 tells all about it. Sent on request.

It is Economical

A Powers Regulator saves fuel and material by allowing only **necessary** heat to be used on the job. That insures a coal saving. No material ruined by **overheating** or **underheating**. The Powers Regulator never forgets nor procrastinates. It does what it is set to do and does it every time.

It Standardizes Results

"Powers" uniformity in temperature insures uniformity in your product. You can know what your results are to be—no frail mortal's memory is depended upon.

Your Plant Needs Powers Service

All the work in your plant where heat is a factor, should be under Powers control. It is automatic, efficient, economical.

Consult Us

Our experience of more than thirty years in heat regulation is at your service. During that time we have gathered facts that are vital to your business. Write us freely; ask us as many questions as you wish, and we will give you accurate information and intelligent advice.

Act Now

MACHINE MOLDER PRACTICE

CHAPTERS

The Alignment of a Molder
Setting Up a Molder
Planning Set-ups and Selecting Knives
Balancing Molder Knives
Making Under-Cuts and Dovetail Grooves
The Use of Special Guides and Forms
Special Surfacing and Milling Knives
Running Molding Face-Down
Braces and Knives for Heavy Work
Making Moldings in Multiples
Miscellaneous Molder Work
High-Speed Molder Work
Knife Making
Babbitting High-Speed Bearings
Belting and Installing Molders
Molding Shapes

The Molderman—Because he can find in it the best methods practiced by expert moldermen in plants working all kinds of patterns. Will increase his efficiency.

The Foreman—Who sometimes is called on to operate or set-up the molder can get suggestions to cut down his time spent at the machine.

The Superintendent—Being responsible for production, this book will enable him to find out if maximum results are being obtained, that no loss is suffered by poorly maintained equipment or injudicious handling of stock.

The Owner—Can get an idea from each chapter and see if applied to his own class of work whether production can be speeded and good lumber saved.

The Machinery Salesman—Can get acquainted with the molder in a practical way—know what he is selling and offer helpful suggestions to the trade.

The Apprentice—Can save several years' time required to learn what can be learned from this book in a week.

Every Woodworker—Can become a more all-around man if he knows more about the molder and molder work.

160 Pages, 100 Illustrations.

Flexible Red Leather Binding. $2.50 Postpaid. Remit by Money Order.

PRACTICAL BOOKS CO., Box 372, Indianapolis, Ind.

"Has Lowered the Cost of Our Production"

That's what one of our customers in Texas says about the H. & B. No. 147 Hollow Chisel Mortiser—the vertical, hollow-chisel, foot-lever feed machine for general use in both hard and soft wood that has made good in practical, every-day service in some of the best equipped mills and factories in the country and is recommended by users for big production of quality work at low cost.

No. 147 Hollow Chisel Mortiser

makes cuts of any size, length, shape or depth within its capacity and leaves the sides and corners clean and true and bottom square, requiring no hand-finishing. Takes chisels up to ¾-in. square and mortises up to 3½ inches deep, exact depth being adjustable at will. Either belt or motor-belt drive. Plain or compound table.

Stroke of spindle 3½ inches—depth can be regulated to exact point desired by means of adjustable stop. It's a machine that merits investigation.

Get all the facts—write for prices and circular.

Vegetable Glues

Do you know that VEGETABLE GLUES may be made in all the varying qualities found in ANIMAL GLUES, such as HIDE GLUE, BONE GLUE, GELATINE, etc., each class having its special and widely different qualities according to the purpose for which it is to be used?

If, therefore, you are interested in the question of the use of ANIMAL or VEGETABLE GLUES, of any kind in industrial work, we ask you to communicate with us, advise us of your exact wants, both in the matter of character of work and cost limits, and we will supply you with JUST WHAT YOU WANT.

Remember that there is NOT ONLY ONE quality of vegetable glue, but just as many grades as in animal glue, and that the selection and use of a vegetable glue requires the same care and knowledge as the use of an animal glue.

Only with a knowledge of this fact can you secure the ideal product for your line of work, or reduce its cost to a minimum.

Let us have your inquiry, if interested in the subject, and an opportunity to PROVE TO YOU that we can serve you to better advantage to yourselves both in the matter of cost and excellence of work turned out, than any one else now engaged in this field of research and application.

We only ask your inquiry and an opportunity, AT OUR EXPENSE AND COST, to demonstrate to you that we understand our business in every detail and can make it to your interest to deal with us.

We operate under our own patents and guarantee full protection to all users of our Glues.

Fibre

First Quality Material for Fibre and Upholstered Furniture Manufacturers

Good Furniture is Only Made From Good Materials, Well Selected Carefully Handled and Inspected

In selecting your Fibre Cord and stakes for Fibre Furniture you can secure no better material than that which we produce. Our Cord is carefully watched throughout the entire process of manufacture and kept uniform in strength. It is giving perfect satisfaction.

Our Uniflax Seaming Cord for Upholstered furniture is unexcelled. It serves the purpose perfectly and lasts indefinitely. Prices for these materials are commensurate with the quality and are withal very reasonable.

GRAND RAPIDS FIBRE CORD COMPANY

1101-1157 Elizabeth Ave. **Grand Rapids, Michigan**

SIMONDS SAWS AND KNIVES

The woodworkers' friend. They are satisfactory and guarantee the best results. Made of Simonds Special Crucible Steel, they are evenly tempered, uniform in construction and have the cutting qualities.

We make all kinds of Saws and Knives for either wood or metal cutting

SIMONDS CANADA SAW CO., Limited

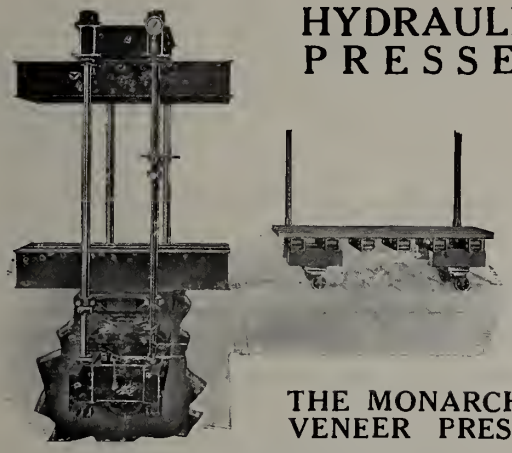
PROTECTION—

Safety First! How often have we heard or seen this phrase, yet daily, yes, and oftener, accidents are occurring. Silver's Round Safety Cylinder will protect the operators of any of our new jointers from needless injury. They are greatly appreciated by the operators of these machines and they help wonderfully to increase production. Write us for descriptive matter regarding our complete line of machinery that will interest you.

The Silver Mfg. Co. Box 370 **Salem, Ohio, U.S.A.**

FARQUHAR
HYDRAULIC PRESSES



THE MONARCH VENEER PRESS

CONSIDER THESE FEATURES.

Heavy Steel Strain Rods.
Steel Cylinder and Detachable Saddle.
Cylinder Repackable without removing Ram.
Double Steel Head and Base.
Quick - acting Pump, Rigid Construction.
Operating Valve at Press.
Improved Retainers.

OUR HYDRAULIC VENEER PRESSES are built to suit all requirements. All proportions are very liberal, while material and workmanship are the best throughout

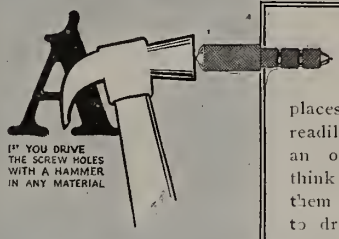
Pressure of 100-lbs. to the square inch is applied to the veneering surface. Stock is handled by the renowned retainer system, unsurpassed for both efficiency and economy.

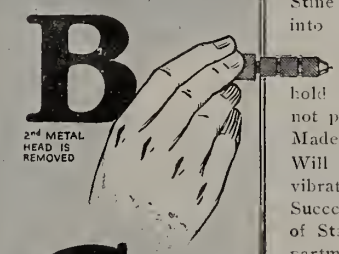
With our process, but five minutes intervene from the time the car enters the press until the stock is released and the press is ready for the next load.

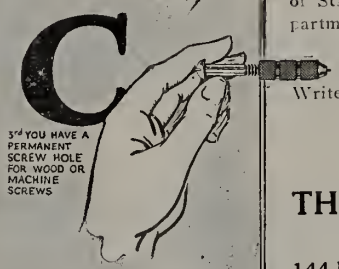
Catalogue, giving full particulars as to sizes and specifications, free on request. We also manufacture all kinds of special Hydraulic Presses to order. Write us concerning your requirements.

A. B. FARQUHAR CO., LTD., Box 171, YORK, PA.

It's Easy as







Just look how easy it is to use Stine Screw Holes! And there is no end of places where you need them. They readily go into any material where an ordinary screw will go, but think of the places you can use them where it would be impossible to drive a screw.

Stine Screw Holes can be moulded into rubber, fastened into metal, fibre, concrete, marble or glass without plugs. They hold with an everlasting grip—can not pull out and will not wear out. Made in all standard screw sizes. Will hold parts permanently against vibration and other severe strains. Successfully tested by the Bureau of Standards. Used in various departments of the U. S. Government.

Write for suggestions and samples.

GOODYEAR
MADE IN CANADA

EXTRA POWER BELTING

You can find no safer guide in selecting your belting equipment than the experience of others.

In over one thousand of Canada's plants Goodyear Extra Power Belting is being used with marked success. Scores of these have written us telling of their experience with Extra Power Belting.

Read this letter from The Dominion Steel Products Co., Limited, of Brantford, a concern noted for its progressive methods. It tells of a belting experience which must impress you.

Price was a minor factor with Dominion Steel Product, but on this alone they made a saving of $4,000.

Length of service, general efficiency, continuous operation and power saving were the determining factors in their decision to use only Extra Power Belting in their plant.

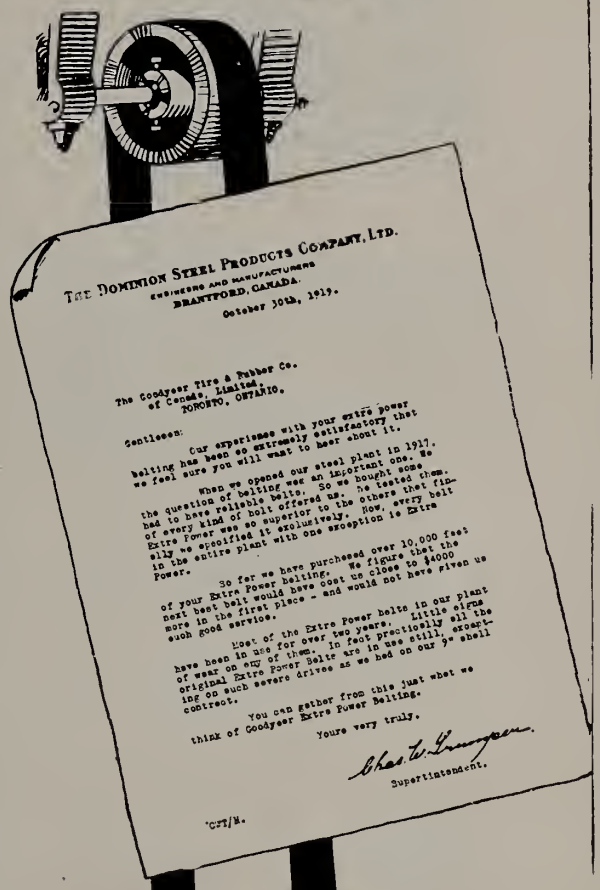
It may be that your plant is much smaller; that your saving would only be $400, but even this plus the greater efficiency of Extra Power Belting is too important for you to disregard.

You can easily prove to your own satisfaction that Extra Power would serve you as faithfully as it has the Dominion Steel Products Co.

Phone, wire or write our nearest branch, so that a man carefully trained in belting problems by Goodyear may call on you and present further evidence of the superiority of Extra Power Belting. No obligation other than fair investigation.

THE GOODYEAR TIRE & RUBBER CO. OF CANADA, LIMITED

Branches—Halifax, St. John, Quebec, Montreal, Ottawa, Toronto, Hamilton, London, Winnipeg, Regina, Saskatoon, Edmonton, Calgary, Vancouver. Service Stocks in smaller cities.



THE DOMINION STEEL PRODUCTS COMPANY, LTD.
ENGINEERS AND MANUFACTURERS
BRANTFORD, CANADA.
October 30th, 1919.

The Goodyear Tire & Rubber Co.
of Canada, Limited,
TORONTO, ONTARIO.

Gentlemen:

Our experience with your extra power belting has been so extremely satisfactory that we feel sure you will want to hear about it.

When we opened our steel plant in 1917, the question of belting was an important one. We had to have reliable belts. So we bought some of every kind of belt offered us. We tested them. Extra Power was so superior to the others that finally we specified it exclusively. Now, every belt in the entire plant with one exception is Extra Power.

So far we have purchased over 10,000 feet of your Extra Power belting. We figure that the next best belt would have cost us close to $4000 more in the first place - and would not have given us such good service.

Most of the Extra Power belts in our plant have been in use for over two years. Little sign of wear on any of them. In fact practically all the original Extra Power belts are in use still, excepting on such severe drives as we had on our 9" shell contract.

You can gather from this just what we think of Goodyear Extra Power Belting.

Yours very truly,

Chas. W. Grumpen
Superintendent.

CWT/M.

Reduce the Fire Hazard

Floors and machines covered with sawdust, chips or shavings, increase the fire risk in woodworking plants.

A spark from defective wiring or a hot bearing on a machine might cause a disastrous fire.

Insurance Companies invariably reduce the premiums where adequate precautions have been taken to prevent fires.

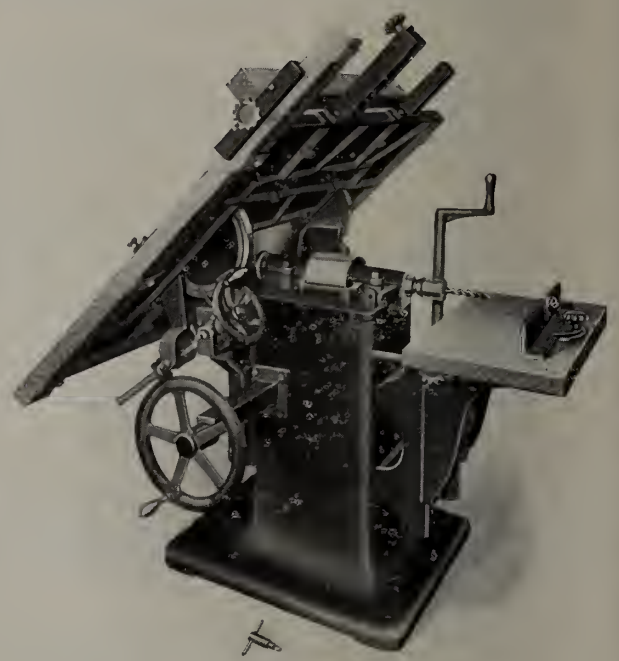
The Canadian Standard Reversible Mill Exhauster will remove all of litter directly from the machine and at a very low up-keep cost.

Why not write for sure information. Will be glad to mail you Catalogue 410-13—gives detailed information.

The Canadian Blower & Forge Company, Ltd.

Kitchener, Ont.

An Excellent Machine for Furniture and Cabinet Work



The "Famous" No. 16 Variety Saw Bench with boring and mortising attachment will do much to increase your output in your furniture and cabinet shops. Accuracy is a main factor in its operation, while the roughest class of work is handled with the same degree of efficiency.

Write us for further information regarding the "Famous" No. 16 Variety Saw Bench and many other machines that you may need and are included in our complete line of woodworking machinery.

"INTERNATIONAL"
Electric Glue Heaters

Fireless Cooker construction holds glue at correct working temperatures without guess work.

Operates on less current than any other electric glue heater.

CLEAN — SAFE — ECONOMICAL

International Heaters are portable—fit any lamp socket. Three heats—high, medium and low. Rapid melting, uniform temperature control. No skin, scum or dirt. No burnt glue.

Built in sizes for all classes of shops—from one pint to fifty gallons. Heavy spun copper construction. No seams or soldered joints. Dry heat. No water bath.

Follow the example of prominent concerns everywhere —specify "International" on your next order. Write for booklet—"Correct Temperature in the Glue Room."

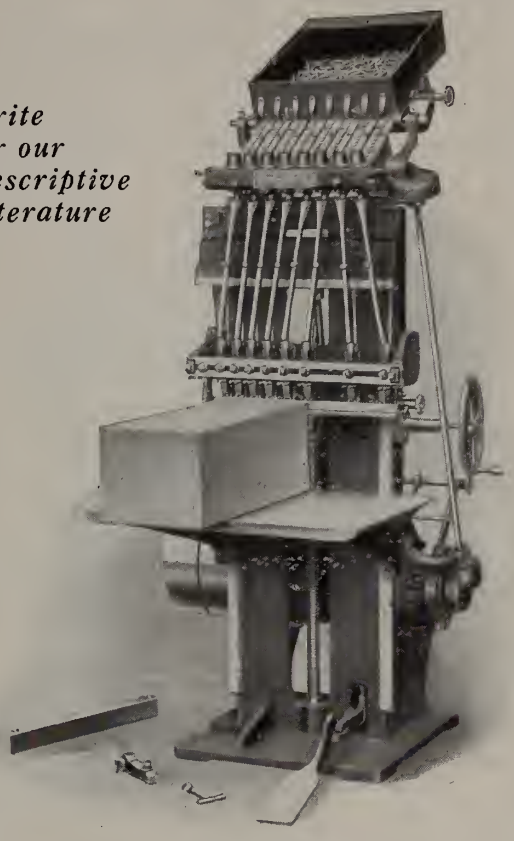
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

Why Do These Firms Use the OLSON FRAME EXTENSION?

The reason is plain—greater haulage at less expense and the assurance of easy running and the elimination of breakage. Olson Frame Extensions for your Ford Trucks will solve the problem of transporting bulky, fragile or perishable products. Olson Frame Extensions are ideal for the transportation of lumber, furniture, etc.

Let us send you further information. Write us today.

Olson Frame Extensions are sold by all Ford dealers. May we send you some copies of recommendations?

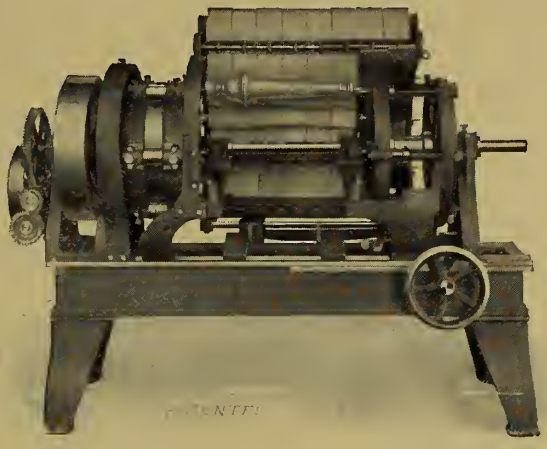
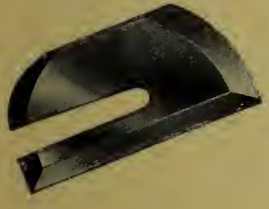
Paying for Something You Do Not Own



That is precisely your fix if you are sanding your furniture turnings by hand, when the Nash No. 10 Sander would do the work much better and cheaper.

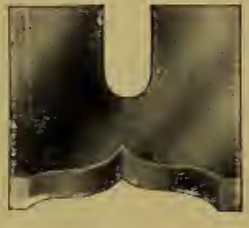
J. M. NASH, Milwaukee, Wis.



ATKINS

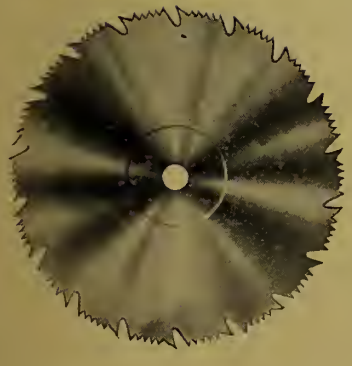
STERLING QUALITY

SAWS and KNIVES

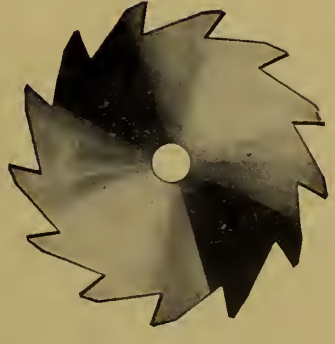


mean continuous, efficient work and 100 per cent. production.

The extraordinary demand for more buildings and homes means that the Lumber output must increase.



Atkins Sterling Quality Saws and Knives will assist you in making the year 1920 the biggest and best in the history of your business.



Write to-day for our Knife Booklet "C W" and Pattern Template Paper.

E. C. ATKINS & CO.

Makers of Sterling Saws

Factory—HAMILTON, Ont. **Vancouver Branch—109 Powell Street**

- hand - Sanding at Machine Speed

Conserving Labor with Our

"138" Standard Hand Block Belt Sander

AND besides eliminating practically all hand work on flat and curved surfaces, the "138" will finish to better advantage much work that is done in a way on other sanders.

Even a small boy can operate it successfully and do the work of 4 to 8 men sanding by hand.

Why not send a postal for our new "138" circular describing clearly how the saving in labor pays for this sander in a few weeks?

THIS machine, combining as it does, mile-a-minute sand belt travel with the principle of hand-sanding, makes the most practical all-round type of sander for the average shop. In a factory where high-paid cabinet makers waste at least a third of their time sanding and scraping by hand, this "138," operated by ordinary workmen, will eliminate 90% of that waste.

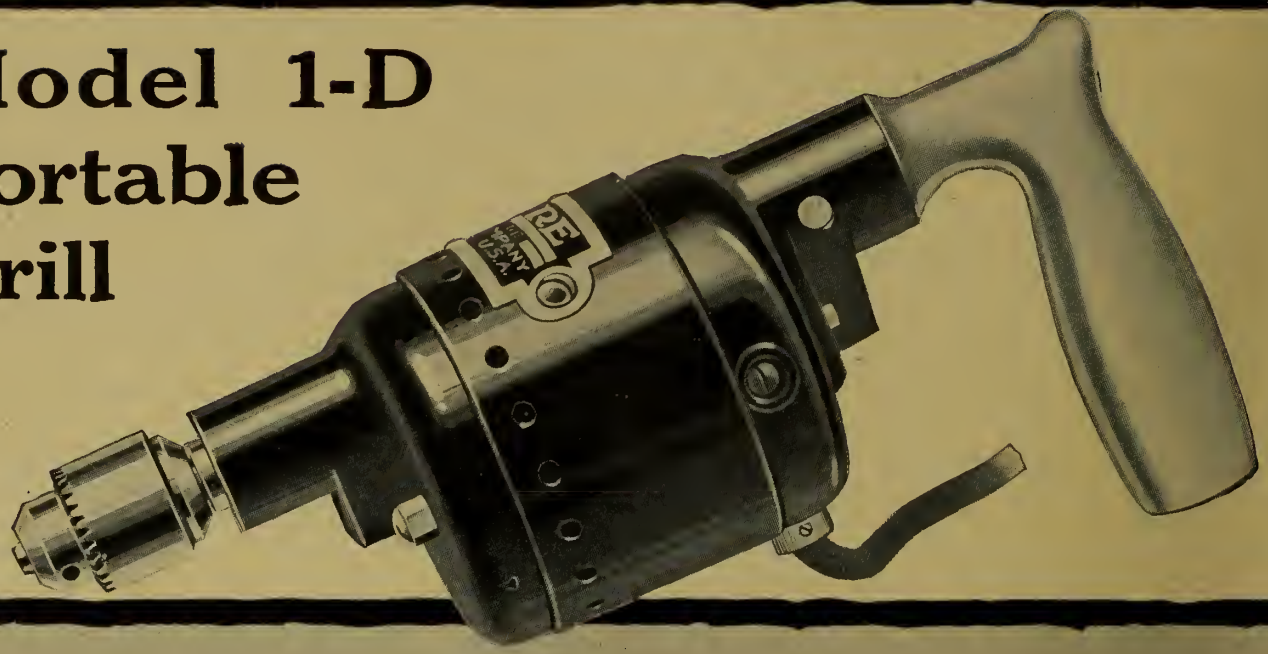
Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to 3/16". Wood and alloys, 0 to ½".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center ⅜".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

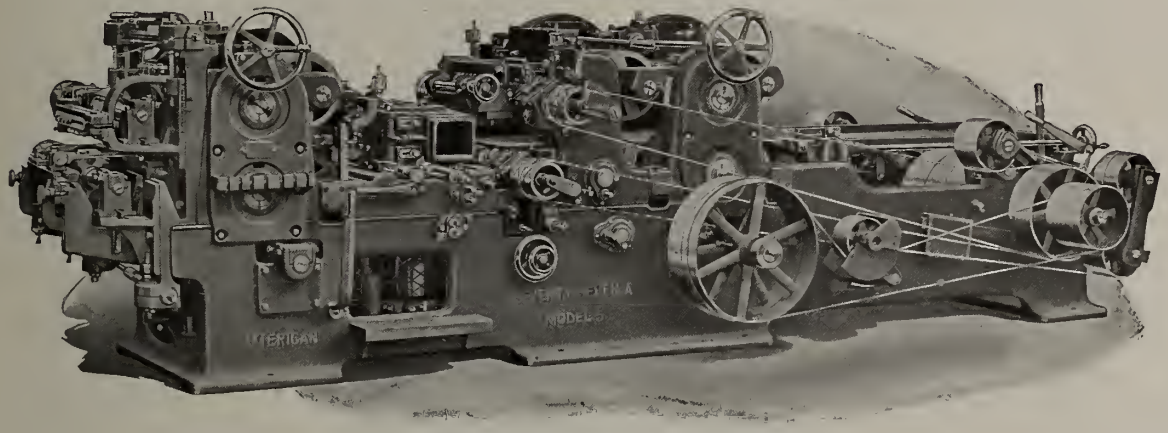
DUMORE GEARED ELECTRIC DRILLS

First in Quality

American Woodworking Machinery Co.

Rochester, N.Y.

LONDON AGENTS—THE PROJECTILE CO.



American No. 77A—Model 5

Mr. LUMBERMAN:

Has your Superintendent or Foreman suggested or insisted upon the need of a fast feed matcher in your mill?

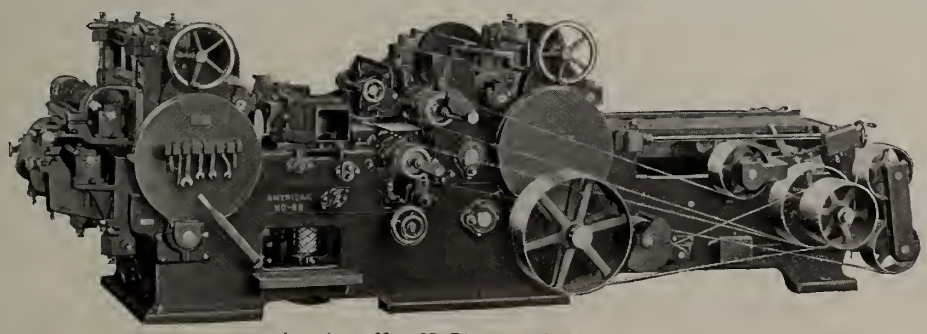
If so, have you investigated the qualities of "AMERICAN MACHINES."

We suggest that you write to any of the following—All users and SATISFIED:—

T. H. Hancock ... ...Toronto.	Adams River Lumber Co. ....Chase, B.C.
Wm. Copping ... ...Joliette, Que.	Giscome Lumber Co. ... .Giscome, B.C.
Ladder Lake Lumber Co. ....Ladder Lake.	Mundy Lumber Co. ... .Three Valley, B.C.
Prince Albert Lumber Co. ...Prince Albert, Sask.	Mickle Dyment ... ...Gravenhurst, Ont.
W. C. Edwards Lumber Co. ..Ottawa, Ont.	Mickle Dyment ... ...Toronto.
Finger Lumber Co. ... ...The Pas, Man.	Fassett Lumber Co. ... ...Fassett, Que.
Can. Puget Sound Lbr. Co. ..Victoria, B.C.	Jas. La Francois Co. ... .Quebec, Que.
Canadian Western Lumber Co.Fraser Mills, B.C.	

And then if you still have doubts, talk it over with our Mr. Garlock.

Its superior points will quickly convince you of the advantages of installing an "AMERICAN."

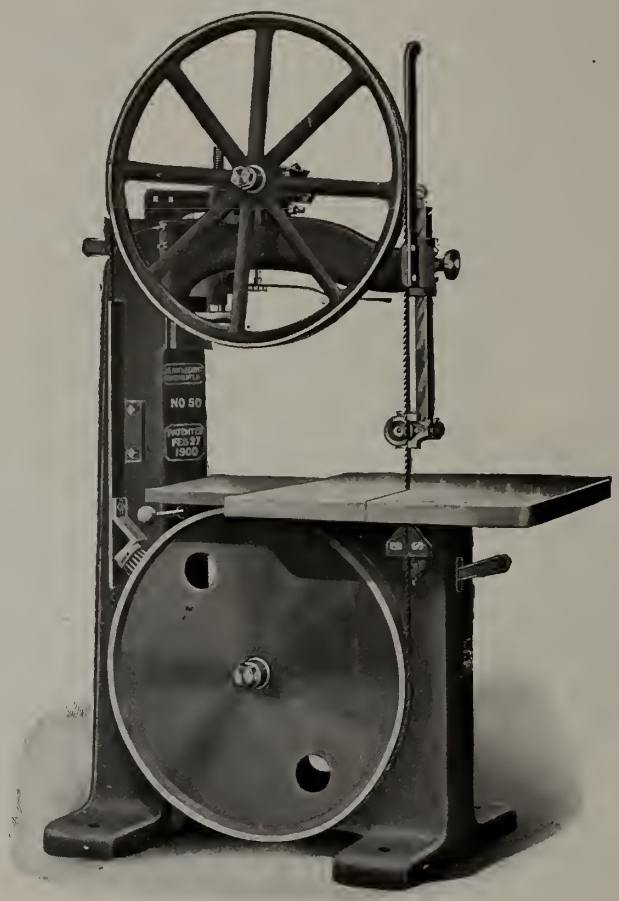


American No. 65 Planer and Matcher

Garlock-Walker Machinery Co., Limited

32-34 FRONT STREET WEST, TORONTO

TORONTO MONTREAL WINNIPEG



Save 25% to 50% of Blade Upkeep and Power Cost
Get Two, Even Three Times As Much Work

It's not the blades that wear out that cost, it's those that break.

It's the broken blades that cut down productive time and cost to repair and to replace.

Blade breakage is reduced to a minimum on Fay-Egan No. 50—36" **Square Column "Lightning Line" Band Scroll Saws.**

The Fay-Egan "Knife Edge" Blade Tension, made on the principle of a fine laboratory balance scale, is so sensitive that it compensates for changes in atmospheric conditions—yet, so flexible, you can pass a block between blade and wheel, while running, without breaking the blade. Folks tell us blade expense on "No. 50" averages 50 to 75 per cent. less than on the old timers.

The solid lower wheel acts like the fly wheel on your engine, its momentum carrying the load, so that the power consumption is reduced fully one-half, while at the same time it controls the light-spoked upper one, preventing over-running and choking down on a heavy cut.

The heavy square column eliminates vibration and permits the wheels to be revolved at 50 to 100 per cent higher speed, increasing the cutting capacity to double, and in some cases, triple that of the ordinary band saw.

As a user of saws, you cannot afford to ignore what Fay-Egan Square Column Band Saws are doing for others and can do for you. An investigation does not obligate you.

Always Cuts Smooth, Always Cuts Straight

Yates

"The Invariable Choice of the Man Who Knows"

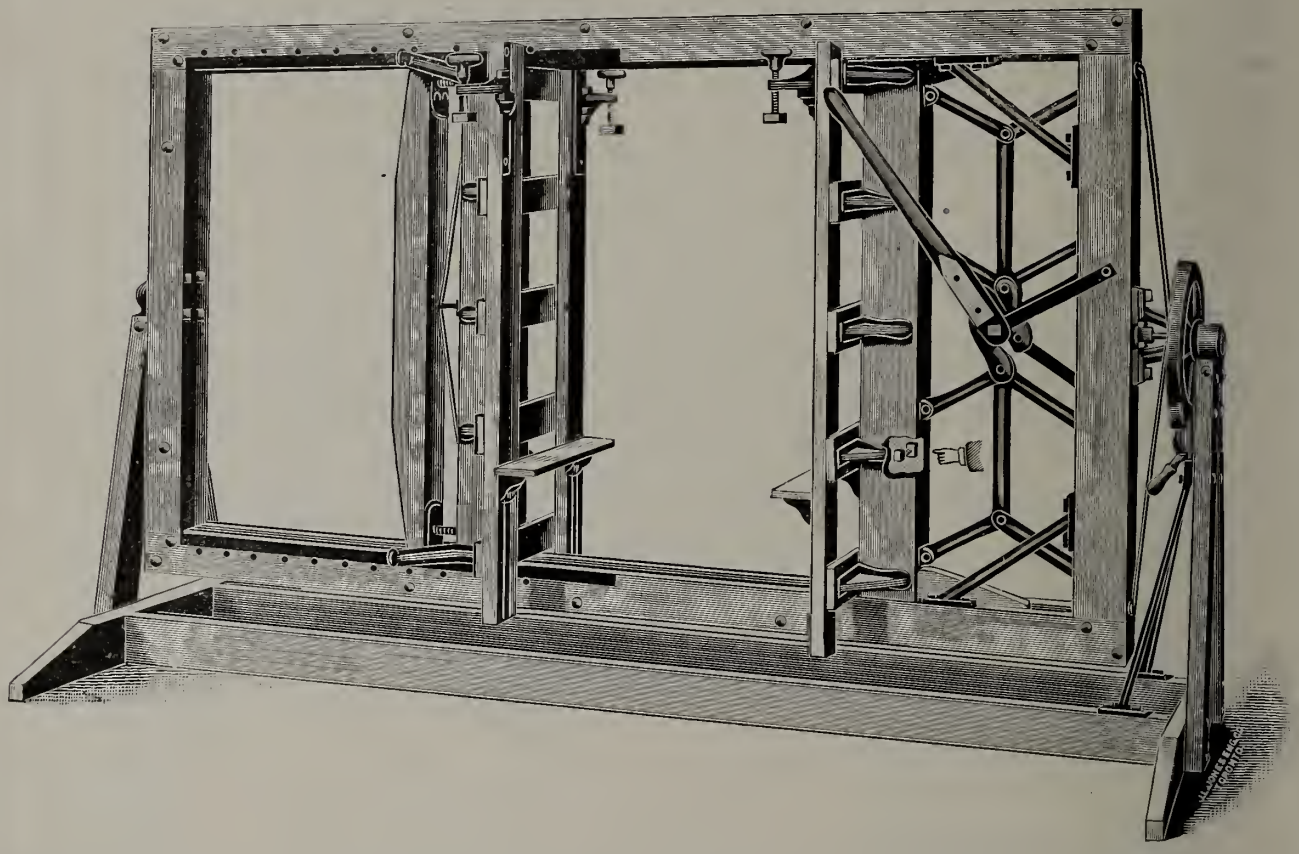
made in Canada

Yates type G-2 is the peer of all straight line edging and ripping saws, because durability and efficiency are combined to such a degree that it will do better work for a longer period of time, than any other machine of its class on the market.

Write for free illustrated circular.

P. B. Yates Machine Co. Ltd.
HAMILTON. ONT. CANADA
United States Plant, Beloit, Wisconsin

No. 190 Improved
Revolving Case Clamp
for dressers, bureaus, wash stands, phonographs, etc.



Will Give You Five Times The Output

This machine eliminates all unnecessary handling of the work. The clamp takes in a wide range of sizes as one end is moveable to any position, while the other end has sufficient movement to allow the case to be tightly clamped. This is done by means of the large lever shown at right of cut. A brake at the extreme right instantly stops the machine in any position.

The clamp requires but one man to operate. It will not spring, does not have to be released before revolving, and the workman can get at all parts of his case while standing in front of the machine. Made in two sizes, 50 inches high, by 5 feet wide; 72 inches high, by 5 feet wide.

Prices and further particulars await your request.

Jackson, Cochrane & Company
KITCHENER - CANADA

The "Shimer Limited" Expansion Head

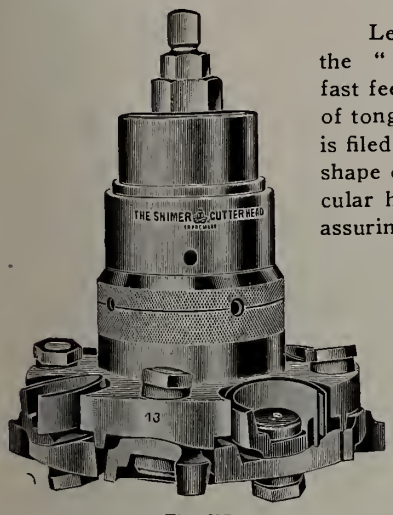


Fig. 627

Let us draw your attention to the advantages of using the "SHIMER CUTTER HEAD" for general Mill and fast feed Planer work. The Cutter is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The bit being circular has from 3½ in. to 5 in. cutting length to the cutter, assuring long wearing life to the cutters.

Note that the cutter, being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without the Self-Centering Sleeve, and made Expansion or Solid, to suit the customer's wishes.

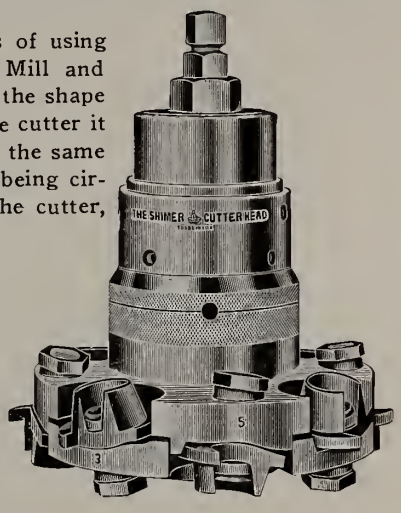

Fig. 268

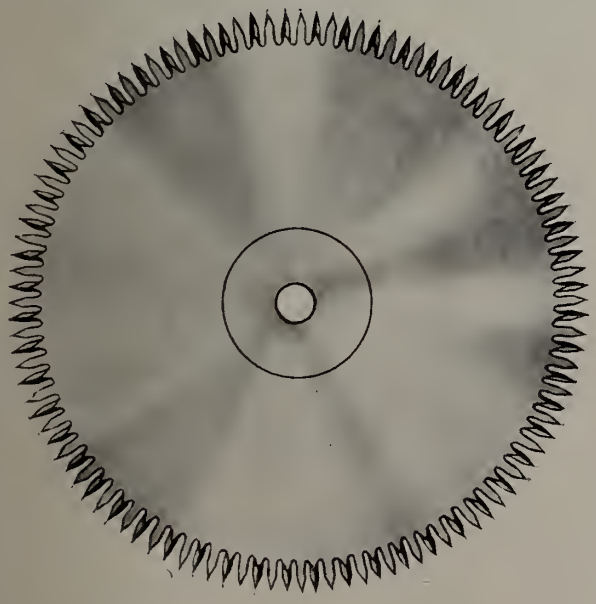
Shimer Heads have been in use for sixty years, and their reliability and reputation have spoken for them in the past. Let us know your wants and we will guarantee their reliability at the present.

SHIMER CUTTER HEAD CO. OF CANADA, LIMITED

Successors to Samuel J. Shimer & Sons, Inc.

GALT, ONTARIO

Have You Used Radcliff Circular Saws?



They are the perfect saw because only the best Jessop crucible process steel is used in their manufacture. They are tempered in modern oil furnace regulated by electrical pyrometer. They are finally finished by saw makers of many years experience.

A trial will convince you that our claim is founded on results

W. S. HAWKER.

Inventor and Designer of the World's most efficient Tubular Turning Machinery

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

W. S. HAWKER MFG. COMPANY

DAYTON, OHIO.

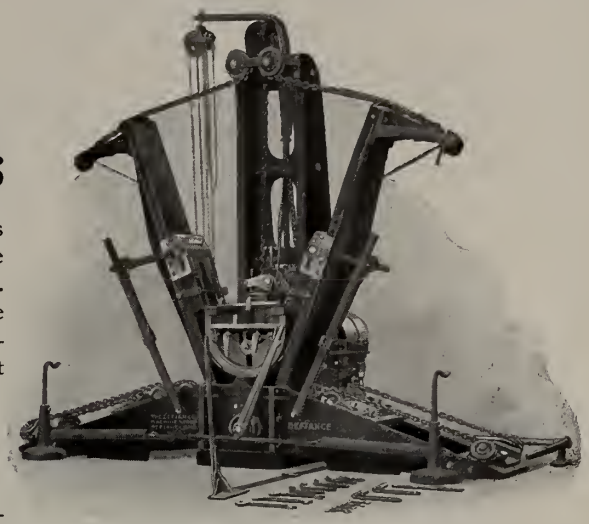
Why Struggle Along Continually With Obsolete

Wood Bending Methods

when a little time spent investigating Defiance bending machines would lead to the salvage of your present material wastage—increase your present output, and reduce losses in breakage to a minimum. Defiance bending machinery is serving wood benders everywhere throughout the world. Its success, so pronounced and so long continued, proves Defiance methods of wood bending the most correct in use today.

DEFIANCE HIGH PRODUCTIVE WOOD BENDING MACHINERY

is built in various designs and sizes, and particularly adapted to bending rims for artillery wheels, automobile, auto-truck, wagon and carriage wheels, table rims, plow and truck handles, hames, bows for vehicle tops, and steering wheel rims. For the complete manufacture of the foregoing products many of the largest manufacturers all over the world are using Defiance equipment—all of which is a proven success and high productive machinery.



12″ Patent Rim, Felloe and Round Bending Machine

Illustrated and descriptive matter on your requirements in wood bending machinery will be mailed on request.

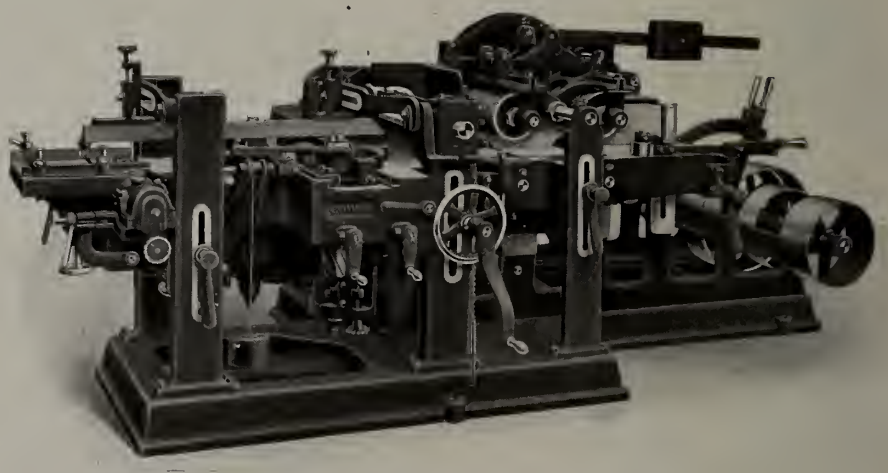
Full of Distinctive Features

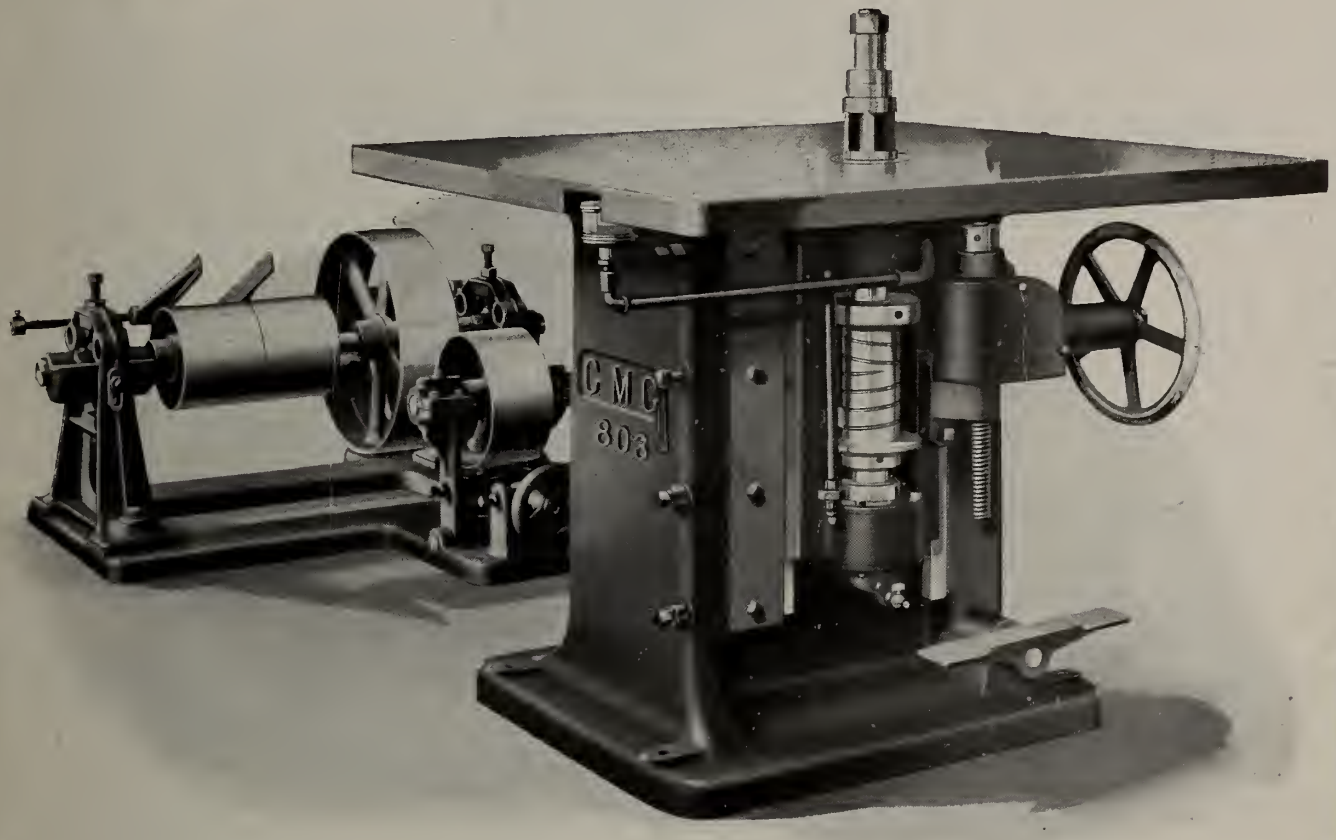


Cowan Woodworking Machinery is dependable, efficient and creates a great saving in operating costs. We manufacture

Planers	Mortisers	Band Saws	Sanders
Moulders	Borers	Scroll Saws	Grinders
Shapers	Lathes	Cross Cut Saws	Clamps
Tenoners	Resaws	Rip Saws	Veneer Presses

COWAN & CO. OF GALT LIMITED - Galt, Ontario

C.M.C. 803 SHAPER



Single Spindle **Ball Bearings** **High Speed**

DESIGNED as a strictly high speed shaper for the production of the highest grade of work, this machine embodies new and distinct features not found in other shapers upon the market. The fact that practically all work to be shaped in any ordinary manufacturing plant can be performed on a high speed spindle without reversing the cut or stock makes it unnecessary to supply two spindles on such a shaper. This necessarily enables us to effect a considerable saving in the first cost to our customers. With one spindle the shaper table need not be so large as on double spindle machines, which results in a saving of shop room. With only one spindle the operator can concentrate his attention to the work in hand and is much less liable to accident.

Special bulletin cheerfully furnished upon request

Toronto Office and Warerooms, Brock Avenue Subway

On Your Payroll

WHETHER poring over a blue print, figuring a cost sheet, or mounting a ladder to inspect line shafting, the S K F representative virtually goes on your payroll the minute he enters your plant.

So every S K F man justifies the basic S K F policy. He is a salesman only as he serves.

Not to hear bearings exploited, but to absorb the latest ideas on reducing friction—this is why the manufacturer sends for the S K F sales engineer.

And what more authentic advice is to be had than the engineering knowledge of anti-friction experts, supported by the impartial research of thorough, well-equipped laboratories?

Manufacturers are invited to avail themselves of this service.

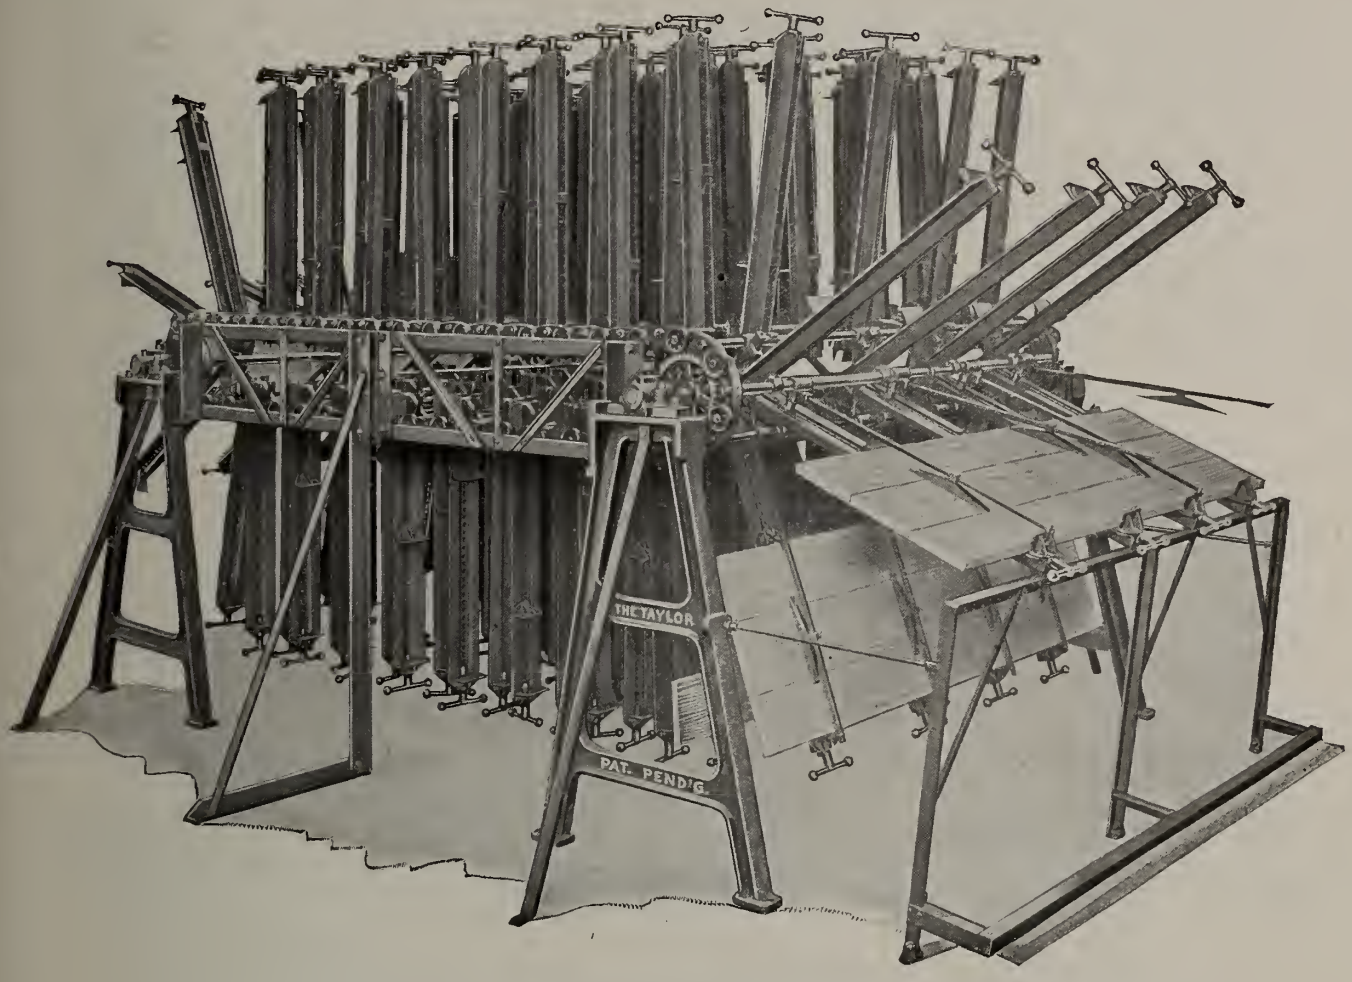
CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

GAYOSO LUMBER COMPANY

MEMPHIS, TENNESSEE

Reese Sheriff Lumber Co.

WILLIAMSPORT, PENNSYLVANIA

Manufacturers of

Northern and Southern Hardwoods White Pine, Spruce and Hemlock

With special attention to **Oak, Chestnut, Poplar, Cherry, Walnut, Gum and Basswood.**

OUR MOTTO

REASONABLE PRICES - that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

Are You Prepared "To Ride the Crest" of the Steadily Rising Tide of RED GUM *Popularity?*

Manufacturers of Desirable Grades of Furniture, those who have their fingers on the pulse of public taste, are rapidly *increasing* their lines of good

RED GUM

"Slow beginners" (known as the ultra-conservatives)—those who follow public taste at a safe distance behind—are *also* using a most unaccustomed quantity of **Red Gum.**

*This is the final proof that "**Red Gum** has COME."*

HOW IS YOUR LINE? ARE YOU "TO BAT" or on the bench, "waiting"?

The appropriate grades of **Red Gum**, "America's Finest Cabinet Wood," for good furniture (and trim), for every sort of use, are READY for PROMPT DELIVERY—and at prevailing prices are "the wisest buy for wise buyers" in the whole list of high-class furniture woods today.

Up-to-date architects and "interior landscape artists" are waking up and "giving their clients what they want"—i. e., **Red Gum**. (*ARE YOU?*) IT WILL PAY YOU TO *RIDE THE TIDE.*

WRITE US FOR ANY INFORMATION YOU WANT. WE'LL GIVE IT TO YOU RIGHT.

ADDRESS: RED GUM DIVISION,

AMERICAN HARDWOOD MANUFACTURERS' ASSOCIATION

STILL ANOTHER OAK FURNITURE ADV. APPEARING IN THE BEST MAGAZINES IN AMERICA.

OAK, as a CABINET WOOD, is serene in its conscious superiority.

Responsive alike to the best skill of the artisan and the artist, OAK combines all the qualities which contribute most to a home whose FURNITURE must (because of the little folks) at the same time impart ideas of beauty, dignity, poise and permanence—and good-naturedly repel the onslaughts of buoyant youth.

no finer heirloom than good OAK furniture."

...fe and enduring investment—none b...

I O W A
BLACK WALNUT

NO cabinet wood responds as fully to the art of the furniture designer or the skill of the workman as American Black walnut. It meets every requirement.

Furniture of Walnut possesses a lasting charm and beauty that age does not destroy and the liberal use of this wood in furniture factories, guarantees the quality of their product

Our customers assure us IOWA WALNUT is superior to all other varieties for its texture, grain and beautiful coloring. We can prove this by our first shipment

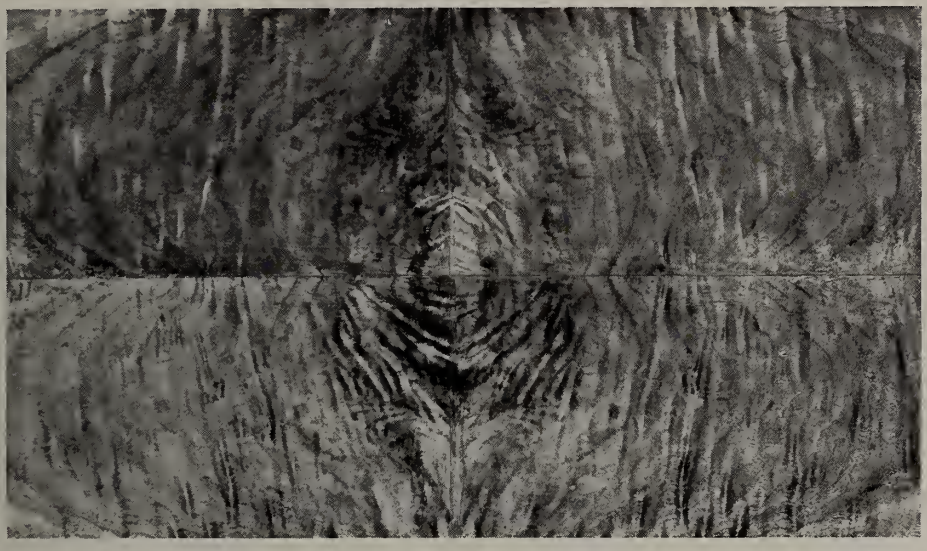
Send us your list of Walnut requirements in lumber and veneers

Des Moines Sawmill Co

DES MOINES, IOWA

"Hartzell" Lumber and Veneers "Hartzell"

American Walnut Exclusively



"Hartzell's Choice Walnut"

Furniture manufacturers will do well to note that we produce only American Walnut, and therefore can be classed as the logical source of supply in this wood, and our years of experience in handling American Walnut will prove valuable to you if you desire to take advantage of it.

By saying that our long experience will prove advantageous to you we mean that you should by all means take time to examine our line before purchasing, because the quality will be far superior to the average line and the price no greater.

We study your particular interests and produce veneer of the kind and quality that is best adapted to your work, and whatever class of figure you are using we can give you a complete uniform line of just the wood you want for your selection, and it will not be necessary for you to handle a great lot of all sorts of samples and then find only a few stocks suitable for your needs.

When you purchase our line you can rest assured that you can duplicate your purchase just as near as it is possible to do so in Veneers, that is our part in serving you and we see to it that you are served right.

"SEND YOUR INQUIRIES FOR VENEERS TO US."

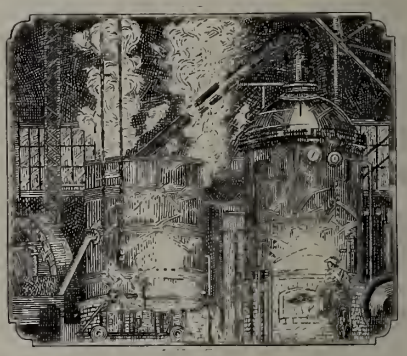
Wood Turpentine
(MADE IN CANADA)



THE Canadian Wood Turpentine—made at our mills at La Tuque, P.Q., is an excellent diluent and solvent and contains no free rosin.

This Turpentine is made by an improved laboratory process from Canadian woods and its distinctive odor clearly indicates that it is a different product from that given by the older methods of distillation.

Further and complete information gladly sent upon request.

Tennessee Aromatic Red Cedar

Is a wood of charm and romance that has met with much favor in the States and is being used in greater quantity each year to produce a very necessary household article—namely—the Aromatic Moth Proof Chest—for the storage of woolens, furs, etc. There is also an increasing amount being used for the manufacture of Ceiling and Flooring, for lining wardrobes, clothes closets, and so on.

Our company handles a very large quantity of this material each year; in fact, specializes on this particular wood. Our shipments for the year just ended amounted to approximately nine million feet.

We are in position to take care of your requirements for this wood in any quantity, and we have recently inaugurated a plan that enables us to ship from our Proctor, Arkansas, Hardwood mill, mixed cars of Hardwood and Cedar—where your requirements hardly justify the purchase of a full carload. All of our straight carload Cedar shipments are made direct from our Cedar mills located in the hills and mountains of the South.

We will be very glad to hear from you, giving you detailed description or any information that we can.

When asking for Cedar, do not hesitate to ask for quotations on Southern Hardwood Lumber. While our stocks are somewhat broken, we are still able to take care of a reasonable amount of new business.

HIGH LABOR COSTS

are giving you as much worry as they are giving us. We can show you how to ***reduce*** them by driving ***seven*** screws in the time formerly occupied in driving four.

Read below what one large furniture manufaeturer said about our screws to one of his competiors.

See That Square Hole? ↓

See That Square Hole? ↓

Robertson Patented Socket Head Wood Screws

We are in receipt of your letter of the 17th in reference to the Robertson serew. We were rather baekward in trying to make ourselves believe that this screw is as good as the old slot serew, but we have entirely ehanged and are now using the soeket head screw exelusively. It would surprise you how many more serews of this make the workman ean drive than of the old style. You will make no mistake in using their screws altogether.

WE MAKE AND SUPPLY FREE WITH FIRST ORDER BITS FOR USE IN REYNOLDS MACHINE OR ANY OTHER TYPE DRIVER.

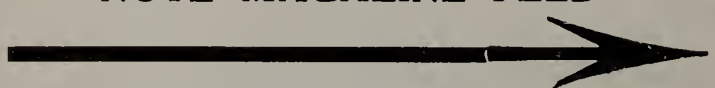
P. L. Robertson Mfg. Co., Ltd.

Milton - - - Ontario

Drive Your Screws Speedily and Accurately

Recent tests have proven the revolvingly driven serews to have holding power forty-nine per eent. stronger than serews driven by hammer. The hand method of serew driving is daily wasting time and profits that you may save by installing Reynolds Automatie Magazine Fed Screw Driving Maehines.

NOTE MAGAZINE FEED



Simply dump the serews into the magazine and the maehine does the rest. Ease of operation and simplieity of eonstruetion has made the Reynolds Automatie Magazine Fed Serew Driving Maehine simple to operate, your newest hand would operate these maehines with very little praetice. An average of from 1000 to 2000 ordinary screws can be driven in one hour by these machines, eaeh perfeetly driven and driven to hold.

Write us today for further particulars.

Simply dump a gross of screws (either wood or machine) into the hopper. The machine does the rest.

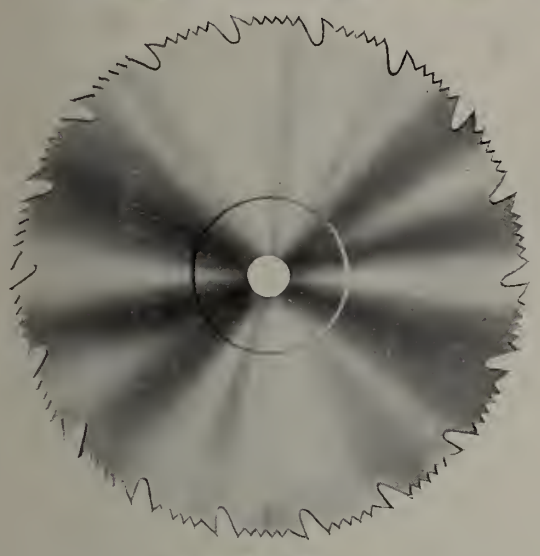
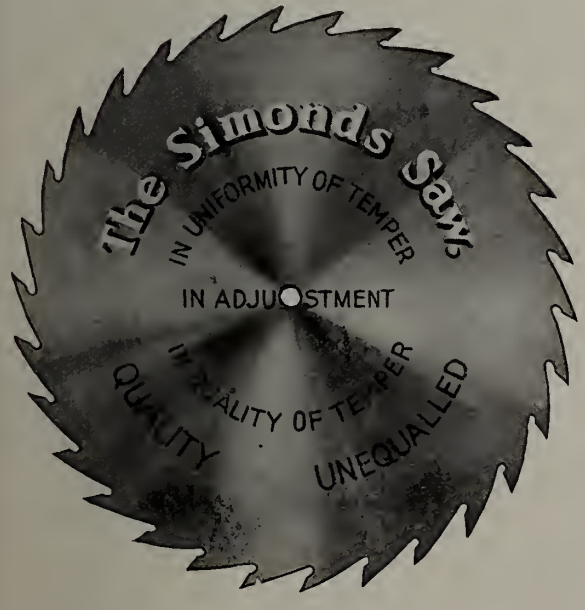
SIMONDS



SAWS AND KNIVES



A cutting service that helps cut the cost of cutting in the woodworking shop or mill is something which operators look for, especially in these times of high cost of material and operating expenses. There is no surer way of meeting the problem squarely than by selecting a line of Simonds Saw Steel Products, because they are a proven success, and in no way an experiment. If it is a Circular Saw, or Narrow Band Saw you need, first investigate the Simonds. Our Circular Mitre and Novelty Saws are the peerless saws you will want. They are taper-ground to the collar, to run without set, and provide ample clearance. These saws are especially designed for smooth, clean cutting on work such as cabinet and kindred production. When you require machine knives remember that you will find none to compare with Simonds. These knives are of the highest quality with a cutting edge of tough steel which retains its keenness and cuts smooth, finished lumber.

Write us today for catalog and prices.

Improved Glue Heater

No heat controllers or other safety guards are necessary with this heater, **because it cannot injure glue.** It's simple, substantially made of copper and costs less than any other.

Let us tell you more about it.

We make any size desired.

Cincinnati Glue Heater Company
Cincinnati, Ohio

CASCO
Waterproof Glue

STRENGTH

Admittedly greater than the **best hide glues,** infinitely stronger than the vegetable glues.

COST

FOR JOINTING. Very much less than the hide glues.

FOR VENEERING. A little more per pound than vegetable glue, but little, if any, more per GLUE LINE FOOT.

PRODUCE THE BEST VENEERED PRODUCT. It costs no more in the beginning and very much less in the end. Hundreds of the larger manufacturers are using CASCO after exhaustive tests in comparison with other adhesives.

MANUFACTURED BY

The Casein Manufacturing Co.
15 PARK ROW NEW YORK CITY

NOTE. Send for Casco Red Book. It contains much information on glue, veneer and panels.

TORONTO - - ONTARIO

CARBORUNDUM BRAND GARNET PRODUCTS

PROTECTED!

EVERY roll of Carborundum Brand Garnet Paper or Cloth comes to you protected against the damage possible through handling.

For instance, the ends of every roll are amply protected against jamming — against being torn or split. First they are wrapped in a thick, soft, heavy paper folded down so as to form a wadding.

Then another end piece is put on and between the two is packed excelsior.

Thus are the roll ends amply protected.

Then, too, the entire roll is wrapped in a moisture proof covering, securely tied, intelligently labeled.

The rolls are in perfect condition when they leave us. We want you to receive them just that way — that is why we are so particular.

Vol. 20 **Toronto, February, 1920** **No. 2**

Mirror Plate Situation is Serious One

Under present conditions the life of the average furniture manufacturer is not one of ease and of the many difficulties with which he is confronted that of securing an adequate supply of mirror plate is not the least. The lumber situation presents many problems of its own but lumber may be secured at a price while the mirror plate market is fast approaching a state where it will be extremely difficult if not impossible to secure an adequate supply of this material at any price.

For some time past conditions have been gradually getting more acute but it was anticipated, in some quarters, that when the Belgian glass ovens resumed production this shortage would be made good. However owing to conditions in Belgium production is only one-third of normal and it is unlikely that it will be increased to any appreciable extent in the near future. On the other hand there is a world wide demand for glass.

In addition to the glass required by the furniture trade, which is all small sizes, the show case manufacturers and the automobile industry are big factors in the market, particularly the latter. The auto manufacturers require immense quantities of small sizes for windshields and windows in closed cars, and are willing to pay almost any price to secure their requirements. In fact this demand from the motor car industry is probably the largest single contributing factor to the present shortage of stock.

In view of this unprecedented demand from this particular trade the dealers in glass and mirrors find that they can dispose of all the small sizes they can secure at prices equal to those being paid by the furniture men for the silvered article. There is also the added advantage that the motor trade does not demand as high a grade of glass as the furniture trade, as small imperfections will pass in the windshield of a motor car. On the other hand the glass men realize that present conditions will not exist indefinitely and being desirous of keeping their connection with and holding the good will of the furniture trade they are striving to the fullest extent of their ability to satisfy the demands of the furniture men.

This condition is general as evidenced by the fact that some American furniture makers are shipping case goods minus the mirrors. They are instructing the dealers that the glass will be forwarded as soon as obtainable and even suggesting that they dispose of the goods to the buying public without the plates and promise delivery of the mirrors at a later date.

While the Canadian trade has not been forced to this extreme as yet, the situation is serious and some steps must be taken, at once, to conserve the existing supply of mirrors. On many lines being manufactured the mirror could be dispensed with entirely without detracting from the beauty or value of the piece. In fact a good designer could probably eliminate the glass from certain articles and at the same time improve the appearance of the product. The suggestion was made in an article which appeared in the May issue of the "Canadian Woodworker" that the mirror in china cabinets and buffets be replaced by a flowered curtain or piece of brightly colored drapery. The illustrations accompanying this article showed two very attractive pieces of furniture without mirrors. In addition to doing away with the glass on buffets and china cabinets the mirror in chiffoniers should be dispensed with wherever possible. If this were done it would be a big factor in ameliorating present conditions.

True the stocks of glass in this country are not absolutely depleted but the greater part of available supply is in large sheets and as such has an enhanced value. To cut this down and silver it would increase the price of the finished mirror to a degree that would almost make it prohibitive. It could be done if the trade would stand for the increased cost.

Another item that might well be considered is the quality of the glass. It is practically impossible to secure the quality of mirror plate that was on the market a few years ago. Many of the pieces now being shipped out contain slight imperfections. Owing to present conditions and the fact that the automotive industry will take this glass at the same price the shippers will not replace or make allowances for such faults. Perhaps they cannot be blamed. At any rate the furniture manufacturer is so placed that he must make the best of a bad business and accept the plate sent him. He in turn should take the dealer into his confidence explaining the situation to him and convincing him that it is utterly impossible to secure as high a grade of glass as formerly. The suggestion might be carried further and the buying public educated to the fact that the day of perfect mirrors is past, temporarily at least.

Canadian Furniture Makers Meet

Furniture Manufacturers' Association Hold Enthusiastic Gathering in Toronto—Prospects for Present Year Considered Bright—Achievements of Committees Very Gratifying—Questionnaire to be Issued

The Furniture Manufacturers' Association held their annual meeting in Toronto on Thursday and Friday, February 6th and 7th. While a few of the members were absent through illness the attendance was a large and representative one. H. M. Snyder, Waterloo, Ont., the retiring chairman, gave an interesting address and reports and papers were presented dealing with various phases of the work and the good

W. J. Anderson, Stratford, Ont.,
Chairman of the Association for 1920

showing made by the Association. There has been an increase in the membership of the Association which brings the total to 87 members.

The retiring chairman in his address stated that the past year had witnessed the inauguration of a cost accounting department under the capable supervision of J. E. Ferguson, Woodstock, Ont. A number of the furniture manufacturers have now got the cost system in full swing and are able to take off monthly balances covering all the activities of their factories. Others are installing time-recording clocks and taking other steps, which will enable them to keep accurate costs. It is anticipated that 1920 will see the system in full swing in the majority of the furniture factories. This work is taxing the cost accounting department to the utmost. From the information at hand it is felt that it is only a question of time before the whole furniture industry in Canada will have a reliable cost accounting system based on true cost accounting principles.

Proportion of Profits Speculative

While the past year has been a prosperous one for the majority of the furniture makers, still it must be borne in mind that a large proportion of the profits obtained were speculative profits and the danger to be guarded against is that the same calculated profit under normal conditions would not be sufficient to show a working net profit. If the price of raw materials were to recede, not only would this profit be wiped out altogether but a loss would accrue. The point for the manufacturer to consider is what portion of the profits have been obtained through speculative buying. This is a matter which will require careful consideration when making calculations for future business. .

As far as can be foreseen, the furniture trade will be taxed to its utmost during the present year to supply the requirements of the retailer. Beyond that time it is not wise to prophesy although there are no signs of business dropping off or any likelihood of a slump occurring as there is a world-shortage of all commodities required by man.

Ordering in Excess of Requirements

The secretary in his remarks pointed out that some retailers might be placing orders in access of their requirements, working on the principal that they would not be likely to receive more than fifty per cent. of the amounts ordered. This creates a fictitious demand; a condition that must be guarded against,

F. W. Trebell, Stratford, Ont.
Chairman of Freight Committee

otherwise a serious state of affairs might arise which would be prejudicial to the trade as a whole. The furniture producers were advised to examine into the previous requirements of their customers and distribute this year's output in something like the same proportions, so as to give a fair distribution of their product.

Among other duties the tariff committee has been

H. S. Robertson, Stratford, Ont., Chairman of Credit Committee

Jas. E. Ferguson, Woodstock, Ont., Chairman, Labor Committee

J. H. Baetz, Kitchener, Ont., Vice-chairman and Chairman of Credit Committee

giving special attention to the exchange situation, in particular the question of stimulating the production of furniture supplies in Canada was discussed. It was felt that if Canadian manufacturers once realized the vast quantity of material such as casters, locks, furniture hardware, etc., which is used annually by the furniture industry they would take steps to install the necessary equipment and supply this market. With the object of compiling this data a questionnaire will shortly be issued to the furniture manufacturers asking them to furnish information and figures pertaining to the supplies used during the course of a year giving the quantities and grades of the various items. It is thought that when this information is tabulated and totalled the amounts involved will come as a complete surprise to local industries.

Studied Labor Situation

During the past year the furniture industry has not been confronted by any serious labor troubles or strikes. The credit for this desirable state of affairs is due to a large extent to the work of the labor committee of the association. These gentlemen made a study of labor conditions in the Canadian furniture industry and also kept a close watch on any new developments in the labor situation in the American field. Their efforts and helpful suggestions have been of real assistance to the members of the association and the industry as a whole.

Work of Credit Committee

The credit committee are doing a good work and their efforts have prevented the furniture producer from accumulating a large number of bad debts. In their work they have co-operated with numerous retailers and have given helpful advice and assistance which has been in all cases welcomed by the retailer.

The election of officers was held at this meeting the following gentlemen being elected: Chairman, W. J. Anderson, Stratford, Ont; vice-chairman and chairman of the tariff committee, J. H. Baetz, Kitchener, Ont.; chairman of the credit committee, H. S. Robertson, Stratford, Ont.; chairman of the freight committee, F. W. Trebell, Stratford, Ont., and chairman of the labor committee, James E. Ferguson, Woodstock, Ont. Secretary, Wm. Cawkell, Toronto, Ont.

The January Furniture Exhibitions

The furniture exhibitions, which were held recently at the different producing centres proved very successful. The large number of dealers who visited the various exhibits were a very representative body, having come from practically all sections of the Dominion. The majority of the furniture manufacturers made their usual showings, although a few found it impossible to gather sufficient furniture to make a display, so simply closed their show-rooms.

The exhibits themselves were, with few exceptions, confind to staple and regular lines. Some new designs were displayed but the furniture manufacturers, realizing that production is the great need of to-day, were content to show their regular stock. Some had even reduced their lines, showing a fewer number of designs, so that they could increase production and reduce manufacturing costs by concentrating their efforts on fewer items.

The visitors showed a marked tendency to buy, and many fair-sized orders were placed. In most instances it was a question of how large an order the manufacturer would accept rather than how much the retailer could be persuaded to buy. The demand was strongly for the better-grade lines. It would almost appear as if, under present conditions, the higher the quality, and necessarily the price, the greater the demand. It seems that the buying public from the humble laborer to the wealthy capitalist, are all clamoring for the same grade of furniture—the best.

There was a slight tendency on the part of some of the furniture men to over-buy. As was pointed out at the recent meeting of the manufacturers, this attitude must be guarded against. The manufacturer should divide his product pro rata, basing his figures on the amounts supplied his various customers during the last year or two.

Attractive Living Room Tables

The Simplifying and Standardizing of Existing Lines will Increase Production and Help Solve Some of the Problems Confronting Furniture Manufacturers

By James A. Anderson*

The present strong demand for furniture is unprecedented and was to a certain extent unexpected. The combined capacity of the various furniture factories are taxed to the fullest extent of their productive ability and yet are unable to keep up with the requirements of the trade. The cry is for more furniture and still more furniture.

While the buying public is clamoring for quality, owing to this shortage of available stock almost any grade of furniture finds a ready sale. The lines being most assiduously sought after are those consisting of the very best grades that it is possible to produce—pieces that would not have found such a ready sale a few years ago.

The simplifying and standardizing of existing lines will tend to increase production and will to a certain extent help relieve the present situation. Another point worth mentioning is to have the different parts of various pieces interchangeable as far as possible. In addition to increasing production this has a twofold advantage. It lessens the variety of work going through the plant, lessens the amount of manufactured parts that require to be carried in stock and the workmen being constantly at work at certain operations become more expert and produce a greater quantity of better manufactured stock.

Living room or library tables in adaptations of the Louis XV., Queen Anne and Cromwellian period designs.

The accompanying sketches show three different designs in library or living room tables. These have the proportions and lines of the high priced articles and yet can be produced to sell at moderate rates. These designs can be detailed for either the standard or the knock down type of table but in either case the construction is very simple and quantity production is possible.

The Louis XV design would likely be made in either walnut or mahogany, although gum might be employed and stained as required to imitate either wood. The carvings which are planted on are composition and may be had from almost any manufacturer of furniture carvings.

The other two designs are adaptations of the Queen Anne and the Cromwellian period designs and would look best in either walnut or quartered oak. Suitable carved mouldings may be secured from the Waddell Manufacturing Co., Grand Rapids, Mich. The finish would be a dull rub or in the case of the oak tables a waxed fume.

The French legs and the turned legs are readily made on the modern automatic turning lathe. The carvings on the foot of the Louis XV leg and the coves at the sides could be done by hand. However the coves could be worked to better advantage on a spindle carver or carving machine. If this were done it would be necessary to use a gauge for depth and another for the edge of the leg.

The demands of the trade both for quality and quantity are such that the furniture manufacturer cannot afford to overlook any item no matter how small, in the construction and design of the various pieces that go to make up his line.

*Consulting Designs, Grand Rapids.

Every millman, foreman, or anyone else holding an executive position should make it his business to be well posted on the latest developments of woodworking machinery.

Going one better in running risks while working woodworking machinery is acting like a fool, and generally ends in disaster.

Bungalow designed along Colonial lines.

An Attractive Colonial Bungalow

Desirable Arrangement of Rooms Secured—Ample Storage and Closet Room Provided—Adequate Lighting Not Overlooked

The cosy appearance and the many attractive features of the modern bungalow have made it the choice of numerous home builders. Since its introduction a few years ago, this type of dwelling has proved very popular and is today being erected in large numbers.

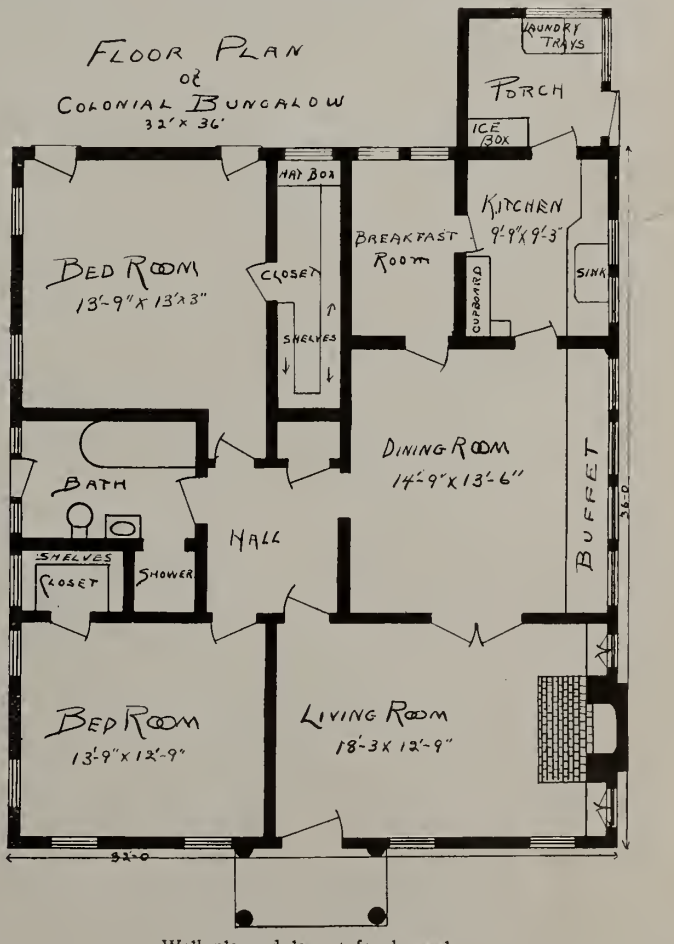
The term "Bungalow" is often used when referring to many distinctive types of homes, but, strictly speaking, should only be applied to a dwelling in which all the rooms are on the one floor. The accompanying sketch shows a very plain but attractive design of the true bungalow type. It is worked out along colonial lines, the wide eaves and the low shady porches of the California bungalow being replaced by the simple colonial porch with its gracefully tapered columns, the green shutters and other features that are associated with the colonial design.

The floor plan shows an unusually desirable arrangement of rooms and fixtures. The front door opens directly into the living room. When entering the attention is irresistively drawn to the cheery fireplace at the far end and at the same time the wide doorway leading into the dining-room gives a view of the built-in buffet, which fills one side of that room.

In this house the breakfast nook, which is being included in many residences, is replaced by a small breakfast room opening directly off the kitchen. This could be converted into a large roomy pantry if desired. The kitchen is provided with a large built-in cupboard and a wide shelf or table, with sink in the centre, along the outside wall. In the back porch is found laundry tubs, refrigerator and a fair amount of storage room.

Access to the bedrooms is gained through a small hall, thus doing away with having the sleeping quarters open directly into either the living room or dining room.

One feature worthy of mention is the large number of windows provided. If there is one item in the construction of a home that contributes more than any other to health and cheerfulness, it is an abundant supply of natural light in every room. Many of the present-day houses are not supplied with sufficient windows. The bright, cheery rooms would sell this bungalow to many a prospective purchaser.



Well planned layout for bungalow.

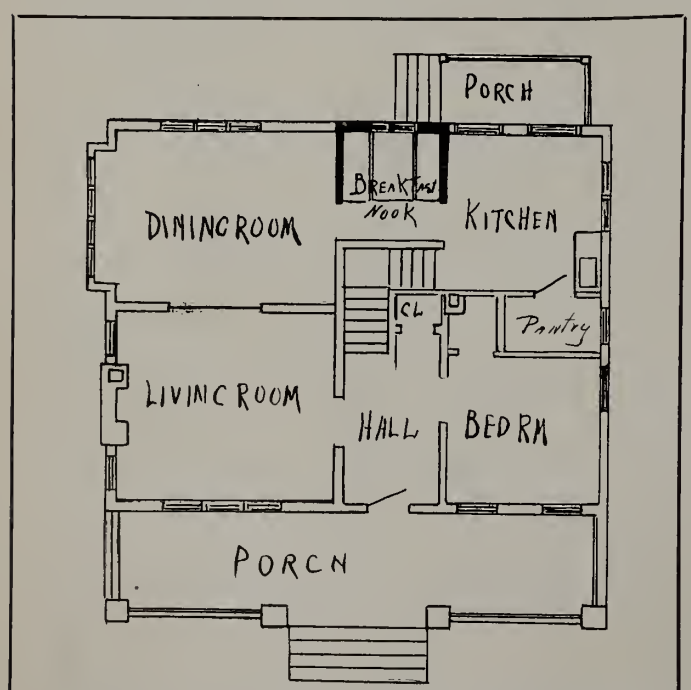
What is More Convenient Than an Alcove?

The Newer Type of Home Has Many Conveniences and Comforts—Breakfast Alcove, Den, Spacious Living Room are Practically Necessities—Seats and Tables Should be Simple in Design and Suggestive of Comfort

By W. H. Shaw

In the old days "A man's house was his castle." Do we realize that now the home of the average Canadian citizen includes luxuries unheard of even in the great houses of the old countries, until quite recently He has comforts which even the very wealthy could not compass, only a short time ago. Really, the good time to live, as far as material comforts are concerned, is here and now.

The home is the centre and the heart, around which the whole of life circulates. Give a man a little plot of ground and he has achieved independence. This is the foundation of Canadian institutions. That which fosters and encourages the individual home, helps to build up and strengthen the nation. Most people build but one home. When it is completed and they live in it for a few months, they begin to say,"If I were building again I would," and they enumerate the things which their building experience has taught them. It is always difficult to get experience at second hand; yet to a certain extent it is possible. It is not uncommon for the prospective home builder to find that his taste for all that is artistic and convenient



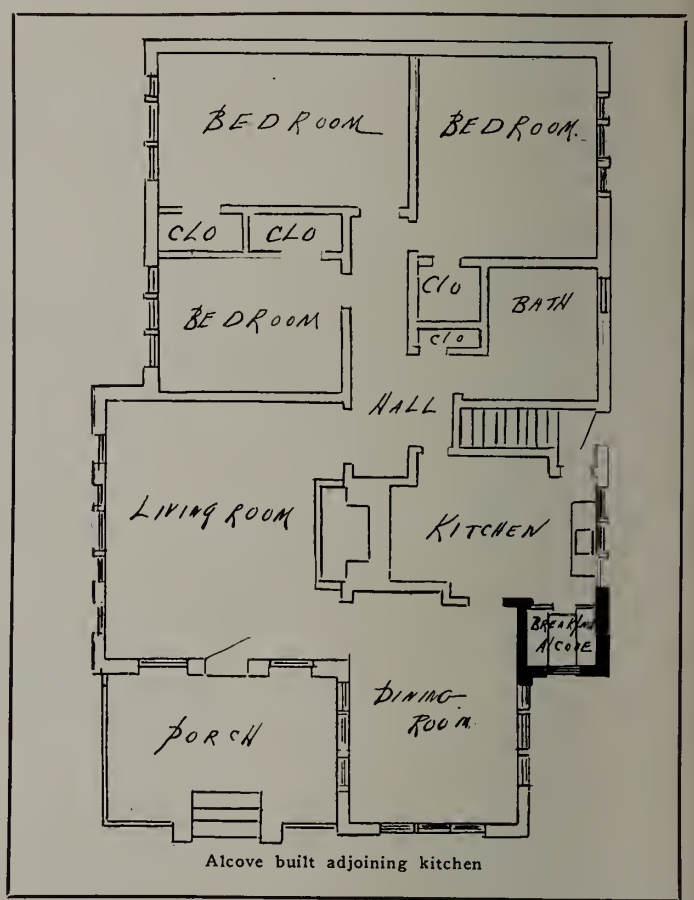
Layout showing alcove between kitchen and dining room

in a home far exceeds the limitations of his bank account.

The Bungalow has Changed

Originally the bungalow was a lightly-constructed, inexpensive building with but few of its present-day characteristics, which now comprise everything modern ingenuity can devise to make a home complete. Kipling, in the "Letters of Marque"—in which are jotted down the impressions of a young Englishman travelling for the first time in India,—coins the word bunga "loathesome" to express the hero's disgust of the usual one-story dwelling.

Long ago the American bungalow threw off the early traditions and limitations. This metamorphosis has been brought about by the great wave of popularity for the bungalow, which has swept over Southern California and other parts of the Pacific Coast, and



Alcove built adjoining kitchen

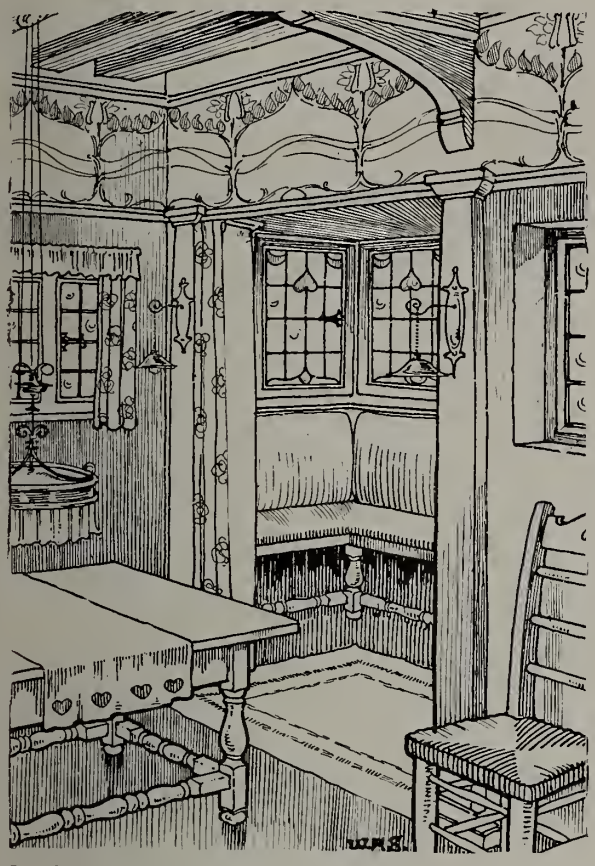
has now spread and is continuing to spread all over Canada, both in city, town, and country, until to-day, when the country throughout is sorely in need of homes, this is the popular class of building, both from the viewpoint of the builder, buyer and renter. As this popularity is no respecter of persons, it has captured the rich man as well as the poor, and the best of architects and designers have turned their attention to bungalows, and, naturally more attention has been given to the expensive than the inexpensive.

Attractive Features in Demand

So, as the man of moderate means begins to look around for ideas to incorporate in his new home, he is often attracted by that which proves too expensive. This is not because it is impossible to obtain artistic effects in the inexpensive bungalow, but because it requires so much artistic skill and vastly more labor to adjust all the real requirements to the price of the

inexpensive house. This skill is one of the costly elements.

The popularity of the bungalow has created a demand for homes which are smaller on the outside and at the same time larger on the inside, than the old-fashioned homes. This is only reasonable as many will remember the sprinting that used to be done in the rambling old kitchen when breakfast was late,



Showing the attractive appearance of alcove off dining room

and yet how no one room in the house was big enough to gather a group of guests.

Several women were defining their ideas of a bungalow not long ago. One of them expressed her ideas in the following manner:—"A spacious living room, a sleeping porch, a Dutch breakfast alcove, plenty of verandah space, a cosy den with built-in bookcases, seats, a fireplace for rainy days, and where housekeeping is possible when a maid is impossible."

Attractive Features of Alcove

These Dutch breakfast alcoves will delight those who have been seeking suggestions for such features. The breakfast alcove is fast becoming quite popular in this country, and well it may, for it possesses many agreeable points. It is equally adaptable to a small house or a large one, and, as it provides a cozy corner where the morning meal may be taken without disturbing the regular dining-room, it is especially appreciated by the housewife who does her own work. When arranged for in the original plan, it requires very little additional space, and the cost of adding it to the house already built, is very small. By the use of curtains it may be almost as satisfactorily shut off from the kitchen proper as if another room were built.

The corner utilized for an alcove of this kind should possess at least one window, to give it natural light as well as ventilation, especially if it is to be curtained off. It should also be provided with means for artificial lighting, if possible. The table and seats should correspond in line and finish with the remainder of the woodwork of the kitchen, and the table may be made either stationary or moveable. It is, perhaps, more satisfactory to make it moveable, as it can then be used for other purposes in the kitchen. The seats are designed with comfortable backs and each is long enough to accommodate comfortably two or three persons. An extra person may be served by placing a chair at the outer end of the table. The table should be the same length as the seats but may vary in width according to the space at one's disposal.

Plain and Simple in Design

These seats and tables should be built as simple and plain as possible. The human race loves simplicity. The complexities of dress and surroundings which are about us are not ours from choice. They are forced upon us. Could we have our way, we would build plain walls, plain windows, casings, etc., omit frescoed ceilings and moulded panels, but when such a thing has been suggested in the past, people held up their hands in horror. Then along came the bungalow and told us to go ahead. Simple construction is the only thing worth fighting for. It is the easiest to keep clean, and provides an interior far more conducive to rest than a fussy treatment creates. When we come to think of it, it is the simple, unconventional use of built-in seats, beams, brackets, etc., and the suggestion of cosiness and comfort that the general public likes about the bungalow.

A piece of wood sawn so smoothly that it only needs sanding, saves the time of a man and a machine.

New brooms sweep clean, but even an old one is better than none at all in a mill.

How One Firm Handles Stock

Installation of Overhead Carriers Prove Labor Saving Feature—Facilitate Movement of Work and Increase Production—Applicable to Any Plant

Formerly when labor was plentiful and comparatively cheap the handling of material in the process of manufacture did not receive the attention it deserved. Nothing was though of taking a couple of men away from their work to help push a truck load of stock from one machine to another. The present

Carrying finished stock away from moulder.

scarcity of labor. and its high cost, has forced the factory owner to use every means at hand to conserve it. In this effort for greater efficiency the moving of the work about the plant is not being overlooked.

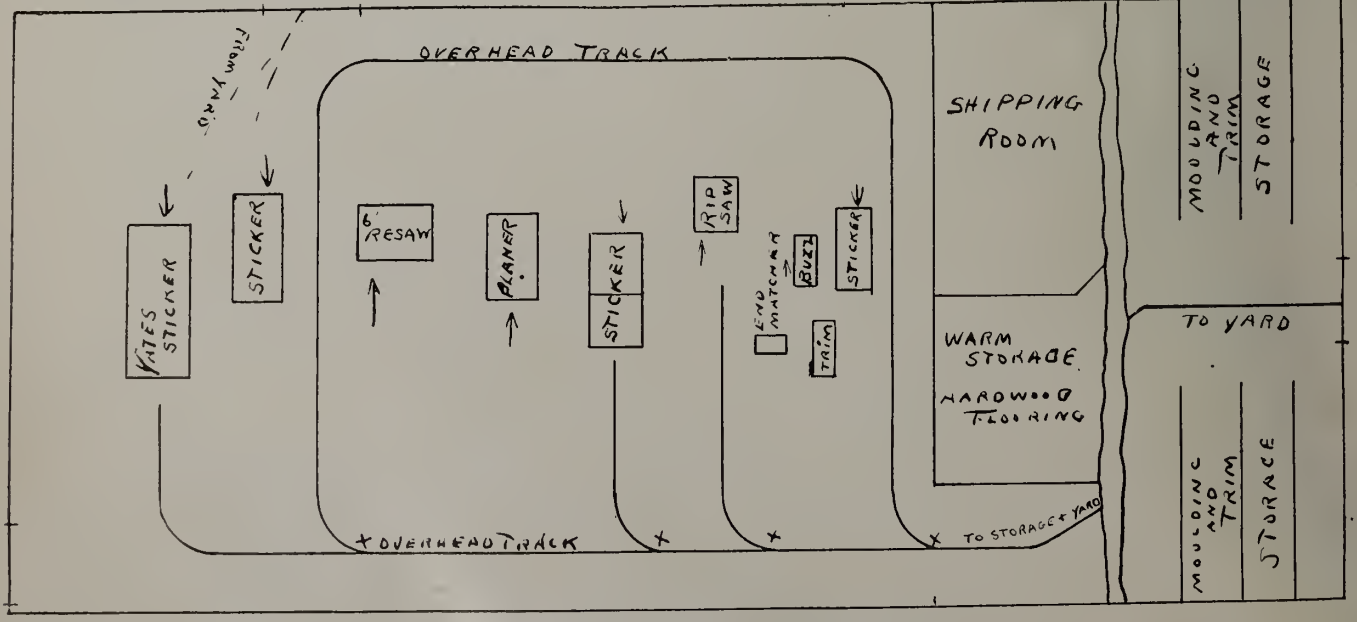
A firm who, in this respect, has kept abreast of the times is the Watt Milling & Feed Co., Limited, of Toronto, Ont. This concern recently installed an overhead carrier system to facilitate the handling of the material in their plant, and it has proven to be a labor saving, cost reducing feature.

Mr. Allan Watt, when asked his opinion, was very enthusiastic about the overhead system. He stated that they would not be without it for anything. It has replaced four men who were formerly employed behind the different machines and in moving stock about the plant, and where the stock used to be picked up and laid down a number of times before it was finished, it is now whisked from one operation to another with a minimum of labor and effort. Larger loads can be moved with fewer men and with greater ease and rapidity. Another feature is that a small pile of lumber, or another carrier load of material, on the floor does not prove a serious obstacle as the load is easily lifted clear of all obstructions.

The accompanying plan gives an idea of the system installed. The main overhead track forms a rectangle, enclosing most of the equipment. Where it goes between the second sticker and the band resaw it feeds both machines. The same at the far end, where it is used to carry stock to and from the last machine. This machine, a sticker, is used largely for thin oak. T & G flooring. The oak is resawed on the bandsaw, then picked up and carried to the sticker. After being matched it is raised and run out to the dry storage. The shorter lines, as indicated, take the finished material from two of the stickers and feed the ripsaw.

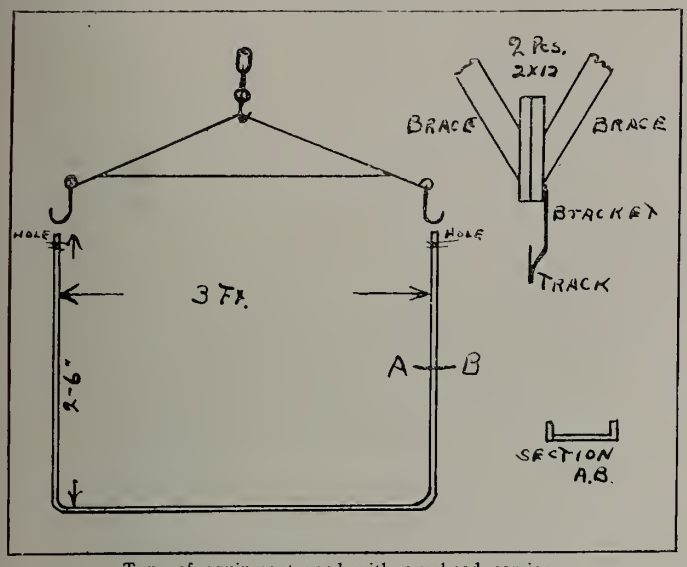
At each intersection marked X on the drawing a switch is provided, so that the trolleys may be run on the main track or switched off at will. At these points a small section of the curved track is hinged and is arranged so that it may be dropped down on top of the main line, thus making connection with the side line. It takes only a few seconds to make the change.

The second illustration gives an idea of the methods used to support the overhead track and the U beam used for carrying the stock. The former is self explanatory and need not be dwelt on in detail. As most of the material manufactured is in long length



Layout of overhead carrier in Watt milling plant.

the ordinary form of truck or truck frame is not suitable. Instead, steel in the form of a shallow U beam, has been taken and bent, as shown. Two holes were



Type of equipment used with overhead carrier.

drilled near the top for the hooks attached to the tackle. This tackle is shown in the drawing. Two of these bent U beams are taken and placed on the floor, separated to accommodate the length of material being handled, and the stock is piled in or drops in as it leaves the machine. When full it is picked up and placed where desired.

The carrier, which runs on a track, is a short trolley on two wheels with an efficient type of quick-acting chain block attached. Using the bent beams on long stock necessitates two trolleys and blocks being used, one for each end. It is a simple matter to run the blocks into position and attach the hooks, then a few pulls on the chains and the work is off the floor and away. If the passage is obstructed the load can be raised sufficiently to clear. A few edgings on the floor or even a small pile of lumber or other material does not interfere with the moving of the work as it would were trucks employed.

The overhead carrier system is capable of wide development and may be used in any woodworking and furniture factory. It can be installed on a small scale and gradually extended to touch every machine in the factory.

With such a system a good idea might be to have a central parking area where all loaded trucks could be placed until required for the next operation. This is possible, as a loaded truck from the centre of the parking area could be readily picked up and placed where desired. If this were done the space around the machines would be kept clear and production aided.

Cutting Costs on the Sticker

Running Simple Mouldings in Multiple Increases Production and Reduces Manufacturing Costs—Applicable to Many Designs

By D. L. W.

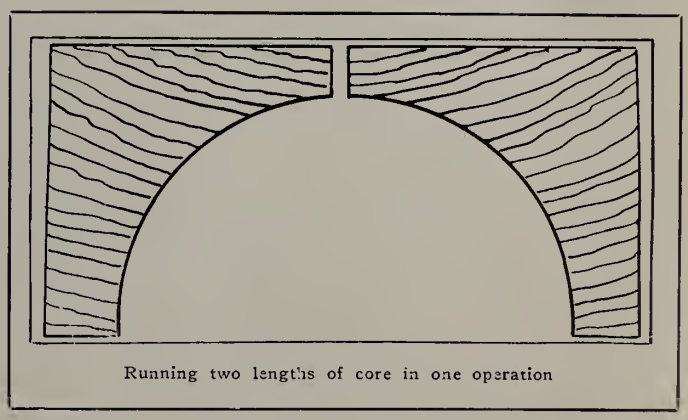
The subject of running mouldings in multiple was brought to my attention recently while strolling through a planing mill. One of the stickers, which was running cove, had been set to cut two lengths from one piece of stock.

The practice of running mouldings in multiples of two, three or more is one that is followed by many large operators and is one that can be profitably adopted by the small planing mill, in a more limited way. It offers a fay of producing mouldings at less cost than by the single piece and materially increases the output of the machine. In addition it saves the labor involved in ripping and preparing the single strips for the sticker.

Items to Consider

This method cannot be worked advantageously in every case so that before the runing of mouldings in multiple is attempted, there are a few points that must be considered. The first item is, perhaps, the quantity to be run. It would hardly be worth while to set up to run a few hundred feet in multiple. This method works to best advantage when there is a large amount to be put through. Then there is the question of stock. It might not pay to run a moulding in multiple from a wide and higher-priced grade of stock if there was a quantity of edgings and narrow stock on hand. If that were done it might be found that taking the value of the raw material into consideration, the moulding run in multiple from wide material might cost more than if it had been made from the cheaper lumber and run singly. There are many cases where this method can be followed and a considerable saving effected.

The cove referred to was 1¼ in. each way and was being run from 6/4 stock. The lumber was ripped to about 2¾ in. wide and run through the machine. The top head was set to surface the top side and two ripping or grooving knives were attached. these knives were set to cut sufficiently deep that when the cove was cut on the lower head, the piece fell in two. The side heads were set to dress the sides, the



Running two lengths of core in one operation

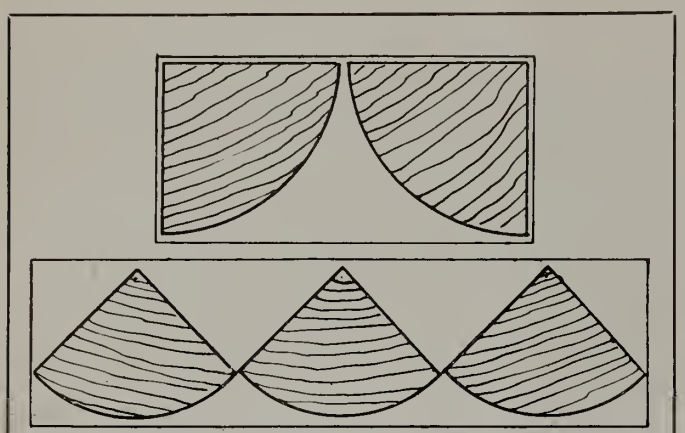
knives being set at an angle to give a slight undercut to the finished cove.

Bearing on Back Bed

The bottom head had a pair of flat and a pair of round knives, to cut the cove, attached. The widest

edge of the cove was run on the bottom. This gave sufficient bearing surface on the outside bed to prevent the pieces twisting and allowing the last end of the length to drop on the knives and be dubbed or chewed up. In some instances it will be found necessary to attach a block on the back bed to prevent this. The accompanying sketch shows clearly how this stock was run.

Quarter round is another item that can be worked out advantageously in multiple. I well remember when I started working in a factory, one of the first



Two methods of running quarter round in multiple

jobs given me was running quarter round. The stock was cut from edgings and waste material and was in various lengths from 4 ft. up. It was sawed to run singly. The way we did it was to place a form with a V in it, on the bed of the moulder and feed the stock in corner-ways, the cutting being done entirely with the top head. The material never feed readily as there was not enough bearing surface on the rolls, and if additional weight were added, they would cut deep and mark the faces of the round. It simply meant shoving this through by main strength, much to the detriment of hands and morals.

Excessive Breakage on Small Stock

The half-inch quarter round was the worst of all, as the stock was small and occasionally cross-grained. The result was that breakage was excessive both under the cutter and in front of the feed rolls, due to the strain of pushing the stock through.

There are a number of ways of running this item multiple and two are illustrated herewith. The sketch showing three pieces being made is a method that is extensively followed on the Pacific Coast. Instead of three they run as high as five and six. Lumber is plentiful out there and they do not attach much extra value to wide stock. In addition most of their machines are heavy and not adapted to small work. If three were run at a time the saving thus affected would be considerable.

Setting up For Quarter Round

A description of the method followed is hardly necessary. The V's are cut on the top head. The inside head is not used at all while the outside one is merely employed to size the material so that the back guage can be set nice and snug. The bottom head is used to finish off the rounds.

The other method illustrated is followed in many plants and effects a slight saving in material over the system described above. The top head is employed to surface the stock and both side heads are used. The knife on the bottom head is ground to a point and cuts through, dividing the piece in two. Here is an instance of where a block must be attached to the outside bed. If this is not done, as the last end passed through, the pieces would twist and drop on the knives with the result that a couple of inches would have to be trimmed off that end.

Two points that might be mentioned are that none but flat shoes are required, and if the stock should happen to be scant in places, it would not show on the face of the mouldings.

How to Accomplish Rapid Kiln Drying

Every wood using industry is interested in finding a quick method of seasoning wood, and expects that some day a new type of kiln will be devised which will accomplish more rapid drying. The U. S. Forest Products Laboratory has observed, however, that few kiln operators attain the fastest safe rate of drying possible with present-known equipment, and that **quick satisfactory drying depends more on the kiln operator than on the kiln itself.**

These are things that when they apply make for slow drying in any kiln:

1. Some one part of the kiln load is drying slowly because of sluggish and uneven circulation, and is holding up the entire kiln run.

2. The kiln operator does not know when the lumber reaches the desired moisture content, and therefore leaves it in the kiln longer than necessary.

3. The lumber may be casehardened and therefore unable to stand fast drying.

4. Lumber air seasoned six months is given exactly the same treatment as that air seasoned only four months.

5. The kiln operator does not know the moisture content of the lumber when it is put in the kiln, and therefore can not apply the initial drying conditions which are conductive to most rapid drying.

6. The drying schedule is regulated by the number of days the lumber has been in the kiln, rather than by the actual moisture content of the stock and its ability to withstand more severe drying conditions.

7. Steam is not supplied to the heating coils at night.

8. The kiln operator looks at his kiln only once a day, and then does not look at the lumber itself.

It is within the limit of commercial possibility for one-inch lumber to be perfectly kiln dried from 18 per cent. moisture content (reached, perhaps, in 3 months yard seasoning) to 5 per cent. moisture content, and conditioned for use, according to the following schedules:

Red gum	6- 8 days
Hard maple and birch	5- 7 days
Plain-sawed oak	8-10 days
Walnut and mahogany	6- 8 days

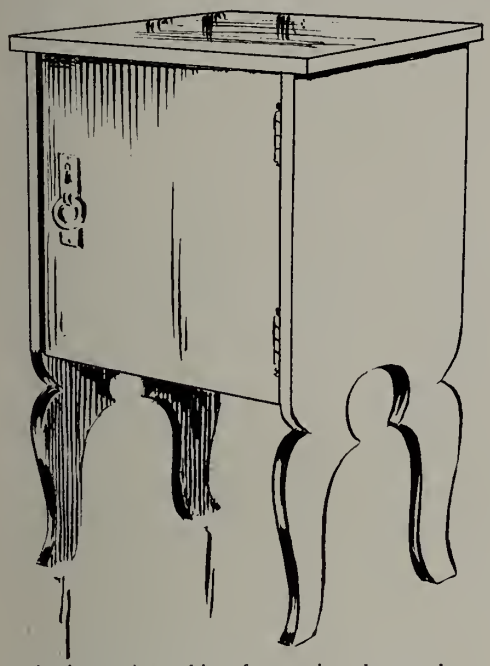
When you are tempering cutters use a film of oil on the top of the water. It will save the cutter from cracking.

Solving The Skilled Labor Problem

Evening Classes in Owen Sound, Ontario, Given Instruction in Drawing, Rod-Making and Stock Billing as Followed in Up-to-date Furniture Factories

By H. B. Beattie

The shortage of skilled workmen is a matter well worth the consideration of the furniture manufacturer. Many reasons have been advanced for this condition of affairs; insufficient wages, unsatisfactory hours, the general topsy-turviness in the scheme of things felt by so many men on their return to civil life, etc. All this may be, but I venture to say that a certain proportion of men who might be available



An interesting subject for evening class work

hesitate on the threshold of the furniture factory because they see no immediate prospect of getting in on the finer points of the game.

Men who do enter the factory with the view of becoming machine-hands, cabinet-makers, etc., and who have had little or no previous mechanical training, are soon alive to the fact that they have a lot to learn before they can expect to hold any position of responsibility, with its consequent raise in wages. A man may soon learn to operate an upright or horizontal boring machine, for instance, but when it comes to reading a rod or drawing he has to dash after the foreman for instructions and very often the foreman has to set up the machine for every job himself. The same thing applies to the cabinet-room. Many of the older cabinet-makers are unable to use a rod or drawing to advantage in spite of their long experience. The various pieces belonging to a job are, as a rule, trucked to the bench-room to be assembled and fitted, but the foreman is relied upon for the necessary instructions, not the rod or drawing, as the case may be.

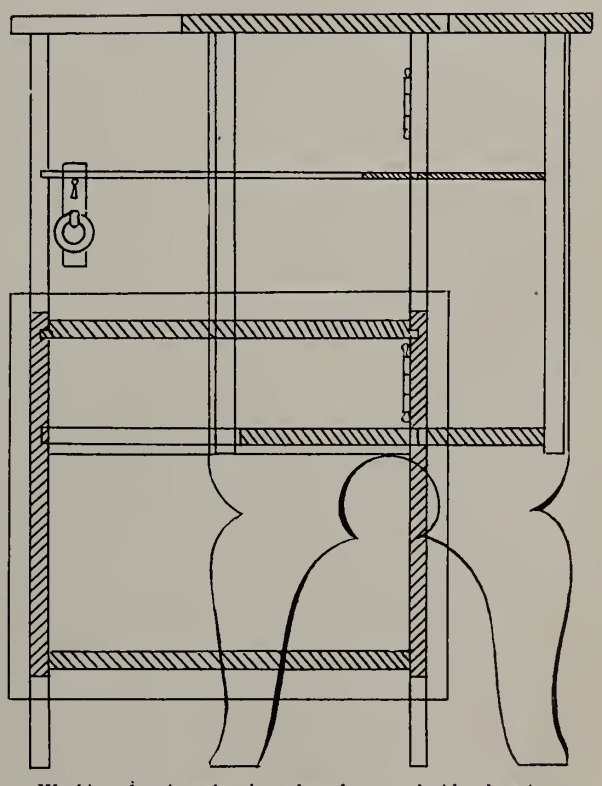
This would work out very nicely providing the various foremen had but one man to look after, but sach is not the case, and it is very much to the advantage of the man himself as well as to his employer, that he be able to readily understand rods, drawings and stock bills.

Now comes the Evening Industrial Classes where these men, as well as the older mechanics, are able to secure the little instruction necessary, not only in reading rods and drawings, but actually making these for themselves, following the methods used in our up-to-date factories. Stock-bills are made as well and the amount of material required is figured up.

Owen Sound is successfully conducting classes which are giving instruction in the iron and wood-working trades, with Mr. J. W. Dowkes as supervisor. An up-to-date class room in Victoria School has been provided. This is excellently lighted and is fitted up with regular drafting tables, with tops measuring 84 in. by 38 in., which permits the drawing of all the average pieces of furniture. The T squares, set-squares and all equipment is second to none in quality and from the point of utility.

The classes were opened last October, when a junior and senior class was formed. The junior class is composed of boys who had just started work in the factories, while the senior class comprised men who had worked at furniture making for some time.

At the start simple elevation and projection drawings, also lettering, were taken up and gradually small cupboards, shaving cabinets, etc., became the subjects. The students were asked to visualize these, or to simply make working drawings from given measurements and instructions while following the work set down on the blackboard.



Working drawing showing plan, front and side elevation

Some little difficulty was met with in the showing of sections, etc. Now the various pieces of small fur-

niture used as subjects, are taken in the white right from the factory to the school, where they can be taken apart to a certain extent and the various joints and other details of construction fully explained.

As the making of good rods depends largely upon one's ability to produce a good working drawing, these will not be attempted in class work till a little later on. The rod stock can be had from one of the local factories, given a couple of coats of shellac, sanded lightly and delivered to the school. The accompanying sketches illustrate the class of work being done at these Evening Industrial Classes.

Securing Uniform Tension in Band Saws

Saw Expert Gives Practical Suggestions on the Working of Resaw Blades

THAT uniformity of tension in band saws is very essential is apparent to all filers, and it is the universal aim of all to excel in that part of "saw doctoring."

I have seen some filers so painstaking in this effort, says a writer in "Yates Quality," that they would mark off four or five lengths and work just that spot, from mark to mark, until the tension gauge fitted that spot practically perfect, and then mark off another equal length and proceed again on the same lines. But if we stop to think a while, or if we examine a saw so treated, we will find that after all the saw is not uniform in tension. And, why not? For the reason that the saw blade bordering the mark on one side is in sympathy, so to speak, with the condition of the blade on the other side. Suppose you are tensioning a blade requiring 7 rolls to bring it normal, and you stop rolling right at the mark; then you are apt to find that about 6 inches on each side of the mark will still show tight. Now if you proceed to roll, or hammer, this apparently tight spot to conform to the rest of the marked space, you are very apt to find that on tensioning the next four foot space this 6 inch spot is too loose, and this looseness may affect the tightness on the other side of the mark to such an extent that it will be deceptive under a drop test.

I believe the better way, and one which I use constantly in my daily work, is to follow up each tight spot complete, whether it be four inches, or the length of the saw.

I place the saw first on top of the bench, place a block, or bridge, under it to test for tension, and if it shows a general run-down condition, such as the back getting too straight, I proceed to roll it a number of times, and in the spot mostly needed, all the way around the saw. Then I level for lumps and ridges, both crossways and lengthways of the blade. This finishes the job on the inside of the saw.

Now I put the saw beneath the bench, level down the most prominent lumps, etc., if there are any, and again put the block, or bridge, under the saw on top of the bench, test for tension, both drop and raised test, and follow out each tight spot its full length and width.

I believe that it is much safer to use only moderate pressure on the rolls and roll a greater number of times, especially when working a new saw, the temper of which may be softer than anticipated, or where different makes of saws are used. For I find that while each individual saw may be even in temper its entire length, not all saws, even of the same make, are alike, and as each saw maker uses a different formula for steel, the temper is of necessity varied in hardness and toughness. So it may be well to go easy at first until familiar with the pressure required for each saw. Another thing enters into this phase of the work, and that is the condition of the rolls. Of course, rolls that are not in line with each other, or the bench, or of different circle of convexity, will dish a saw. And there are saws so hard in temper that it requires a sharp roll to make an impression. But as a whole, rolls of medium crown will prove most satisfactory.

One predominating cause for saws leading in or out of the cut, or "bull nosing," as it is commonly called, is the teeth being sprung at the base. I believe the only place to straighten them is on the leveling block, as springing with the tooth gauge will not bend the tooth back at the exact spot, and it will act in sawing the same as driving a crooked nail into hard wood.

Even, uniform tension, level blade, both lengthways and crossways, a well-balanced swage with just enough clearance for the work required, and plenty dust room in the gullet, are the fundamental requirements for a good running saw. To this, add proper alignment of the mill, or feed rolls, and an accurate adjustment of guides.

The Safety Speed of Circular Saws

The National Safety Council recommends the speed of circular saws corresponding to rim velocity of 9425 feet per minute:

Diam. of Circular Saw.	R. P. M.
12 inch	3,000
14 inch	2,570
16 inch	2,245
18 inch	2,000
20 inch	1,800
22 inch	1,635
24 inch	1,500
26 inch	1,385
28 inch	1,285
30 inch	1,200
32 inch	1,120
34 inch	1,055
36 inch	1,000
60 inch	600
72 inch	500

Some manufacturers recommend somewhat higher speeds than here given; however, more than a 20 per cent. increase is inadvisable.

Band saws are operated at speeds of from 3,500 to 8,000 feet per minute, the heavier saws running at the higher speeds.

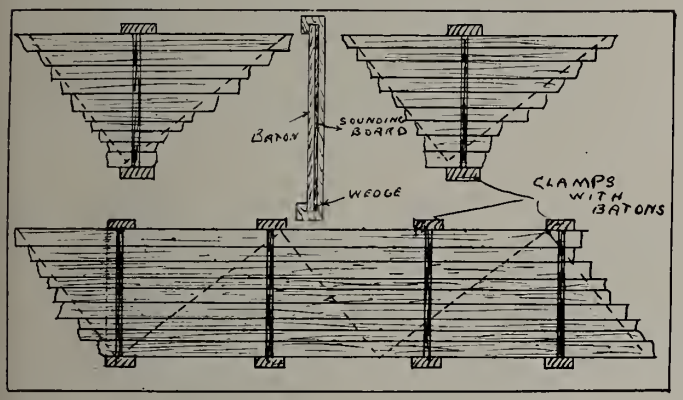
Chips alone do not make a good fire. Add about 50 per cent. of sawdust and you will then have no difficulty in keeping a good head of steam.

An Opportunity for Canadian Enterprise

The Manufacture of Sounding Boards for Pianos Offers Scope for New Business —Large Number Used Annually —Attitude of Piano Men Favorable to Establishment of Local Industry

By H. A. Ralphe

There are many fields of endeavor open to the progressive woodworker who will but keep his eyes open. Some of these opportunities, for such they are, might require a considerable amount of working up, while others might, for the want of a better term, be called ready-made. One of the latter



How boards may be glued in single or multiple sections

kind was brought to the attention of the writer a short while ago. It is the manufacture of sounding boards for the Canadian piano industry.

In Canada there are a number of thriving piano factories the combined output of which is roundly 25,000 cases annually. As a sounding board is required for every piano produced that means that there are in the neighborhood of 25,000 sounding boards used in Canada each year. Value these at $4.00 each, a very reasonable figure, and it means an annual turnover of $100,000 for the firm producing them.

Not being Manufactured in Canada

These boards have not, as far as can be learned, been made in Canada, so that the piano men have been forced to look to the U. S. factories for their requirements, The attitude of the piano manufacturers is favorable for the establishment of a Canadian sounding board industry. They have more than once expressed a preference for a Canadian made board, stating that they would gladly purchase their requirements from a local producer provided they could secure a satisfactory article. This subject was discussed by a number of piano makers who met recently and the consensus of opinion was that a good business awaits the firm that will produce a first-class, made in Canada, article. So much for the ready-made opportunity.

Perhaps a brief description of a sounding board and a discussion of the various methods of making it would not be amiss. The following sizes are not exact, in fact the specifications differ for the various makes and sizes of pianos, but the boards would average about 48 in. x 60 in. x 3/8 in. The material required is clear, white, edge grain spruce, thoroughly dried and seasoned. The finished boards are graded for color and quality of the wood, the clear white bringing the highest prices. Streaked and off color pieces condemn the board to a lower grade.

The material is worked up in strips varying in width from 1½ in. to 6 in.—wider would have a tendency to warp—with an average width of from 3 in. to 4 in. The strips are glued so that the grain will run diagonally to the finished board. In sanding the boards are made about 1/16 in. thinner on one edge than on the other.

The Necessary Machinery

The equipment required would depend largely on the methods employed in their manufacture. By purchasing the stock a full half inch think a resaw would not be required. If that were not practical a resaw would be needed and the stock cut from 5/4 or heavier material. The balance of the equipment should include a straight edging and jointing saw, swing cut-off saw, automatic jointing machine, planer, three-drum sander, suitable clamps and a large saw, preferably double cut-off for sizing and trimming the glued up pieces.

If the complete board were glued up, full size, in one operation it would require a 54 in. or 60 in.

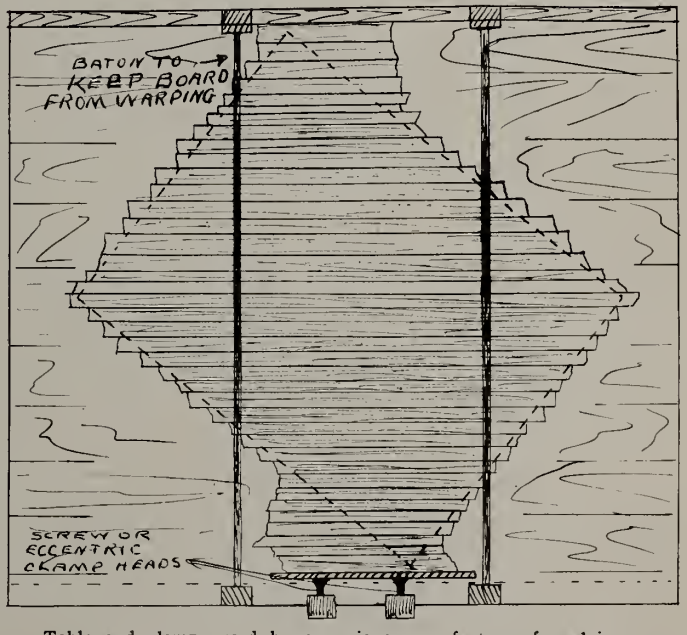


Table and clamps used by one piano manufacturer for gluing up sounding boards

planer to dress it. The work could probably be handled to better advantage by gluing up half sections, planing them and running them through the sander after the centre joint had been made. By scraping the glue off clean the sander could clean off the centre joint and finish the board in one operation.

The method of glueing and the most suitable form of clamp to use is a problem that would have to be worked out. By doing the work in half sections some form of revolving clamp such as manufactured by the Jackson-Cochrane Co., Kitchener, Ont., or the James

L. Taylor Mfg. Co., Poughkeepsie, N. Y. (A. R. Williams Machinery Co., Toronto, Canadian representatives), would probably be found to answer admirably. Individual retaining clamps might be made, somesomething similar to the one suggested in the drawing, that would prove convenient.

Glued Up in Half Sections

The gluing of the whole piece in one operation does not appear to be the best method. As intimated the surfacing of such a large piece requires a large expensive planer. The better way would be to glue up half sections either as individual pieces or in suitable lengths as indicated in the accompanying sketch. If the pieces were glued individually all the short pieces could be worked to advantage. A certain amount of waste would be eliminated by jointing the longer pieces provided the stock could be purchased in the necessary length.

The half sections could be dressed on the planer —a 40 in. machine would be ample—and the centre joint made before sanding. In the case of the long lengths the half sections would be cut up before the centre joint was glued. Practically all the boards have a slight taper, running from 3/8 in. or 5/16 in. on one edge to 1/4 in. on the other. This could be put on by dropping the sander drums a trifle lower on one side than on the other. Few if any of the piano manufacturers buy an accurately sized board so the sanding would be the final operation. They would then be ready for boxing and shipping.

Spruce is the only wood employed. Experiments have been made with other varieties but none of them seem to have the same sound producing qualities that spruce possesses.

The supplying of sounding boards to a growing industry like the piano industry, should be a very attractive proposition, as the business should grow from year to year. In addition there are other items such as sounding board ribs that might be supplied. The market is here, the raw material is here and a nice business awaits the man who grasps this opportunity.

Can You Adopt These Suggestions?

Room for Improvement in Methods Employed by Many Turners—Condition of Centres and Centering is Big Factor—Working for Results

By Observer

Every close observer of wood turners, their methods and habits, sees many different ways of arriving at the same results; and some of the methods employed seem so far from profitable that the beholder can only wonder why they are tolerated, much less constantly employed. The piece turners are usually pretty wide awake regarding centers and centering, though some of them are not so; but the time-workers seem to have a cinch upon slow methods and poor centers!

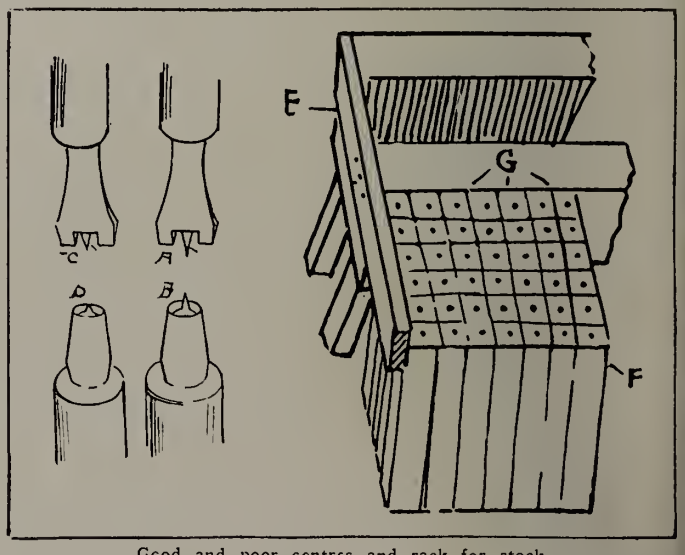
It was with pleasure that the writer recently watched a lively, brainy piece-worker after he (the writer) just passed through a "time shop" where no man seems ever to compare the amount accomplished with the time of day! In the piece work shop, a turner had a pair of centers—both live and dead—which had been sharpened to briarlike points, something as shown by Fig. 1, at A and B.

Work Quickly Centered

Close to the lathe of this turner, stood two trucks, one bearing blanks, the other holding finished turnings. This man never stopped his lathe all the time the writer was looking at him. The pieces on the truck of blanks were not centered and neither end of any blank bore traces of oil. The turner removed a finished piece from the lathe, laid it upon the truck and with the same movement, he picked up from the other truck a blank which was placed between centers and had most of the corners roughed off before the writer had half a chance to see how it was done so quickly.

Next time, the writer was looking! The turner steadied his left hand against the tool rest and placed the blank against the live center and as nearly in the middle of the blank as the turner's eye could determine. Then the same operation was repeated at the tail center end of the blank, which was whirled around by hand as soon as it had been caught between the very sharp centers A and B.

The tail spindle was screwed in far enough to hold the blank between the two sharp centers, then the blank was spun by hand and the turner noted the corner which was out of true and deftly slipped the blank slightly between the centers so that it would run more true. The change was made so quickly that one had to look twice to see it once. Probably two seconds of time were consumed in changing the blank between centers. Then the tail spindle screw was



Good and poor centres and rack for stock

given a turn, the dogs forced to bite the wood, and the roughing cut was half made before the onlooker had decided that the blank had been truly centered.

Condition of Centers Important

This turner did no centering of the blanks, therefore he spent no time in marking them or in handling

over the stock one or more times during the marking operations. But to do things in this speedy manner the turner had to look out for several things and to spend a little time in keeeping things just right. The head and tail center points had at all times to be kept in perfect condition.

It is not enough to occasionally sharpen the points of the centers or dog. The body of the center must be kept worked back or the point will speedily grow shorter and eventually take the shape and conditions shown by Fig. 1 at C and D, and the writer will defy any turner, no matter how good he may be, to center with these dogs in the manner described above for use with centers A and B. It is a whole lot of work to tool back the end of a cup center so as to keep its point projecting just far enough, and some turners have abandoned the sharp point business because of this fact. But some turners have solved the problem by drilling and tapping a hole in place of the center. Then a long steel pin, threaded to fit, is screwed into the hole and the end of the pin dressed to a point.

With this arrangement, whenever the point has worn back so far that it is not easy to spin a blank thereupon without touching the driving dogs or the ring of the cup, the pins are removed and a small steel ball (steel shot) dropped into the hole and the pin again screwed home. The shot will cause the point to protrude a bit farther, enough to be sharpened several times until worn down again, when the shot business is repeated.

Decreased Output Results

When the points of a center get into the condition shown at C and D, there is little use in having any points at all and it surely takes a lot of time to center work upon such centers and dogs. Certainly, no turner who respects himself or his employer will ever be found using such centers! There is another thing which should be closely looked after and prevented, and that is the breaking off or wearing off of driving dog corners. Usually such corners are found badly rounded, and throwing dogs into a box is usually responsible for most of this wear. A dog with clean, sharp corners will hold and drive nearly twice as well as those with corners missing.

When it comes to centering, there are so many methods employed by different turners that it seems too bad that centering turning blanks cannot be simplified and standardized. See what the Car Builders' Association accomplished in standardizing railroad car construction all over the United States? To be sure, centering turning stock is not as weighty a subject as standardizing passenger and freight cars, but it is important enough that a lot of money can be saved thereby for turning shops and for turners.

Methods that Might Be Improved

Just look at the various and time-killing methods employed in centering turning blanks. The example given above, eliminates centering entirely, root and branch. In contrast with this method, is that of the man who centers with a pair of dividers. He will place a blank flat upon a board or bench, open the dividers approximately one-half the thickness of the blank and with one leg of the dividers resting upon the board, he will describe a line across the end of each blank. Then the blank is revolved a quarter of a turn and another line is described and so on, until four lines have been described on each end of each and every blank!

Time? To be sure this method takes time—plenty of it—but that does not worry the time-working turner any. But I have never seen a piece worker use this method of centering.

Another time-killing centering device is the trough with a knife-edge fixed vertically and rigidly across one end, from the corner out and true with the two trough sides. A blank is placed in this trough which is stood almost on end but inclined at such a slight angle that a blank placed in the trough will fall into the corner thereof. Then, the blank is struck on its end with a hammer and driven against the knife-edge which makes a mark across the lower end of the blank.

The blank is then revolved a quarter turn and struck another hammer-blow which marks the center at the intersection of two diagonal lines from the corners of the blank, which is then turned "end-for-end," and the operation repeated, two more marks being made upon that end of the blank also. Both the above described methods are bad enough and both are time-killers! If it be considered that the shop cannot get along without centering turning blanks, then by all means procure a centering machine which will do the work automatically, once the blanks are fed into it. I have seen such a machine advertised "somewhere—sometime" but do not recollect where or when. But, if you can't buy such a machine, then make one of your own—it's not so much of a task!

Have Stock Convenient

One way of getting rid of centers, also of working with a single truck for stock, instead of having two trucks underfoot and in the way, is shown by Fig. 2. When a truck of blanks was received—this man was turning legs for kitchen tables from whitewood at a cent and a quarter per leg, and making about $4.50 per day—the blanks were stood on end against the lathe bed and a piece of board E, which was nailed to the ends of the lathe timbers, the latter projecting a couple of feet past the lathe head stock in this instance.

The blanks were all stood on end, as shown at F, leaned a very little in two directions so as not to fall down too easily. Then a drop of oil from a squirt can was placed upon the end of each blank, as near the center as possible, as shown at G. This was all the centering the blanks received from this turner, who used the sharp points on dog and tail, but who used a trifle different method of centering the blank upon each point.

This man would place a blank against the dog point, holding the blank there with his right hand. Then he would give the blank a quarter turn movement back and forward, watching to see that the center was as near the middle as the eye could determine. Then the turner would revolve the blank a quarter turn, holding it against the dog all the time, then he would shift hands, place his left close to the tail-center end of the blank and hold it against the dog with that hand. Then, the centering and to and fro movements would be repeated at the tail-center end of the blank, and, when the center was screwed in, the turner knew the blank was accurately centered. The several movements were all made in less than four seconds—less time than it would require to center-mark the blank. And it does seem that the best way to center is not to center at all.—"Wood Turning."

Convertible Tables for Small Homes

Ingenious Construction of Living or Dining Room Table With Disappearing Leaves

The "Libry-dine" is the name of a line of tables, with disappearing leaves, the Canadian rights of which are held by the Kilgour Davenport Co., Limited, Toronto. These tables were recently added to the davenports and divanettes that this firm has been

Libry-dine in period design

turning out for a number of years, the whole making a line of high grade living room and apartment furniture.

At the present moment apartment furniture is in very great demand and Mr. Kilgour stated that they were simply swamped with orders. They found it utterly impossible to keep up with the amount of business offering. In the face of this the demand for the Libry-dines is rapidly increasing.

This table was designed specially to meet the requirements of the small apartments but will be found convenient in any home. It can be converted from a living or dining room table to a dining table or vice versa in a very few seconds. When used as a library table there is nothing to indicate that it is other than a regular solid library table, the leaves being entirely invisable.

The construction is very clever. The top is attached to a pair of iron brackets which are raised and lowered by a slight movement of a lever. When

Showing table with leaves extended

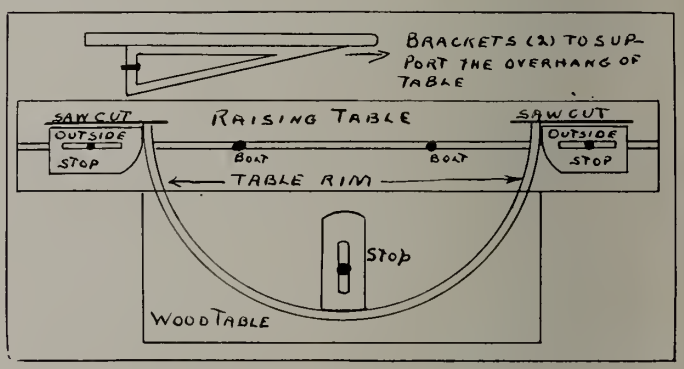
the top is raised the leaves come into view and may easily be extended by a slight pull. The leaves are so connected that when one is pulled they both extend to the full width. The leaves are attached to tapered slides so that they raise as extended thus bringing them to the height of the top. The top is lowered in place by releasing the lever and drops down flush with the extended leaves making a solid substantial dining table. A heavy moulding is run around the under edge of the top so that when the leaves are withdrawn and the top lowered in place the moulding completely hides the leaves. The size of the top ordinarily is 25 in. by 45 in. and when extended is 45 in. by 45 in. The table is made in various designs and in such woods as oak, walnut and mahogany.

Trimming Table Rims on Mitre Saw

W.D.

It has usually fallen to my lot to trim the ends of the bent rims for round tables. All along we have been doing this cutting on a single trim saw. When the last lot came through I decided to make a form so that by swinging the saws around parallel I could trim both ends in one operation on the automatic mitre saw that we have.

The accompanying sketch shows the form constructed. The wood table was first attached, by brackets, to the raising table of the machine, then the two outside stops and the one inside stop were attached. These stops are slotted so that they may be adjusted for accurate cutting and set for various sizes of rims. When the stops have been set for a certain sized rim I scribe a circle with the rim in



Form used on double mitre saw

place. This simplifies the set up the next time we have to cut the same size rim. All that will be necessary is to put a rim in place on the line and set the stops to it.

Using the machine as described we were able to cut the time formerly required to trim the rims, in less than half and in addition the operation was easier and more pleasant to perform.

When Jointing Sticker Knives

Faulty lubrication and tight belts ruin more heads on woodworking machines than everything else combined, therefore be sure to look after oiling and belts before you joint; it will save you work and worry. Jointing is only a process of trueing the knives to a circle. It is not a job calling for a lot of ability, but there are many things connected with it that will keep it from producing the deisred results, and will puzzle an old head, much less a beginner.

The cabinet trade is much indebted to the automatic lathe for turning out very intricate patterns very cheaply.

What becomes of the tire when the front of a bandsaw is badly heated?

Possibilities in the Shook Export Trade

Statistics Showing Extent of this Business—Principal Shook Exporting and Importing Countries—Comparative Tables Showing American and Canadian Exports

A somewhat exhaustive report of the world's export shook trade has been compiled by J. C. Nellis, assistant secretary of the National Association of Box Manufacturers, Baltimore, Md. The following information taken from his report, give a faint idea of the enormous extent of the export shook trade as well as indicating the principal shook importing and exporting countries. The Canadian box manufacturer should be able to successfully compete in many of these markets and should have a far greater share of this business than he is securing.

The extent of and the possibilities in the Canadian export shook trade may be judged by comparing the table of American exports with the following figures pertaining to the Canadian shook exports for the years 1914 to 1918:

Export Shook Figures for Canada

Exported to	1914	1915	1916	1917	1918
United Kingdom	$121,781	$ 85,618	$355,114	$454,917	$586,527

			Recapitulation		
British Empire	$166,869	$136,667	$446,867	$532,142	$658,183
Foreign countries	22,908	21,730	13,814	13,052	33,261

The report shows that export shook trade of the world is in round figures 500,000,000 feet a year. The principal exporting countries are Sweden 200,000,000 ft., Japan 85,000,000 ft., Norway 65,000,000 ft., and the United States 50,000,000 ft. While the shook importing countries are Great Britain, India, Straits Settlement, Canary Islands, Cuba, East Indies, Mexico and China with several others ranking close to the last named.

The approximate total annual imports of the chief shook importing countries are as follows:

	M. Feet
Great Britain	232,822
India	41,737
Straits Settlement	36,542
Canary Islands	19,865
Hawaii	17,982
China	13,609
Cuba	12,554
East Indies	12,189
Mexico	7,737
Holland	7,304
South Africa	6,947
Porto Rico	6,133
Australia	5,931
Germany	5,435
Argentine	4,675
Belgium	4,634
Ireland	4,634
Egypt	4,297
Persia	4,190
France	3,536
Italy	3,379
Canada	1,932
West Indies (except Cuba)	1,832
Spain	1,760
Siam	1,328
Peru	1,046
Central American	1,040
Morocco	972
Phillippines	896
Japan	826
Uruguay	776

These figures give an idea of the broad field that is open to any Canadian shook manufacturer who is desirous of engaging in export. If the American firms can ship shooks to the value of $400,000 to Mexico, $600,000 to Cuba, $500,000 to Straits Settlement, $150,000 to Hong Kong, and $150,000 to Egypt surely there is an opening in these fields for the Canadian product. This would appear to be especially true today when the demands are so great and conditions in the lumber markets so uncertain. The present appears to be the logical time to attempt to secure a foothold in these countries.

Conductivity, Odor and Taste of Wood

Heavy woods conduct heat more rapidly than light woods, oak conducting about twice as much heat as spruce under the same conditions, according to an expert at the Forest Products laboratory. Therefore for lining refrigerators and fireless cookers as light wood as practicable should be used. One of the principal properties that makes wood desirable for the household is its comparatively low heat conductivity and its use for handles, furniture, refrigerators, floors and walls is governed largely by the fact that heat passes through it slowly. In the case of handles, the difference to the touch between wood and metal is a matter of common experience. Wood conducts from two to three times as much heat with the grain as across it, other conditions being equal, and broadly speaking, conductivity of heat through stone and concrete is from 10 to 30 times as great through wood across the grain.

As a conductor of sound, wood along the grain is a fairly good medium, ranking with brick and stone, but across the fibre sound will travel only about one-third as well as with the fiber.

Most of our native woods are without pronounced odor or taste, but woods of the laurel family, of which sassafras and California laurel or myrtle are representatives, have adistinct spicy odor and taste. Port Orford cedar of the Pacific coast has a very spicy, resinous odor; other cedars have a more aromatic odor, especially the pencil cedar or juniper. Hemlock has a slightly sour odor while cypress is somwhat rancid. Except in cedars and junipers these odors are scarcely strong enough to taint the food unless it is brought into direct contact with the wood as in butter boxes. For wooden pie plates, butter dishes, bowls, buckets, candy pails, kegs and barrels, only woods are used which are without taste.

Increasing Output of Beloit Plant

The P. B. Yates Machine Company, of Beloit, Wis., are constructing a half-million dollar iron foundry. The new building, which must be completed by next fall, will be 206 ft. x 264 ft. This large addition to the foundry is expected to double the output of the whole plant. In the past the capacity of the foundry was not large enough to keep the machine shop going at full speed. The rapid growth of the business due to the heavy demand for woodworking machinery both at home and abroad is the reason why this increase in output was found necessary.

Machinery & Equipment

Light Combination Saw Table

The D. McKenzie Machinery Co., Guelph, Ont., are manufacturing a combination cross-cut, mitre and rip saw that is finding favor in many shops. The accompanying cut will give a good idea of the machine. The saw arbor, which runs in self-oiling bearings, is turned to take saws with a 1 in. hole. The table, iron, is 23½ in. x 30 in. and is hinged at the

Combination Cross-Cut Mitre and Ripsaw

back. Special cutters and dado heads may be used as desired. The ripping capacity is 13 in. wide. The counter shaft is adjustable so that belt may be tightened without having to cut and lace it. Speed of counter 900 r.p.m. Floor space required 30 in. x 36 in. Full particulars may be had from the manufacturers.

Elevating Factory Truck

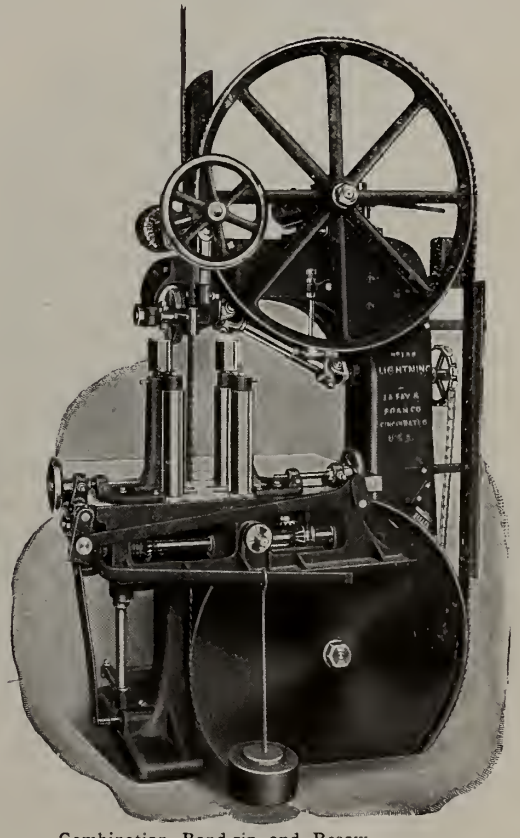
The accompanying illustration shows an efficient elevating factory truck that is being manufactured by the Chapman Double Ball Bearing Co. of Canada

Chapman Elevator Truck

Limited, Toronto. This is an all Canadian-made truck, all the parts being manufactured in Toronto. The wheels are equipped with ball bearings, which tend for ease of locomotion; in fact with this truck one man can readily move a load that with the ordinary trucking equipment would require four or five men. The platform is lifted and lowered by means of a chain-lifting mechanism, which can be operated with the handle in any position. A hydraulic safety check eases the load when being lowered and preventts any undue jarring. The yoke is mounted on ball bearings which makes for easy steering under heavy load and is so designed that the truck can be operated in very close quarters. The various ball bearings are practically dust-proof and require very little attention. The wheels need oiling once every four or six months, while the head or yoke should be oiled every month. The carrying capacity is governed largely by the size of the platform and varies from 1000 to 5000 lbs. This type of factory truck has been adopted by many manufacturers and is very convenient and efficient for furniture manufacturers and others who move a large number of truck loads of material in short lengths.

Band Rip and Resaw

For the smaller manufacturer who feels that his output does not warrant the installation of a band resaw and a band ripsaw, the "Lightning" combination band rip and resaw, manufactured by the J. A. Fay & Egan Co., Cincinnati, Ohio, should prove very attractive. As shown in the accompanying illustration, this machine is fitted with both resaw and ripping rolls. The change from one to the other is easily and quickly made. By simply reversing the table



Combination Band-rip and Resaw

and raising or lowering the ripping rolls, the machine can be converted from rip to resaw or vice versa. As a rip saw, it will cut material as wide as 24 in. between gauge and saw and at feeds varying

from 30 to 140 feet a minute. Used as a resaw, it will cut to the centre of stock 8 inches thick and split material 18 inches wide, at a speed ranging from 10 to 50 feet a minute. This machine may also be utilized as a scroll saw if so ordered. The top is 43 x 35, wheels 42 x 3½, blade carried 4 in. wide. The straining device is the Fay-Egan patented knife-edge balance. Full particulars of this saw may be secured from the above-mentioned company.

Open Back Nailing Machine

The Morgan No. 12-30 in. Open Back Nailing machine, shown herewith, illustrates the latest type of standard Morgan machines for nailing up crates and boxes.

The Morgan No. 12 Nailer is a heavy type, triple geared machine, fitted for direct gear connected motor drive. It drives from one to twelve 5d. to 10d. nails at a stroke. It can be adjusted to drive automatically some of these nails at one stroke and the balance at alternate strokes or any other combination that may be desired. The nails are driven in a single, straight row or a zig-zag row. This type of machine is provided with an improved and instantly adjustable clinching device which smoothly clinches the nails at the same time they are driven and enables the machine to do all kinds of cleating work.

While the Morgan Nailers are used regularly for nailing up boxes and crates, they have adapted their

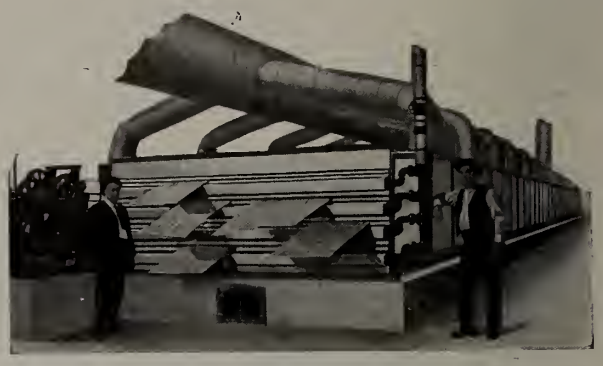
The Morgan No. 12-30 Open back Nailing Machine

standard nailers to do many kinds of special nailing. Their nailing machines are in use among furniture, automobile, trunk, toy and refrigerator manufacturers throughout the United States and Canada.

Full particulars may be had from the makers, the Morgan Machine Company, Rochester, N. Y.

Improved Automatic Dryers for Veneers

The Coe Automatic Roller Dryer for veneers is shown in the accompanying illustration. A number of improvements have been added to this dryer so that it embodies the latest ideas in the scientific drying of thin stock. The dryer is of the progressive type, consisting of a long steel flue or rectangular box, equipped with horizontal steel rollers between which the stock to be dried passes. An auxiliary blower system maintains a uniform circulation of warm air. The air travels from the dry end toward the end where the



The Coe Automatic Roller Dryer

green stock enters. As it moves through the dryer it absorbs the moisture from the stock so that the air contains a relatively high percentage of humidity when it reaches the stock at the green end of the dryer. This feature, which is the secret of successful drying, permits the outside of the stock to remain moist and insures that the stock is dried uniformly from the centre outward thus eliminating as far as possible checks, splits and other defects. Specially designed flues and baffle plates are used to secure an even circulation throughout all parts of the machine. The rollers which are in pairs, run in roller bearings. The lower one has a sprocket attached to one end and is driven by a chain belt. The upper one is driven from the lower roller through gears. The stock is fed in at the green end and emerges flat and dry at the far end. The speed at which it travels is under full control and depends entirely upon the thickness of stock being dried. The machine is of all steel construction and is designed so that all parts are readily accessible. In addition to the circulation of heated air, coils of steam pipe run from end to end of the drier.

It is built in three standard widths, five, eight and twelve feet and two, three, four or five pair of rolls high. The length and height depend on the quantity and kind of material to be dried. The Coe Manufacturing Company, Painesville, Ohio, are the manufacturers of this dryer.

An advertisement appearing in a British furniture journal carries the heading "Canada to the Front Again" and goes on to say that the firm in question is in a position to make immediate delivery of Canadian chairs (made by the North American Bent Chair Co., Limited, Owen Sound, Ont.) Is Canada to the front again or are the possibilities of the British market being almost entirely ignored by the Canadian furniture manufacturer? The business is there and should be well worth the trouble and effort necessary to secure and hold a portion of it.

Upholstering and Trimming

Can Upholstery Design be Improved?

Many Pieces Not Well Designed—Idea of Comfort Should be First Consideration

By W. L. D.

Present-day upholstering has probably reached its highest state of perfection in the production of the luxurious Chesterfield suites and the various forms of upholstered period furniture that are so popular with milady, but in the design of many of these pieces there is room for a great improvement. This does not apply so much to the work on the different period designs where the upholstering is confined to making a comfortable, dependable seat, as to the different lines of stuff-over furniture.

Many manufacturers who have tried to get away from the beaten track, have produced some very wierd effects, not only in color combinations, which to a certain degree are a matter of taste, but in the lines and designs of their product. Thus we find many pieces with flat arms, flat tops on the backs and built on almost square lines. Pieces that while costly, do not convey the impression of comfort.

Conveys Idea of Comfort

The idea conveyed by the word "upholstery" is one of luxury and comfort. Comfort expressed in graceful curves and well-rounded forms. If that is the case, should not this idea be carried out in all upholstery design? If it were, we would find the flat arms, the square effects and many of the straight lines replaced by well-stuffed, gracefully-rounded arms, seats and backs and lines that are suggestive of ease and comfort.

This impression of ease and comfort can readily be conveyed. We all know how when we see a Chesterfield chair with a low, deep seat and with well-proportioned and nicely rounded back and arms, that we feel a strong desire to lounge in that chair, and if we were to be given our choice of a number of designs, that that is the style we would naturally choose. Why? Is it on account of that impression which it conveys? There is room for a wide range of designs and styles without getting away from this idea.

Wings Add to Cosiness

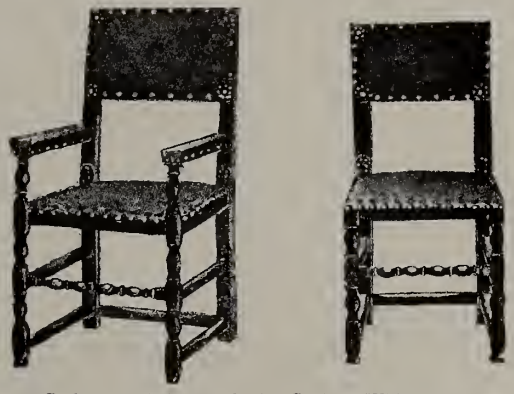
Then again, take the wings that are found on the backs of many chairs. Are they placed there simply for effect or appearance or have they a purpose to perform? Perhaps someone will suggest that they are attached to keep a draught away from the occupant. Is it not more probable that the main reason for their use is to add to the comfort of the chair, to give greater comfort? After one is tired of sitting upright in a chair, what is more conducive to ease than to recline cornerways with the head resting in the angle formed by the wing and the back? If they serve no other purpose, they will justify their use. However, if well-designed and proportioned they can be made to fit in and add attractiveness to the general contour of the chair.

A well-proportioned stuff-over piece with good lines cannot be satisfactorily built on a poor frame. The picture of the finished article should be in the mind of the man who works out the frame. This is a phase of the work, the importance of which is not fully realized and which in consequence is often overlooked. It is a subject that is well worthy the consideration of the manufacturer.

In addition to the design, the quality of the work must be maintained under all conditions. The best of materials and the best of workmanship should go in to every piece produced. When this is adhered to, and the rules of good design followed, upholstered furniture will then take the place it deserves—as a work of art.

From Aircraft to Furniture

A British organization that had a remarkable growth during the late war was the Grahame-White Co., Limited, manufacturers of aeroplanes. This firm, which turned out thousands of planes, upon the cessation of hostilities found themselves with a large, well organized and well equipped plant on their hands. Woodworking is a big feature in the manufacture of



Pad seat chairs made in Graham-White plant

aeroplanes so that with a suitable plant installed the attention of the company was naturally drawn to furniture. If the whole plant had been converted to this purpose the Grahame-White Co. would have possessed the largest furniture factory in the United Kingdom.

The accompanying illustrations show two chairs that are being produced by this firm. In addition a wide range, embracing all forms of furniture, is being manufactured. Orders are also accepted for furniture to be made to the customer's drawings and specifications.

The whole line is worked out along simple lines. This is due to several reasons the least of which are not the high price and scarcity of lumber and scarcity of labor. However there is an immense demand for this type of furniture for the middle and working-class homes.

Leather and the Coming Market

The following comments on the leather and material market are from a statement by J. L. Schnadig, of the Pullman Couch Co., in their shop paper "Pullman Service":

"Difficulty in buying is being met with by the manufacturer as well as the dealer. It is hard to tell who is having the most trouble.

"I have just returned from a trip East, during which I investigated the fabric situation. One big jobber, after a pleasant welcome, greeted me with, 'I hope you don't want to buy.' And before he got through he was offering to buy of me anything of which I had surplus. He said: 'During the past month I have bought as much back from manufacturers as we have been able to get from the mills'. He claimed that it was practically impossible to place orders with mills.

"Velour mills report that at their present rate of production they are sold up for the entire year of 1920. One firm advises that they are sold well into June and July 1921.

"One mill makes the announcement that they will cancel all orders that remain unfilled on January 1st, and will then pro-rate their product for sixty days. After the sixty-day output is delivered they will sell another sixty-days'-worth on the same basis—and so on.

"Another mill reports that they will cancel all orders and will sell goods only after they are made—price to be based on cost of each item.

Damasks are off the market, and you might as well say the same thing about velours.

"Leather is at a point where we cannot see where we (or any other furniture manufacturer) can continue to buy it. It's a gay life."

Consistent or Inconsistent

By M. Wulpi

A large subscriber writes us as follows:—"Knowing your interest in eradicating the discount evil which is practiced by so many merchants throughout the country we take the liberty of bringing it to your attention as we feel it is an opportune time for manufacturers and distributors to eradicate it.

There is practically no competition in the sale of goods, merchants are all crying for goods and are willing to pay most any price for them, and terms are a great factor in the price; therefore it behooves the manufacturers and distributors to educate those merchants who pay no attention to terms, and impress upon them that the terms stipulated on the invoices mean exactly what they say.

A number of houses show their terms in the abbreviated way of "as usual." This means nothing and we believe that some manufacturers really mean by these terms that the customer may pay as he chooses, as we find in our experience that a number of manufacturers are willing to grant cash discount any time the check may be received.

There is also a great evil on the part of dealers in basing their settlements upon date of arrival of the goods, when the terms as made are from date of shipment. When making terms of 2 per cent. 10 or 2 per cent. 30 days the manufacturer or distributor has already allowed a certain length of time in which the customer may receive the goods, and if there should be further delay than that time the dealer should be willing to discount his bill and finance it for the remainder of the period himself, for the length of time it may take.

If all manufacturers and distributors will watch the discount and insist that terms of sale be complied with, some of the houses that make it a habit to take discount any old time will be obliged to change their method of paying. But if all of us do not co-operate, then the distributor or manufacturer who is trying to make the dealer live up to terms has a very hard position, and those manufacturers who permit the dealer to discount when he chooses makes it just that much harder for those who are trying to have the merchant live up to correct business principles.

We have also noted recently a number of dealers stipulate on their orders as follows: "This order is placed with the distinct understanding that the cash discount period will be determined by date of arrival of the goods regardless of date of the invoice." We feel that orders sent in with such stipulations should not be accepted, and if we will all take this stand the dealer will not expect it, but if some of us go ahead and accept orders on such conditions we might as well do away with terms entirely and let the dealer discount and pay his bills when he chooses, and we all realize what this would mean to business as a whole.

Unique Form of Upholstering

In Portugal they employ a unique method of upholstering that is economical at the same time, for it enables small pieces of morocco and other expensive material to be utilized. One Portuguese firm is making a fine line of reading chairs, tub shaped and full stuffed in English morocco. There is a half-diamond buttoning all round the back, with a high roll stuffing above. Instead of the usual pleats between the buttoms and over the roll top, always a worry to the upholsterer, the leather is cut in half-diamond sections, with scarcely any fullness; instead of pleats there are welts between the buttons, downward and over the top, a sensible, neat, economical, utilitarian form of upholstering, particularly well adapted to concave stuffing.

Training Departments Pay Dividends

Two hundred manufacturers who have established training departments in their factories have voluntarily testified that their labor turnover was cut in half. One of these manufacturers reports to an official of the United States Training Service that the turnover among the operatives to whom he gave training was but 1 per cent. a month, while among the remainder —those without such instruction—it was 15 per cent. a month. The saving in the cost of hiring is manifestly very considerable in a case like this. But that is not the only gain. The amount and value of the product delivered by the trained worker is much higher than the yield of the untrained worker. It is quite apparent that the employee who has a complete understanding and control of his machine, a large and satisfactory production, and consequent sense of security in the tenure of his employment of good wages is not likely to become an item in turnover.

The edges of the joints in the refuse pipes should be towards the outlet, else the refuse may catch in them and eventually stop up the pipe.

Enamelling High Grade Furniture

Preparation of Surface and Undercoats Determines Results—Only Thin Coats of Enamel Required on Suitable Foundation

By Dixy Wells

The securing of a satisfactory enamel finish on high grade furniture requires the employment of skilled workmen and reliable finishing material. Quality in ground work and material must enter into the production of this class of furniture if a fine finish is to be secured. First-class enamel work is expensive but the manufacturer has the satisfaction of having turned out an A 1 piece of goods, one that he need not be adverse to placing his name on.

The preparation process on new work consists of thoroughly sandpapering all quirks and turned parts with coarse sandpaper and the plain surfaces with a finer grade. This is quite a simple matter until the work has been coated, but after that much skill of hand is required to rub down such parts without injury to the sharp edges. The glass paper for this work should be extra tough so that it will bend readily into any shape desired without tearing into shreds. It should be cut into suitable strips for use on the various parts.

Preparing the Foundation

When the new wood has been thoroughly cleaned, the best priming coat, if you are not using a standard ready-mixed undercoater, is composed of a hard copal varnish, a little turps and white lead. This should be applied thinly so as to penetrate the wood thoroughly, and after it has been allowed to become hard should be rubbed down. Then putty up any holes or imperfections with dry white lead, whiting and japan gold size. This putty is mainly intended for use in the open joints and when it hardens another coat, consisting of a little japan gold size, one-third varnish and two-thirds turps, combined with white lead or other pigment, as required, should ge given. After the first coat, No. 1 and No. 0 sandpaper only should be employed, the latter being reserved for rubbing down the final coats.

After this two or three coats of filling should be applied with a good broad chisel or scraper on the flat surface and with a brush on the curved parts. For laying with the brush the filling up paste should not be much thicker than good stout paint so that it may be laid easily without leaving streaky ridges difficult to remove later. Between such coats of filling, sanding should take place, and if necessary, rubbing down with pumice stone. If after this the surface is not thoroughly smooth other coats of filling should be given until it is.

Contrast Coat Shows Inequalities

Make sure that the surface is quite level. It is sometimes advisable, especially, when working away from the light to give the filling a guide coat, that is, simply a thin contrasting coat of sharp paint almost flat, which when properly rubbed down shows by its difference in color any defects in the surface.

The surface now being level, two coats of the second coating should be given to prepare for the proper finishing coats. These latter consist of white lead ground in turps, and up until the last coat thin down with equal quantities of white oil varnish and turpentine, the last coat being slightly different and having a little more varnish. All these coats should be merely thin washes of color and should be allowed to harden for two days between each application, and if possible, even longer.

The rub-down between each coat should be done with the finest sandpaper until the last two coats, when ground pumice stone and felt should be substituted. The number of these final coatings vary under different circumstances.

Applying the Enamel

As furniture is intricate it has many small, sharp-edge surfaces. Much care must be expended in avoiding "fat" edges of enamel and "runs." The bottom bars and legs of chairs, for instance, should be coated first, then the back and finally the fronts and bottoms of the seats.

If possible, each article should be placed on clean blocks of wood about two inches high and kept in this position during the work and until thoroughly dry. If possible the work should be done without moving the furniture, and in consequence raising the dust.

The tops of chests, of drawers, tables, dressers, and seats of chairs, should be done with a different brush from that used on the other parts, as the application of enamel to those portions is liable to dirty the brush, owing to the minute dust particles in the atmosphere, which, despite every precaution to the contrary, fall constantly on horizontal surfaces. Although in general practice heavy coats of enamel are necessary to obtain a smooth flow, in this particular class of work such is not needed for two reasons. First: The surface is already as smooth as possible and a light coat laid on without working it much is quite as satisfactory in appearance as a heavy one. Second: A heavy application on work to be handled and sat upon sometimes leads to tackiness—a grave defect in furniture finishing of any kind.

Cold Water to Harden Surface

When the first enamelling has been allowed to harden thoroughly it may be sponged with cold water to still further harden the film, and then felted with pumice stone powder of the finest quality and finished with another coat of polish.

Where much furniture painting or enamelling is done a special room should be set apart for the purpose. It should be well lighted, have a radiator at each end and strips of felt should be tacked around the door, bottom and sides, to prevent draughts, necessary change of air being brought about by ventilation at the top of the walls. When in use in win-

ter the apartment should be kept heated continually at about 70° Fahrenheit. This amount of heat must not simply be tested by feeling, but by having a thermometer hung in the middle of the room.

Refinishing Old Work

In the case of refinishing old furniture, a condition which is sometimes necessary in factories, the piece being old and perhaps badly chipped and cracked, a more tedious process than a preliminary sandpapering must be gone through. In this case the preliminary preparation consists in removing the old defective paint, polish or whatever it may be, with any one of the standard non-injurious paint and varnish removers, and finally washing the whole down with turpentine. A scraper may be used here to assist in the removal of the soft paint, varnish or enamel film, but if possible only rags dipped in turps should be used for this purpose. At any rate on all receded parts this method is always the only proper one. Scraping with a knife is liable to scratch the wood in such parts.

This initial process having been finished the work should now be sandpapered before first coating. It is advisable sometimes to rub carefully with lump pumice, curved and round portions such as chair legs being well sandpapered when dry. Owing to difficulty, however, in getting pumice stone to fit these parts it is advisable to use glass paper on them, for pumice which does not lay properly against the surface is as a rule sure to scratch the work.

French polished furniture may be painted after a preliminary wash and rub with glass paper. If the polish is not adhering very firmly it should be removed to give a less brittle foundation.

Working With Gold Leaf

Gilding is one of the easiest things in the trade to do well, if done with proper material and with due regard to cleanliness in working; but painters who have little experience in gilding nearly always show up badly by reason of the poorness of their gold size and their carelessness in working.

For church work it is desirable to use the best oil gold size whenever possible, especially for large patches of gilding—such as the groundwork of medallions or panels. For gilding the parts of a pattern that is stencilled, or for pencil work, japanner's size is sometimes necessary and often useful as a saver of time, especially when the work is not easy to reach. A mixture of the two, making a size that will dry in about four hours, often secures the main advantages of both, and if the worker arranges to do all sizing in the forepart of the day, and gilds in the afternoon, he will be under no necessity of staying after time to finish any of the gilding.

Oil gold size is a far better base for gilding on than japanner's or quick gilding size, and it allows a very wide margin of time for the application of gold leaf. When very large letters and other gilding requires doing and can be done indoors, the same should be done with oil size, which, in addition to allowing a longer margin of time for gilding, makes an excellent finish, both in solid appearance and burnish, that is far superior to japan gilding. The work also lasts three or four times as long when on an oil base.

For all work that is required in haste, and for small work, lettering, lining, etc., japan size is better than oil, even for indoor work. For such work as gilding in a restaurant, where one might expect greasy steam to get on the size, it would do no harm to japan size, but a film would be formed on the oil size; and although the latter might gild all right, yet on washing it would all come away—as would be the case with ammonia fumes from a stable.

Japanner's size is useful for articles which have to stand great heat, and for work out of doors in dust and wind.

Protect Hardwood Flooring from Dampness

Hardwood for flooring is a wonderful gift of nature in the first place; it is also a fine product of the manufacturers' art as it is prepared for the use which it is to withstand.

Nevertheless, a little carelessness on the part of any of the people through whose hands it must pass may undo all this careful work. It cannot be too strongly impressed upon every one concerned that the greatest care must be given to hardwood flooring both before and while it is in the process of laying. Knowing what great care has been given in kiln-drying, in shipping and storing, only an ignorant workman would fail to realize that it must not be unloaded in rainy weather. If the air is damp it should be covered with a tarpaulin in the wagon. It should never be piled in open sheds, even though protected by a roof, as the wood absorbs moisture at the exposed ends, making it swell, so that it will shrink later, undoing all the careful work of manufacturer, producing a condition from which it is impossible to make a beautiful floor.

Hardwood finish of any kind should never be laid in a new building until all dampness is out of the walls and the plaster is in proper condition to receive it. The finished floors should be the last work done in the building. To secure the best results the painting, papering and decorating should all be done and be thoroughly dry before the finished floors are laid.

When they have been properly laid and treated, beautiful floors are the crowning achievement in the building of the home.

A New Unjammable Door

Many lives are lost annually in railway and shipwrecks through doors becomming jammed in their frames, thus imprisoning passengers in staterooms, lavatories, etc. To prevent this a door known as the Henderson Unjammable Door (patented) has recently been designed and the Canadian rights offered for sale. The door is very simple in construction, the special feature being that the top, bottom and lock side are bevelled to an angle of about 30 degrees. The door frame instead of being rabbeted is bevelled to suit, thus any twisting or distorting of the frame merely tends to force the door open. A special lock has been designed so that even though the door is closed and locked, should an accident occur and the door frame be forced out of square, the catch is released and the door opens. The C. P. R. have adopted this type of door for the new passenger boats that they are at present building in Great Britain.

This form of door should prove desirable in cold climates. The bevel on the door and on the frame eliminates all friction and rubbing as the door closes. Thus the edge of the door and, if necessary, the bevel on the door frame could be covered with a thick felt, making an absolute wind and draught-proof door.

Is This a Good Method of Fuming?

Fuming on the Natural Wood Does Not Raise the Grain if Live Steam is Done Away With—An Interesting Description of the Method Followed by one Large Manufacturer.

By A. D. Ralphe

Having read many interesting articles, in the "Canadian Woodworker." on the fuming of oak, where acid fuming stain or toning washes were applied to the wood before the stock was placed in the fuming box, I thought that a description of the method we employ might prove of interest. Our line, pianos, is one calling for a high-grade finish and an even color in all parts, so that the finish that satisfies our trade should prove satisfactory on any other line of oak woodwork.

Before outlining the method employed in finishing our cases it might be well to describe the result that we strive to secure. Our aim is to produce a rich brown fume, not a dark brown, but one that has plenty of depth and color, and to secure a perfectly smooth surface with a dull finish.

We carried out various experiments with the different fume washes and acid tone stains. but in practically all cases, while a very attractive color was obtained, there was a tendency to raise the grain, and thus increase the amount of sanding required to produce the finish that our trade demanded. The same was found to hold good when live steam was admitted to the fuming box. It did not seem to make any difference what the previous treatment had been, the moisture of the steam raised the grain fibres of the wood, producing a rough surface.

When the oak cases reach the finishing room they are as smooth as fine sandpaper and skilled workmen can make them. Instead of treating the wood in any manner that might tend to raise the grain we place the work directly in the fuming box and turn on the ammonia. Full strength liquid is used and the stock is usually left in for about twelve hours. The fuming is generally commenced at night and the pieces removed sometime during the next morning. A small pane of glass has been fitted in the fall of the box so that the progress of the work may be watched. The electric light inside is controlled by a switch conveniently located on the outside of the fumer so that a close tab may be kept on the rate at which the stock is fuming. In filling the box it is advisable to make a point of placing a piece near the opening so that the depth of color may be judged as the fuming progresses.

When the stock is fumed in this manner it is as smooth when taken out as it was when placed in the fuming box. If the work has been well timed and a good, even color secured the finishing coats consist of two thin coats of white shellac that has previously been darkened slightly by the addition of a little bismark brown.

As anyone knows, who has tried fuming, all the stock does not take an even color and many expedients need be resorted to before an even shade is secured. If the shade is darker than required we finish it with two coats of shellac that has not been darkened by the addition of any coloring. This tends to give a lighter finsh. When the fume did not take deeply enough we have found that a coat of boiled oil both darkened and improved the shade. This is applied before the shellac and allowed to stand several hours without further treatment. The oil is not used for touching up light streaks or spots, but only where large surfaces need toning up.

After the work has received the first coat of shellac we sand it and touch up all the light places. This is work calling for a fair amount of judgment, for if too much color is applied the result will be a dark spot or streak. It is wonderful how closely one can judge the different shades and know just how much coloring to apply to secure an even tone.

The touching-up process requires a good light, so is is usually done near a window, preferably a north one. The material employed consists of a mixture of white shellac, bismarck brown, and. if required, a touch of nigrosine. A number of mixtures are made consisting of varying strengths or shades and arranged in order in tins on the bench. If the streak is a very light one the darkest mixture is used, while if the contract is not so marked a lighter shade is applied. Sometimes the brush is dipped in several cans in order to secure just the exact shade. We have found that working this way it does not take long to run over a case.

After the color has been evened up another thin coat of shellac is applied, and the work is ready to be shipped out. We have tried orange shellac on several occasions, but prefer the results achieved through the use of the white article.

If any who read this would like to ask a few questions about fuming or would like to criticize or discuss any part of the article, just write in to the publishers of this journal, and I will do my best to reply.

B. C. Concern to Manufacture Furniture

The December "Canadian Woodworker" contained an item referring to the incorporation of the Canadian Western Woodworkers, Limited, Victoria, B.C. This company was organized to take over the plant and business formerly conducted by Cousins Bros. This new company, which has a capital of $50,000, has been granted a loan of $10,000 by the B. C. Provincial Department of Industries.

The plant, which has been idle for about a year, is a modern, electrically equipped woodworking plant. Additional machines will be added and everything is in first-class running order. The lines to be manufactured include furniture, show-cases, interior fittings, sash and doors, etc. Between twenty and thirty men will be employed, most of them returned soldiers. It is the intention of the concern to take on as many Soldiers Civil Re-establishment students as possible. The policy outlined by Len Cousins. president and managing director, is to employ no Asiatics, to cut to a minimum the overhead expenses, to employ returned men wherever possible and to work on the principle that quality rather than quantity is of major importance.

Lieut. A. Dean will have charge of the offices. M. Macgilivary, who served overseas, is the vice-president.

Marietta Co. Appoint New Salesman

John E. Johnson, veteran finisher, who for the past five years has been with the Luger Furniture Co., of Minneapolis, has taken a position in the sales service department of the Marietta Paint & Color Co., of Marietta, Ohio. His last position with the Luger Furniture Co. was that of foreman finisher in their North St. Paul factory. Mr. Johnson's first assignment in his new position will be through the Northwestern District, which is managed by Charles E. Wilson, of Grand Rapids. His part of the district will me Minnesota and Wisconsin.

This is in line with the regular policy of The Marietta Paint & Color Co. to recruit its sales force entirely from the ranks of thoroughly experienced and practical finishers. It enables them to give valuable service to their customers and they regard service as the keynote of good salesmanship.

Finishing Small Handles

If the handles are small, make a tray of screen wire, tacked on to a wooden frame. Place the handles on this tray and immerse in dipping varnish. Raise and allow them to drip, agitating the tray so as to move the handles slightly.

Some work may be re-dipped within fifteen minutes after its first immersion. The advantage of the double dip is that the varnish may be used very thin and hence will run off cleaner.

Black handles should be dipped in a filler liquid, dried, "tumbled" and then enameled.

Striving for Minimum Costs

By Progressive Foreman

Lumber and veneers, in fact materials of all kinds, are today very expensive and in practically all instances the prices are beyond our control. What we can do, however, is to use a fair amount of skill and headwork in working the different stocks and thus in some measure help to keep our manufacturing cost from climbing out of sight.

One reads a lot today about system. System is a prime necessity in the successful operation of any plant and all factories either large or small should be run along systematic, but too much system is almost as bad as too little. Another point that is every bit as important as the employment of an efficient system is a thorough knowledge of the plant and the limitations and capacity of each department.

Many small manufacturers are trying to maintain a large output in a small factory, with inadequate equipment, while others are making too many lines. Take as an example the small furniture factory that is producing diningroom, bedroom, parlor and den furniture in addition to other lines. As expected there will be found endless confusion and shortages in most lines and an unnecessarily high manufacturing cast. It is far better to attempt the manufacture of large quantities of one or two lines that suit the equipment of the plant than to be about half equipped to take care of a larger number of lines.

When introducing methods and equipment, in an attempt to lower the cost of production, one should consider the large amount of unskilled labor that is being employed in our woodworking establishment. To overcome this the very latest and most modern machines—machines that are largely automatic or at least require little attention—should be installed.Even when none but skilled workmen are employed the latest equipment is a good investment as it tends to increase production and decrease the operating or production cost.

Close co-operation between the purchasing and manufacturing departments is a very desirable feature. The buyer should keep in close touch with the foremen of the different departments and make a point of consulting with them on all purchases for their department. In this way the material most suited to the work in hand will be secured and many needless and expensive operations eliminated. The jointing of narrow veneers, the building up of heavy stock and many other similar operations, which only increase the cost, could be avoided by figuring on requirements and securing material of a suitable size. Such stock should work out advantageously even though it were to cost more money. In addition the machines would be clear for other work and the fewer operations the fewer the chances for mistakes occurring.

Retail Furniture Dealers Form an Association

A retail furniture dealers' association was formed at a convention of dealers from Western Ontario which met in Stratford, Ont., recently. There were about 50 dealers in attendance and organization proceeded as far as electing a president, Mr. Guy Luke, of Hamilton, and an executive council of five members with power to select the other officers and call a further meeting. The members of the council are N. K. Keene, London, who acted as secretary; Fred Burroughes, Toronto; C. N. Greenwood, Stratford; Frank Goodwin, St. Thomas, and W. J. Parsons, of Sarnia.

The dealers felt that they had a grievance against the mail order houses, which they claim have special consideration shown them in having prices guaranteed them for several months ahead.

The furniture manufacturers of Stratford gave the delegates a banquet in the evening, at which some further views were aired.

High Labor Costs Close Factory

One of the leading British piano-making firms has taken action which is regarded as an object lesson in the economic fallacy of pushing the demand for improved labor conditions to the extreme. John Brinsmead & Sons have announced their decision to retire from business and close their factory, in which over 300 people are employed, some of whom have been in the firm's employ for forty years.

Brinsmeads point out that for each piano turned out per week there are now 24 employees against 12 in 1918, and six before the war. Factory wages alone per piano exceed the selling price. The cost of polishing alone is approximately equal to the pre-war prime cost of the completed piano, including the materials.

MAPACO DYESTUFFS

Pure, strong aniline dyes, made especially for use in dyeing wood

MARIETTA WOOD FINISH SPECIALISTS

KOPALAC

While Kopalac is used instead of shellac and is more economical than shellac, it is more than a "shellac substitute."

It has a heavier gum body than shellac and holds up varnish coatings better.

It is ideal where a wax finish is desired.

For mission finishes it is A A-1.

Kopalac mixes readily with shellac.

It is made in both amber and white.

It is thoroughly practical.

Write for full information.

When you buy dyes without special caution as to their adaptability for dyeing wood, you may get dyes intended for textile fabrics. Many manufacturers make no distinction between the two.

Mapaco Dyestuffs have a special affinity for wood. They bite into the wood fibre, giving that clear, deep brilliant effect so characteristic of Marietta finishes.

Write for sample.

Mapaco Dyestuffs are STRONGER

Staining and Finishing Various Mahoganies

Coarse Grain of Genuine Mahogany Requires Paste Filler—Use Shellac to Lay any Fuzz or Raised Grain—Formulae for Different Stains

By A. A. K.

Mahogany may be classed as the finest wood in general use for finishing; that is to say, the finished effect is the finest, for it is not without its drawbacks as regards the process of finishing, and the cabinetmaker also may have his testimony to offer against it. All decorative woods, as we may term them, have their difficulties of finishing, but if the effect or finish is perfectly satisfactory we may well forget all the trouble the wood has caused us.

For some time we have been reading of the ever-growing scarcity of mahogany, but there seems always to be enough for the demand, and now we learn that a wood is being imported from the Philippines which is said to be as good as the genuine mahogany, yet not more costly than quartered oak. Like nearly all Oriental woods, this Philippine mahogany is full of pinholes—very tiny ones, in this case—but these may easily be filled. The wood is in two colors, white or pale, and reddish. Of course, each color should be used by itself, though if mixed the finisher well knows what to do to equalize the two in tone and make a fine, solid-appearing finish.

Genuine mahogany is a wood of rather coarse grain, and hence requires a paste filler. One may be somewhat careless when finishing ordinary oak or ash, but with mahogany it is different; we must be extremely careful to fill the wood right, or the finish will be far from satisfactory. The proper way is to fill the wood level full with filler, making a quite solid surface that will be impervious to subsequent coatings of any kind. This is the secret of success in finishing this fine wood. With this finish follow with a coat of shellac, which is rubbed down smooth when dry, using fine sandpaper; then another coat of the shellac, rubbing as before, and finally finishing with two or three coats of varnish.

Another trouble with mahogany is its fuzz, arising from the spongy or soft parts, the fuzz coming up after the smoothing done by the cabinetmaker, and enhanced after the liquids go on it. In some cases this fuzz runs in two or opposite directions, adding greatly to the difficulty in finishing it or in planing it. Stain or filler will be caught by this fuzz, causing a cloudy effect. The remedy consists in applying a very thin coat of shellac to the parts after the stain has been applied, not before, using water stain. Then the filler may be applied. The object of the shellac coating is to glaze the spot over and prevent the filler from lodging in the fibres of the fuzz. After filling the job let it stand for twenty-four hours, though forty-eight hours would be better still. After rubbing it down with fine sandpaper it will be ready for the finishing.

It is advisable to apply a very thin coating of shellac to all parts of mahogany, in order to get a solid and unclouded finish. Color your filler to match the color the finished wood is to be.

I have spoken about the Philippine wood, which comes in very light and reddish colors, and would say, too, that genuine mahogany is of rather light color, something like Spanish cedar or cigar box wood, and a little staining always improves the color, not only making a more uniform coloring, but making a richer color, too. But it is advised never to stain the wood very dark, unless the wood is of an inferior grade.

When mahogany becomes time-stained we call it antique; it presents an appearance very much dissimilar to the fresh finish, which is of course to be expected, and it is then very much admired, so much so that some clients demand the imitation, at least. This may be accomplished by fuming the wood, or by means of alkalies, like bichromate of potash, or lime, in water. Weak fresh lime water gives the wood a rather reddish tone. We may also use a mixture of turpentine, two parts, and raw linseed oil, one part; rub this well into the wood, then wipe off dry. Let this become quite dry, then apply a solution of bichromate of potash (in water), and when this has become dry apply the paste filler and shellac and varnish for the finish.

Woods other than mahogany, those suited to the purpose, may be mahoganized by coating with dilute nitric acid, rubbing it into the wood. Then a stain of dragon's blood, 1½-oz., dissolved in 1-pt. of alcohol, filtering it, then adding one-third its weight of carbonate of soda. This liquid is to be applied with a brush, and several applcations are to be given, when the wood should have the appearance of polished mahogany. Should the luster fail, then restore by rubbing with a little raw linseed oil.

If you desire an old mahogany shade, use a water solution of bichromate of potash. For a richer tone employ an aniline soluble in both water and alcohol. This may be applied to the new raw wood, but most finishers prefer staining after the wood has been filled. Rub smooth and apply a coat of shellac. This will bleed the stain and thus hide the sandpaper marks, also preventing the oil in the varnish from entering the wood. Oil will cause the wood to darken slightly. Piano finishers are very careful to see that oil never gets at the raw wood, and yet I am reminded of the fact that some finishers use as much as 40 per cent. of oil with turpentine and japan driers. They claim that the turps carries the oil so far down into the wood that it does no harm to the color. Thus it is simply a question of individual preference, based on experience. Personally, I do not like to let the oil into the raw wood, and even shellac I would want to bar out. Water stain is best, finishing with three or four coats of varnish.

An old and very good paste filler for mahogany may be made upon this formula: Take equal parts by weight of finest whiting, plaster-of-paris, powdered pumicestone and litharge, with a little soapstone powder and Vandyke brown, burnt sienna and French ochre, using your judgment as to the amounts of each, according to tone desired. Mix to a paste with one part of japan, 2 parts of boiled oil and 3 parts of turpentine; grind the mass in a hand paint mill. This filler answers also for rosewood.—Veneers, Indianapolis.

The higher the wages paid in a mill the greater the tendency to install labor-saving machines.

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

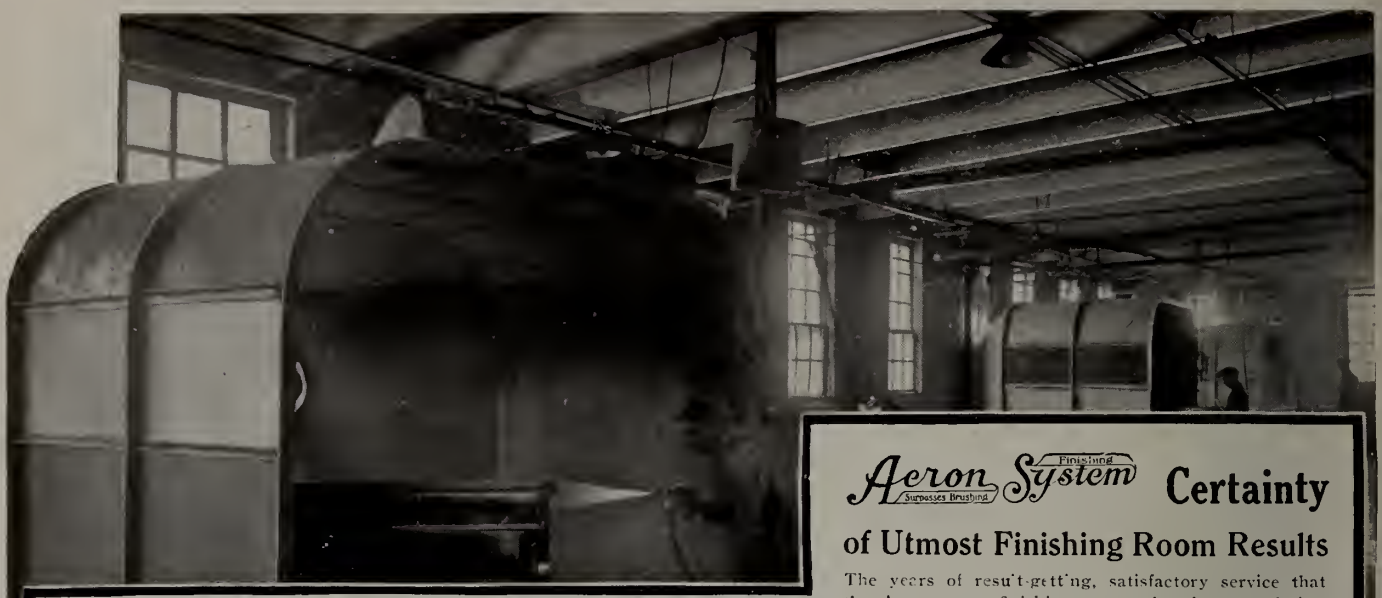
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



Aeron Finishing System (Surpasses Brushing) **Certainty**

of Utmost Finishing Room Results

The years of result-getting, satisfactory service that the Aeron spray-finishing system has been rendering the wood and metal-working industries, gives to each new installation of this equipment an assurance of the utmost in quality, speed and economy.

No matter what type, size or grade of product you manufacture, nor with what kind of finishing material you coat it—the Aeron System undoubtedly is now being used on work of the same or similar character, and will be most certain to make it possible for you to do the highest grade of work at a big reduction in costs.

Operation Facts One Aeron operator easily does the work of 2 to 6 or more hand brushers—governed by nature of work.
A cleaner and more uniform coating of every material is applied—there are no brush marks, thin spots or fatty edges.
Work is made absolutely healthful and safe—all fumes are completely removed.
Equipment is kept in the best working condition at practically no cost.
The Aeron System is sold on a strictly guaranteed basis, and every installation followed up by a competent service organization.

Write and let us send on more definite particulars.

THE DeVILBISS MFG. Co. 1318 Dorr St., Toledo, Ohio, U.S.A.

High Grade Stains and Fillers

In our Stains you will find the highest possible color values—they are positive—they are permanent. Manufactured in quantities from the best quality raw materials.

Wood Fillers also that have been tested under the most difficult of varying circumstances and found satisfactory.

Eliminate trouble in your finishing department by using these tested materials.

Veneers and Panels

Making The Veneer Department Pay

Demand For Panels Emphasizes Importance of Glue Room—Simple Factors That Tend for High Veneering Costs

By R. A. N.

The time is not very far distant when the manufacturer, who used a limited number of veneered panels, found it more convenient, and often cheaper, to purchase his requirements from some concern who made a specialty of this line. Apparently, however, this time is passing. The great inroads, or demands, that have been made on panel plants by the unprecedented demand for phonograph material, phonographs are practically an all-veneered product, has in many cases loaded these plants with more orders than they can readily fill. That being the case, the small panel user often experiences difficulty in having his wants supplied.

The only course open to those so placed is to glue up their requirements. It stands to reason that the large producer of built-up stock can turn his product at a lower cost, but that is not a valid excuse for any manufacturer to allow his veneer equipment to lie idle. If a manufacturer can purchase panels for less money on the outside market than it takes to produce them in his plant, the proper procedure would be to analyze his methods and costs and see where the fault lies. From this it is an easy step to remedy the trouble.

Looking for Weak Points

If the work is followed step by step and every operation criticized, undoubtedly many instances will be found where operations can be simplified and even eliminated, with a material lessening in the amount of handling required. In addition, there is a strong likelihood that it will be found that the addition of a few pieces of modern labor-saving equipment will decrease the cost of building panels, so that what is now a glue-room loss will be turned into a profit.

Many so-called glue-rooms are in reality glue-rooms in name only. In the first place they were never intended or planned for large or profitable production. Consequently the equipment required for the efficient operation of this department is often conspicuous by its absence. Many factory owners, who spend more freely on other departments of their plants, hesitate before adding veneering equipment.

In some plants where the veneer room is fully equipped with the most modern labor-saving machinery, it is found that production costs are high or that production is so low that it pays to purchase, as far as possible, the requirements on the outside. This merely tends to show that modern equipment and an inefficient crew is not any more capable of producing results than a carefully-trained crew in a glue-room with poor equipment.

An analysis of the glue-room problems will show that there are many little items which, to a great extent, have a marked influence on the efficiency of and procuction from that department. Many veneer rooms could easily turn out twice the quantity of work if they would only use common sense and realize the definite results that could be brought about by certain simple changes.

Glue Not Handled Carefully

One of the most prolific sources of loss in this department is the misuse of glue and veneers. While visiting a plant recently, I spent some time in their glueing department. This was a very up-to-date part of the plant, being equipped with modern machines, but while there, I observed the man in charge of the glue spreader mixing a batch of glue. Instead of mixing this in a tub with cold water and allowing it to soak, he took the dry glue and put it directly into the still warm glue kettle and poured warm water over it. This was undoubtedly to hasten the soaking. It had never occurred to this individual or to the man in charge that by mixing glue in this manner fully 10 per cent. of the value was lost. If the full length of the glue is to be realized, it must be soaked in cold water, not hot or even luke-warm, preferably over night. This given it plenty of time to dissolve and much better results will be secured.

Experiments have shown that to secure satisfactory results and a uniform mixture of glue, a known quantity of water must be mixed with a known amount of glue. How does your glue-room man mix his glue? "Oh, well," you may say, "he uses that pail over there for measuring both glue and water, mixing as a rule one pail of glue with two pails of water." That is not accurate enough. A common pailful of glue will often vary from 2 to 8 lbs. in weight, depending upon the thickness and the size of the flakes of the glue being mixed.

How Losses May Occur

This uncertainty is present in many veneer rooms. Suppose six batches of glue are mixed each week and if in mixing each batch there is a variation of from 2 to 8 lbs. in the amount of glue mixed, or, in other words, if there are from 2 to 8 lbs. more glue used than the amount of water used calls for, what becomes of this additional glue? It is simply lost, thrown away or wasted. When such a haphazard method is followed, how can the spread of the glue per pound be determined, or seeing that no two batches are mixed in exactly the same proportions, how can the values of the various lots be compared? Suppose that in two weeks this wastage would run to 30 lbs.; at present glue prices this would mean a considerable loss, and when figured by the year, the figure would be large enough to make any thoughtful glue-room foreman or factory manager stop and think.

When glue is bought, it is weighed and bought at so much a pound, and if a person were going to sell

it, a scale would be purchased and the material weighed, so that justice would be done the purchaser. Is it not just as logical that a scale be provided for the glue-room and then insist that the water and glue entering into each batch be carefully weighed? One would hardly buy a barrel of glue by guessing at its weight, and why should guess-work be employed in utilizing it? The most efficient glue-room operator could not guess the exact quantity of glue taken from a barrel and the proper weight of water to use with it and, therefore, should not be held responsible for accuracy in work and product unless provided with proper equipment.

Efficient Redrying of Veneers

What about the veneers? No doubt these are re-dried before laying, but what method is employed? Has a veneer re-dryer been installed or are the sheets merely hung up in a hot room and their moisture content guessed at? Some manufacturers buy what they consider to be dry veneers and believe that further re-drying is unnecessary. If this method is followed, the chances are about five to one that there will be trouble from the veneers checking and the joints opening up. This is due entirely to the moisture the stock has absorbed while in transit and while lying in storage.

How much is this costing per year in repairs and loss of customers? On the other hand if the veneers are handled carefully and thoroughly re-dried before laying, what is the cost of this re-drying? If only a small quantity of veneers and crossbanding is used each day, it might be thought that the installation of the veneer re-dryer would not prove profitable. This is not so. Veneer re-dryers of the platen type are now manufactured in any size and can be obtained to suit the requirements of the manufacturer who uses a very small quantity of veneers, and in addition can be made a paying proposition. These machines are now being constructed so that various sections may be added at the demand increases. In the majority of cases the saving of labor alone when a re-dryer is employed will show a considerable return on the amount invested in tthe drying equipment, not taking into consideration the better results obtained through the elimination of checking and blistering of the face veneers.

A glue-room should be a profit producer, and, if this is not the case, a close study of that department should be made. All obsolete methods and equipment should be scrapped and replaced with modern machines and the work carried out along up-to-date lines. If that is done, this department should earn its just share of the dividends.

Drying Thin Veneers

Owing to its thinness the drying of veneers is apparently a simple matter as the necessity of regulating the humidity and temperature so as to prevent the outer surface drying more rapidly than the centre is practically absent. The veneer being thin the heat readily penetrates through and through, making for simple work. Yet the successful drying of this material offers problems of considerable magnitude.

When a kiln is used and the veneers piled with cross strips, on suitable trucks it is usually found that the sheets at the bottom of the pile are badly cracked and checked. The explanation is that the pressure of the upper layers clamps the lower sheets securely between the sticks so that they cannot shrink as the moisture leaves. This may be overcome by building suitable racks in which the sheets of veneer, while separated, will lie loosely, thus allowing for free movement as shrinkage takes place.

This method results in a certain amount of wrinkled stock, and is the only logical method to follow. The same holds true if the stock is piled for air drying. Veneers should never be piled like lumber for checking and cracking will surely follow.

It naturally follows that when the stock is free to shrink it is also free to wrinkle and more or less wrinkling will ensue. Any method that gives freedom to the sheets, whether it is hanging by a corner or standing on edge in facks, will result in curled and warped stock. This may be overcome by piling the stock in tight piles, after drying, to flatten out.

Moisture Content of Wood Independent of Density

Even after long exposure to the same atmospheric conditions, different pieces of wood do not have exactly the same moisture content. Variations of 2 per cent. were recently found in red oak blocks stored under carefully fixed humidity conditions at the Forest Products Laboratory.

These moisture differences, unlike variations in strength, are apparently independent of the density of the pieces. In the laboratory experiments, the variation proved to be as great in blocks of the same density as it was throughout the lot of specimens. Moreover, the range in moisture content was the same in wood of low density as in wood of medium density or high density.

Data on a few representative specimens is given in the accompanying table:

Stage of kiln run in hours	Temperature Degrees F.	Humidity per cent.
1	120	100
6	120	100
12	125	85
24	125	80
36	130	70
48	130	60
60	135	60
72	135	60
84	140	60
96	140	50
108	140	50
120	140	40
144	140	40
156	145	35
168	145	35
180	145	30
192	145	25
Until dry	145	25

What alone can bring to the labor of the world shorter hours? Improved machinery. What alone can bring to labor a greater return for work done? Improved machinery. What, except "hard times," can put commodities within easier reach of the consumer by lessening their cost Improved machinery. What can make up, industrially, for four years of time and 5,000,000 men gone from production forever? Improved machinery. Politics cannot help; wise legislation may help, but the makers of improved machinery, by increasing production, must perform the cure

QUALITY A MATTER OF FAMILY PRIDE FOR —

fifty-two years. In the more than half century during which the business has been run by succeeding generations of the same family, each generation has succeeded to an augmented tradition of quality product and has in turn made every effort to add something to the surety of that quality so that the heritage of family pride which it hands down might be strengthened—not merely stationary. Obviously this has called for more than a never-failing personal supervision of all phases of the business and the adoption of all available improvements in equipment. To fully succeed in living up to the family principle of a constantly improving product it has been necessary to **create** improvements in equipment, in methods and in personnel. The result has been that many of the most striking improvements in the machinery and methods employed in the cutting of high grade hardwood lumber and veneers have come from this plant where fifty years ago the founders of the business invented and installed the first band mill ever used. With the quality of the logs available today every whit as good as those cut fifty years ago, is it any wonder our books have for years carried the majority of the most careful buyers in the country?

Casein Waterproof Glues

By P. M. Stewart, Supt. the Napco Corporation, Indianapolis, Ind.

The wood-working industry owes to the war the general commercializing of waterproof glues. These were known of and used in certain trades for many years before their adaptability to wood-working requirements was emphasized by their extensive use in building airplanes, etc., for the government. These adhesives were tested exhaustedly in the Forest Products Laboratory, and the great demand has justified manufacturers in experimenting and making many improvements since the armstice was signed. Waterproof glues are better to-day than ever before and seem destined to play an important part in the work of all kinds of wood-working plants.

These glues are of two general types, the blood albumin and the casein. The expensive hot-plate presses required for the former make its use prohibitive except in a few special cases and it is of little interest to the general wood-worker. Previous to the war, when the blood albumin glues were considered more or less secret propositions, many manufacturers of built-up work possessed expensively acquired formulas—of which they made no practical use. At that time it was known as the Russian Process. Casein glues, on the contrary, are of a nature which adapts them especially for use in both large and small wood-working plants, and are being employed in larger quantities as their various advantages become more generally known.

No heat is required in their mixing or application; the glue, the wood and the glue room may be maintained at a temperature most comfortable for the workmen; there is no danger from the drafts that insure good ventilation, but were fatal to good gluing with animal adhesives, and they are entirely free from obnoxious odors.

Often, in installing casein glue, no change in equipment is necessary, at other times the old mixers and spreaders can be changed to meet requirements at little expense, and sometimes it is advisable to purchase new mixers and spreaders, but even this is easily justified by the gains made and is not an expensive proposition.

Casein glues should be mixed rapidly and thoroughly. Water, at about 85 deg. F., should be placed in the mixer in proportion of about two to one of the glue powder, and the mixer started. Then the glue is added slowly and the mixture is ready for use in about half an hour. The directions of the glue manufacturer should be adhered to in all cases. A chemical reaction which occurs during mixing may lead to the temptation to add more water, but this is not necessary, as the mixture will be of exactly the proper consistency if directions are followed closely.

It is much better to use more glue than is necessary than to make too thin a spread. As experience is acquired in its use it may be possible to cut down the quantity considerably, but this should only be done after ample tests have been made, which show just the proper spread which best fits individual needs. The glue is inexpensive and an ample margin of safety should be preserved if the best results are to be attained.

In earlier experiences with casein glues some manufacturers found that saws were dulled in trimming up the panels, but this trouble may be obviated by trimming soon after the glue has had time to set properly. Setting requires about three hours, after which lapse of time the panels may be safely removed from the retaining clamps. In three or four days after application, the glue becomes so entirely water-resistant that no amount of soaking or even boiling will separate the joint, which is so strong that in tearing apart, the wood fibres will give instead of the glue. The average tensile strength of the glue is 2500 pounds—greater than that of ordinary woods.

It is only a question of time until the wings of airplanes will be made of veneers, the layers attached with casein glue. Rents in the fabrics used on airplane wings have frequently developed into great tears, being responsible for wrecks and the fabrics were highly inflammable, thus adding to the danger. Veneered wing coverings are not only immune from tearing because of the crossing of the grains, but can easily be fireproofed.

However, airplanes represent a very small percentage of the commercial uses of casein glues. They are now being used extensively in the construction of doors, furniture, interior trim, wheels, dashes, tops, etc., and in the construction of automobile bodies of veneers instead of metal. This last is one of the new fields which is being opened and promises to grow to large proportions, the veneer body being much stronger than metal and so much lighter as to make a very appreciable difference in the life of tires.

Casein glues should be used very carefully when handling thin face veneers of some woods, such as oak or mahogany. If the veneers are to be stained, no particular care is necessary, but the glue, if it penetrates to the face, will cause slight discoloration which will show if natural finish is to be used. If the stains are slight they may be removed with a solution of oxalic acid.

A feature of casein glues that will appeal to both large and small consumers is the ease with which they may be kept, ready for use on short notice. They should be kept in closed retainers in a dry cool place, where the powdered glue will remain in good condition for a long period.

It is not good policy to mix too much of the glue at one time, as it begins to thicken about five hours after being mixed. The glue left over may be mixed with a new batch the next day, but it is better to mix only the amount required for immediate use. Should the amount required be underestimated, it is only a matter of a few minutes and little trouble to mix a new batch.

Owing to the fact that it can be kept on hand, ready for use at any time and in any quantity, and that it may be applied with either the mechanical spreader or brushed on by hand, casein glue is destined to become a practical necessity in every wood-working shop, and new fields will be constantly opened for its use. There are thousands of articles with glue joints that will be better for being waterproof and it is only a question of time until the public will demand this quality in much that it purchases, so, even where other adhesives are generally employed, it will pay to have some of the casein glue on hand and know how to use it to the best advantage.

Piano makers are using casein glue on their ham-

mer felts and player actions. In much of the South American trade, which is almost sure to develop to large proportions in the near future, waterproofing will be necessary in order to endure humid climates. The same requirements will be necessary for furniture made for our extensive seaboard and for many interior locations, especially in the south.

It has been the endeavor here to make an honest statement of both the bad and good qualities of casein glues, based on some experience, but the good qualities so overbalance the bad and the latter are so easily remedied, that it is a safe prophesy that in the next decade casein glues will be in very general use in the wood-working industry and that they will be an absolute necessity in any shop conducting a general line of manufacture.

Shrinkage of Veneer from Boiled and Steamed Logs

According to present practice, logs which are to be cut into veneer are either steamed or soaked in hot or boiling water for several hours to soften the wood. The claim is sometimes made that the veneer from boiled logs is likely to shrink and swell less with changing moisture content than the veneer from steamed logs. This point was made the subject of investigation by the Forest Products Laboratory at a plant using both methods of preparing the logs.

Thirty sheets of ½-inch rotary-cut birch veneer, 60 inches square, were selected from about six logs prepared in each way. The sheets were carefully measured, passed through a textile drier, and measured again.

The average moisture content of the boiled veneer and that of the steamed before drying were practically the same, being 64.8 and 65.5 per cent., respectively. The average moisture content for both kinds after passing through the drier was 10 per cent., and the moisture contents of all dried sheets were between 7 and 13 per cent.

The shrinkage caused by drying was found to be the same for both kinds of veneer. When the dried sheets were resoaked, they expanded to their original dimensions, and when subjected to a second drying shrank as uniformly as before.

Although these tests were very crude, the indicate that the shrinkage of veneer from boiled and steamed logs is practically the same. The variation is no greater than is found between pieces from different logs which have undergone the same treatment.

A Tip on Matching Veneers

Successfully matching veneers is a good deal like some other things; there is as much in getting properly ready for it as there is in the operation itself—perhaps more.

It isn't such a very difficult task to match the grain on two pieces of veneers that have laid side by side in the flitch and take them, if they are perfectly flat, but if they have wrinkled in drying, that is another story.

Therefore, the first step is to make the veneers lay flat. With just a little preparation this can be easily done, even if the pieces are badly wrinkled. Of course, if there is much of the work being done, the best thing is to install a plate redrier.

First heat some softwood cauls pretty warm. If the veneers are moist they can be placed between the boards at once, which will straighten them out. The softwood will absorb the moisture while the heat irons the veneers straight and holds them that way until they are set. Some pressure is necessary.

When the veneers are thoroughly dry and straight, they may be jointed, the edges held firmly together and taped. Where hand-taping is practiced, the veneers are generally matched on a flat table or bench and the pieces held in place by tacking lightly to the bench until the tape is applied.

Coating That Prevents End Checking

Wood, whether in the form of logs, lumber, timber, shaped blanks, or veneer, will split and check at the ends during seasoning, if drying is allowed to go on at a natural rate through the end grain. To retard the rate of drying from the ends, it is necessary to cover them with some protective coating.

The law of end coatings, in simple terms, is that the harder and greener the wood, the more effective must be the coating. In its experiments to determine the practicability of various coatings and end dips, the Forest Products Laboratory found the following to be true:

Paint is convenient to handle, but is of low effectiveness.

White lead is convenient to handle, and is of medium effectiveness.

Lorac, a commercial compound, is convenient to handle, and is of considerable effectiveness.

Rosin-lampblack is inconvenient to handle, but of high effectiveness.

Rosin-lampblack is made according to the following formula:

Clear grade rosin	60 parts by weight
Lampblack	1 part by weight

The rosin should be melted but not allowed to boil or froth. The lampblack should then be thoroughly stirred in. The ends of the sticks should be dipped in this molten mixture to a distance of about ½ in. When hard, the coating should be smooth, free from bubbles, shiny, and an eighth of an inch thick over the end.

If the stock is to be subjected to rough handling which might cause the coating to chip when cool, linseed oil may be added, in the proportion of 1 to 15 by weight, but this will have a tendency to make the coating excessively soft in the kiln at temperatures above 103 deg F.

Convenient Wall-Pad Calendar

The Picknel Walnut Co., St. Louis, Mo., have issued a very useful wall calander. It is of the pad form, with numerals three inches high. The picture shows a portion of their log storage pond and gives an idea of the immense quantity of raw material that this firm carries.

Efficiency and greater production, thrift and economy are the characteristics, both national and individual, which will re-establish Canadian industry on a sound peace footing.

Don't fall over a lot of waste pieces; have a boy to clear up the mill. The cost will be recovered by the increased production.

Certus Glue Manufacturing Co.

Manufacturers of Waterproof Glue in Powdered Form

Successors to

CERTUS COLD GLUE COMPANY

Detroit, Michigan

We Wish to Announce to the Trade

that we have purchased the assets of the Certus Cold Glue Company (Bankrupt), and have organized the CERTUS GLUE MANUFACTURING COMPANY for the purpose of continuing the manufacture and sale of CERTUS Glue.

We are now the largest manufacturers of Casein Waterproof Glues in the World, and our plant at 88 Isabella Avenue, Detroit, Michigan, has a daily capacity of 80,000 lbs.

The following varieties of HIGHEST GRADE WATERPROOF GLUES IN POWDER FORM are manufactured by us:—

CERTUS VENEER

Specially suitable for Veneer purposes.

CERTUS JOINT

Specially suitable for Pattern, Joint, and Cabinet Work and all Automobile Work.

We are in a position to offer the above varieties in large or small quantities for immediate delivery. We guarantee our products to give full satisfaction; all our sales are made upon that understanding.

We invite inquiries from the trade, and will furnish price lists; also quotations on yearly requirements. Our prices are the lowest and our quality is the highest.

We are prepared to demonstrate the superiority of our product, and are glad to send samples with literature and any information desired.

We shall at all times specially feature LOW PRICE; HIGH QUALITY AND SERVICE. All communications should be addressed to:—

Certus Glue Manufacturing Company

88 Isabella Avenue - DETROIT, MICHIGAN

Information and Inquiries

You are cordially invited to make use of this department

Designs for Head Casings

Apple Hill, Ont., Feb. 2, 1920

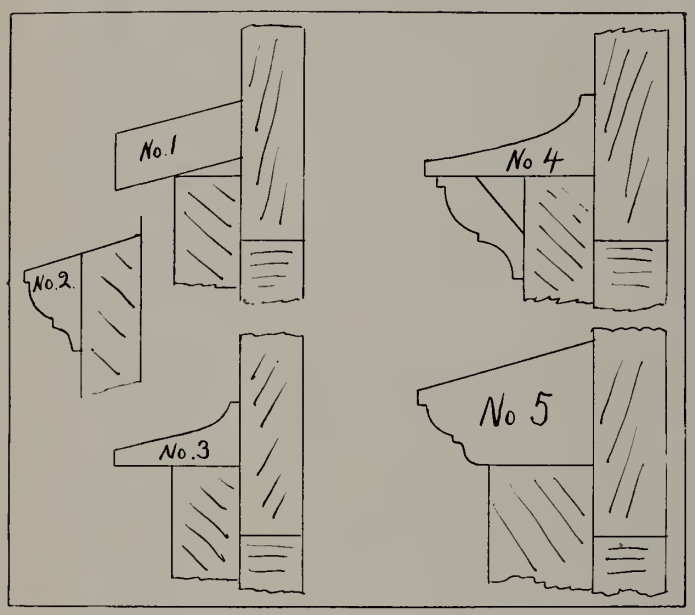
Editor "Canadian Woodworker:"

Will you kindly give me a few designs for outside head casings for door and window frames, where shingles or clap-boards are used.

Yours truly,

A. D. Clingen.

The accompanying sketches outline a few designs. These can be changed or adapted to the moldings you have in stock, as required. Better results will be secured in every case if a metal flashing is used. The first illustration shows a very plain form of drip cap. Sometimes when this is employed the top edge of



A number of simple head casing designs

the outside casing is bevelled to suit. The next sketch, No. 2, shows a plain moulding planted on the top edge of the casing. In this case it is necessary that the top be bevelled also that flashing be used. The third drawing is of a plain moulded drip cap. A small moulding such as cove or quarter round could be placed under this if desired. No. 4 is the same idea only on a larger scale. This may be worked out in a variety of forms depending entirely on the different designs of mouldings used. The last sketch shows a form of one piece drip cap that is often used with 1⅜ in. casing. It is run from 1½ x 1¾ in. stock and may be moulded to suit the knives on hand.

Parts Wanted for Deck Chairs

A large manufacturing firm in London, England, is in the market for a quantity of parts for deck chairs, cut to specifications, and is desirous of getting in touch with some Canadian firm who are in a position to handle this business. The name of this firm may be secured from the publishers of this paper.

Clothes Pin and Handle Machinery

Nelson, B. C., Jan. 31, 1920

Editor "Canadian Woodworker:"

Would you kindly inform us where we can obtain the equipment used in the manufacture of clothes pins. Perhaps you could refer us to the manufacturers of suitable machines. In addition we would like to know where we can secure a lathe for turning out broom handles.

Yours truly,

T. H. Waters Co.

Would suggest that you get in touch with some of the machine and supply houses whose advertisements will be found in this issue, and if they do not have any suitable equipment in stock they could get the necessary machines for you. We believe that the H. W. Petrie, Limited, Toronto, have a number of second hand automatic clothes pin lathes and slotters in stock. The Humphrey Mfg. Co., Keene, N. H., and Goodspeed Machinery Co., Winchendon, Mass., are manufacturers of clothes pin machinery. Broom handle lathes are made by the Defiance Machine Works, Defiance, Ohio, and the Trevor Mfg. Co., Lockport, N. Y. J. M. Nash, Milwaukee, Wis., makes a line of broom handle sanding machines.

Plates for Graining Machine

St. Rose, P.Q., Feb. 5, 1920

Editor "Canadian Woodworker:"

Can you inform me where I can purchase, in Canada, a rubber plate for graining coffins, the same as used by other coffin manufacturers.

Yours truly.

H. Cyr.

This work is done on a graining machine and the machine and plates can be secured from Hugh Silver & Son, Prescott, Ontario, and Ogdensburg, N. Y. The Grand Rapids Panel Co., Grand Rapids, Mich., also make a line of graining machines. No doubt either one of these firms could supply your needs.

Value of Aluminium Cauls

Montreal, P.Q., Feb. 4, 1920

Editor "Canadian Woodworker:"

Was wondering if you could give me any information pertaining to the use of aluminium cauls. We do a lot of veneer work and at present are using heavy wood cauls.

Yours truly,

A. E. Dupias.

Aluminium cauls are being used in many up-to-date plants and are giving good satisfaction. Owing to the difference in thickness the use of a metal caul, such as aluminium, increases the capacity of the press and retainers as a greater number of pieces may be put in. Aluminium is a good heat conductor and seems to retain its heat longer than other metals. The smooth surface ensures a good face on the panels produced and in addition glue does not stick readily so that an aluminium caul is easy to keep clean. Other kinds of metal are often used but owing to its extreme lightness and heat retaining qualities aluminium seems to be the favorite.

The automatic screwdriver saves a great deal of tedious and laborious work.

We Are Doing Everything Possible To Meet Demand
Supply and demand for hardwoods are equally beyond human control. The causes are obvious to the experienced. May we state though that while even our vast organization has fallen short of complete success in meeting the issue, we are doing everything humanly possible to speed up; we are even enlarging our facilities in order to more fully live up to our reputation as
Exponents of the Golden Rule in Business.
Anderson-Tully Co.

News of the Trade

Poirer & Morin were recently registered in Montreal, P.Q., as upholsterers.

Alp. Baril, Shawinigan Falls, P.Q., is erecting a new sash and door factory.

The plant of the Quebec Heel Co., Quebec, Que., was recently destroyed by fire. Loss $10,000.

The Ontario Spring Bed Co., London, Ont., are building an addition to their plant. Cost $10,000.

The furniture factory of Dombrowski Bros., Limited, Quebec, P.Q., was recently damaged by fire. Loss $2,000.

A defective motor caused a small blaze in the plant of the Toronto Bedding Co., Toronto, Ont. Damage $500.

The P .D. Ivey Co., London, Ont., manufacturers of storage batteries, have taken over the P. W. Ellis munition plant.

The Sidney Mills Ltd., Sidney, B.C., manufacturers of boxes, lumber, etc., are installing a 200 h.p. engine in their planing mill.

The Kelsey Wheel Co , Ltd., Windsor, Ont., are making two additions to their factory, one 63 x 60 and the other 67 x 60; cost $18,000.

A. H. Gould, St. Marys, Ont., has installed his planing mill equipment in the Chalmers warehouse building which he recently purchased.

The Laidlaw Bale-Tie Co., Limited, Hamilton, Ont., manufacturers of tying wires, nails, etc., are building an addition to their factory.

Robin Freres, 135 Carrier Road, Montreal, are erecting a two-storey factory, 55 x 74. This will be fitted up for the manufacture of shoe lasts.

G. F. Payne, who recently built a sawmill on Saturna Island, B.C., plans on equipping a planing mill, to be operated in conjunction with this mill.

The furniture factory of A. Abrahamson, 605 Dufferin Ave., Winnipeg, was destroyed by fire. The loss of $1,800 was partially covered by insurance.

Stuart Bros., Hyde Park Ave., Hamilton, Ont., are building an addition to their planing mill and are in the market for a horizontal boring machine for doors.

Roxton Mill & Chair Mfg. Co., Ltd., Waterloo, P.Q., who were contemplating building an addition to their plant, have decided to hold this project over until 1921.

The Stratford Manufacturing Co., Limited, Stratford, Ont., are doing quite an export business. Shipments were made recently to England, Ireland and South Africa.

The Canadian Western Woodworkers, Limited, Victoria, B. C., recently added a finishing room to their plant and also installed a C. M. C. two-drum sander and a C. M. C. dovetail machine.

A company known as the Coast Box Company has purchased the site at Marpole, B.C., formerly occupied by an evaporating plant, and will shortly commence the erection of a box factory.

A recent announcement by Yarrow's Ltd., Esquimalt, B. C., states that they are prepared to proceed with the manufacture of aeroplanes as soon as the demand is sufficient to warrant this move.

S. C. Johnson & Son, of Rachine, Wis., have purchased a plant in Brantford, Ont., where they will manufacture their line of prepared waxes and wood stains. A new factory is contemplated for next spring.

An extra provincial license has been granted the Canadian Fabrikoid Ltd., Toronto, with a federal charter, to carry on business in the Province of Ontario and expend the sum of $1,500,000 for that purpose.

Rhodes & Mavor, Thessalon, Ont., have taken over the building known as the old woollen mill, and are equipping it with modern woodworking machinery for the production of shingles, boxes and other wood products.

Ives Bedding Co., Ltd., Cornwall, Ont., have been incorporated to manufacture and deal in beds, bedding and furniture and to take over as a going concern the Ives Modern Bedstead Co., Ltd., of Cornwall. Capital $750,000.

Bouvier Limitee, Montreal, P.Q., has been incorporated to manufacture and deal in pianos, phonographs and all forms of musical instruments. Capital $49,900. V. P. Bouvier and G. Vezina, of Montreal, are two of the incorporators.

B. & B. Furniture Co., Ltd., Kitchener, Ont., have been incorporated to manufacture and deal in furniture and other wood products. P. Bogdonovitz and P. L. Kroetsch, both of Kitchener, are two of the incorporators. Capital $50,000.

The Morris Pianos, Limited, Listowel, Ont., have been incorporated to manufacture and deal in pianos, phonographs and all kinds of musical instruments. Capital $150,000. This firm recently acquired the Listowel plant of the Karn-Morris Piano Co.

The Lloyd Manufacturing Co., Menominee, Mich., manufacturers of machine woven fibre baby carriages and furniture, are looking for a suitable location for a Canadian factory. It is understood that several plants are under consideration.

David & Michaud, Limited, Montreal, P.Q., have been incorporated to manufacture and deal in pianos, phonographs and other musical instruments and to take over the business, in Montreal, known as David, Michaud & Cie. Capital $49,000.

The Disappearing Propeller Boat Co., Limited, Toronto, have recently completed an addition to their Port Carling plant and have added the following equipment: planer, shaper and sander. The production for 1920 is estimated at 1,000 boats.

Dominion Shipbuilding & Repair Co., Ltd., Toronto, Ont., have been granted a Dominion charter to build or repair boats and vessels of all kinds. Capital $3,000,000. N. S. Robertson and H. L. Steele, barristers-at-law, Toronto, are among the incorporators.

McCall & Co., St. Williams, Ont., are erecting an addition to their furniture factory. The following equipment is being installed: Jackson-Cochrane automatic glue jointer, Cowan band saw, Cowan cut-off saw, four-spindle vertical borer, rip-saw, jointer and resaw.

Globe Shipping Corporation, Limited, Montreal, P.Q., have been incorporated to build or repair steamships, tugs, sailing vessels, barges and boats of all kinds. Capital $1,000,000. L. MacFarlane, K.C., and W. B. Scott, advocates, of Montreal, are among the incorporators.

L. N. Godfrey, Ltd., with a capital stock of $100,000, and headquarters in Montreal, has been granted a federal charter to manufacture and deal in furniture, doors, sashes, blinds, etc. L. Joron, U. Joron and G. H. Seguin, advocates, of Montreal, are among the incorporators.

The De Luxe Upholstering Co., Limited, Kitchener, Ont., were recently incorporated to manufacture and deal in furniture and upholstered goods and to take over the business known as the De Luxe Uuholstering Co. Capital $20,000. The incorporators are A. G. Schreiter, A. A. Schreiter, and H. C. Schreiter.

The Pannill Door Co., which was recently registered in Toronto, Ont., has been organized to deal in doors exclusively. They have a stock of several thousand doors of all sizes, including doors in plain and quarter cut white oak, red oak, birch and white pine. Capt. Hunter Pannill and Major E. I. Harrington are the prime movers.

The North American Bent Chair Co., Limited, Owen Sound, Ont., recently shipped the following large orders, 400 dozen chairs to Calcutta, India, and 200 dozen to Buenos Aires, South America. Before the war this progressive firm enjoyed practically a world-wide trade and the prospects for renewing this business are very bright.

The Forster Motor Car & Mfg. Co., Ltd., Montreal, P. Q., have been incorporated to manufacture and deal in motor cars, aeroplanes and vehicles of all kinds and also to carry on business as manufacturers of motor and truck bodies. Capital $1,000,000. T. R. Sloan and S. H. Slater, solicitors, both of Hamilton, Ont., are among the incorporators.

The Restmore Mfg. Co., Ltd., Vancouver, B.C., manufacturers of furniture, mattresses, etc., have installed a sawmill and in future all lumber used in the manufacture of their line will be cut on the premises. The logs will be brought to the plant by rail, and it is anticipated that a considerable saving will be effected both in time and money.

A rather serious fire destroyed the plant of the Blain Carriage Works, Montreal, P.Q. The blaze started in the finishing room and made such rapid headway that three of

the workmen were cut off and burned to death, while a number of others were seriously injured. The amount of the loss and the cause of the fire have not as yet been ascertained.

The Thomas Organ & Piano Co., Ltd., Woodstock, Ont., have sent an attractive card to the trade announcing their recent incorporation. The personnel of the new company is the same as that of the old, the following being the officers:—James Dunlop, president; John G. Dunlop, vice-president; Wm. H. Dunlop, director; Harry Sykes, secretary-treasurer.

The plant of the Hope Manufacturing Co., Limited, Toronto, Ont., was completely destroyed by fire recently. The damage, which amounts to $45,000, was only partially covered by insurance. This company have been manufacturing sash, doors, etc., since 1912. Some twenty-five men are thrown out of employment by this fire. The company intends rebuilding.

Hamilton Wood Products Co., Ltd., with a capital stock of $30,000 and headquarters in Hamilton, has been incorporated. Wide authority is conferred upon the company, which is empowered to manufacture, buy, sell and deal in wares and merchandise of all kinds. Among the incorporators are Edgar Brimmer, Wm. B. Ireland, Milton Ireland, Arthur Wilson and others, of Hamilton.

The Kent Lumber Co., Granby, P.Q., are erecting a sash and door factory and planing mill, 38 x 80. The equipment, which is electrically driven, includes a full line of sash and door machinery in addition to planers, moulders and a matcher. A shavings exhaust system is also being installed. About 20 men will be given employment, and the plant is expected to be in operation February 1st.

Gordon G. Scott, who operates woodworking plants at Upper Cross Creek and Westfield, N.B., has applied to the City Council of Fredericton for a twenty-one years' lease of the Estey Mill site. Mr. Scott promised an expenditure of not less than $25,000 for machinery and equipment and estimated that his payroll would be not less than $15,000 a year. The council have the proposition under consideration.

McFarlane Mfg. Co., Ltd., 160 River St., Toronto, manufacturers of woodenware, ladders, etc., have purchased the property of the York Lumber Co., Toronto. This property includes a large planing mill, and it is the intention of the McFarlane Co. to move their plant from River St. and install it in the new planing mill building. It is anticipated that the plant will be in operation at the new location not later than March 1st.

Wm. Robertson, Toronto, B. C. Lumber Commissioner for Eastern Canada, is moving his offices from the Kent Building to No. 1 Adelaide St. East, where he has secured larger and more commodious quarters on the ground floor. The interior of the offices is being finished with specimens of the different B. C. woods, and when finished will be very attractive. A permanent display of B. C. forest products will be made and should prove of interest to all users of wood.

J. E. Asam, who formerly operated a basket factory at Rydal Bank, Ont., is moving his plant to Thessalon, where he is constructing a two-storey factory 40 x 60. Among the equipment to be installed is a 90-in. veneer lathe. Mr. Asam will continue to manufacture his line of patent blueberry baskets, in addition to supplying material for board bottom or Climax baskets. When his sawmill is in operation he will be able to cater to the demand for broom and brush handle blanks.

Mobbs & Lewis, who are establishing a last factory at Mavis Mills, N.B., P. O. address Cross Creek, N.B., have made good progress with their operations. A site of twelve acres has been cleared and the sawmill and last factory, with all necessary camp building, has been erected. Logging operations have yielded sufficient timber for 1,000,000 lasts and 750,000 feet of hardwood, and next season they expect to cut 2,000,000 lasts and 2,000,000 feet of birch lumber. R. W. Baird is the manager.

W. N. Manning, of the Sherlock-Manning Co., London, Ont., has formally taken over the business and plant of the Doherty Pianos Ltd., Clinton, Ont., which has been acquired by this firm. The business will be conducted under the old name of Doherty Pianos Ltd., and will be run independently of the London factory. In a short talk to the employees of the new plant, Mr. Manning stated that he hoped to add to the staff from time to time and to increase the output to 2400 pianos a year. B. J. Gibbings will continue as superintendent.

At the annual convention of the Western Retail Lumbermen's Association, which was recently held in Winnipeg, Walter Thorn, the retiring president, in his address stated that based on the requirements of the United States, he believed that Canada will need 100,000 homes, 30,000 factories, 1,000 schools, 3,700 apartment blocks, 1,400 churches, 1,000 freight sheds, 30,000 barns, besides many small buildings. The enormous quantity of millwork for this large amount of building augurs well for the immediate future of the woodworking industry. The furniture manufacturers will be called on to do their part by turning out sufficient furniture for this possible program.

The Harris Wood Products Ltd., Toronto, Ont., who were recently incorporated with a capital of $100,000, have secured the Graydon Mill plant at Streetsville, Ont., and are fitting it up to manufacture a line of sectional houses for domestic and export trade. The site consists of 6½ acres, and when the improvements to the plant are completed, they will have about 9,000 feet of floor space. The following equipment is being added:—Cowan 12-in. moulder, Cowan power feed rip saw, Jackson-Cochrane buzz planer, Cowan swing cut-off, Cowan drum sander, two Morgan nailing machines, sash relisher, tenoning machine. Orders for houses already secured include a $50,000 export order and one order amounting to $25,000 for domestic trade.

Simmons, Limited, Montreal, P.Q., who were recently incorporated with a capital of $10,000,000, have taken over the J. H. Sherrard Mfg. Co., Limited, Montreal, P.Q., and allied companies. In future in addition to the company named the following affiliated firms will operate as Simmons, Limited: The Ideal Bedding Co., Limited, Toronto; the Alaska Bedding Co., Limited, Winnipeg; the Alaska Western Bedding Co., Limited, Calgary, and the Alaska B. C. Bedding Co., Limited, Vancouver. The management will remain as at present with J. H. Sherrard, Montreal, president; Mr. Bradshaw, vice-president. The managers are: Mr. Browne, Toronto; Mr. Abbott, Montreal; Mr. Bromley, Calgary; Mr. Baker, Winnipeg, and Mr. McLaren, Vancouver, B.C.

Personal

Mr. Givens, of the Export Association of Canada, whose headquarters are in Montreal, was in Toronto recently on a business trip.

V. J. McLellan, of the Sellers Kitchen Cabinet Co., Limited, Southampton, Ont., returned recently from a business trip through Michigan.

James L. Fralick recently passed away in Vancouver, B.C. Mr. Fralick operated a carriage factory in Picton, Ont., for a great many years.

E. B. Palmer, Toronto, Ont., the energetic representative of the Standard Paint & Varnish Co., Windsor, Ont., has been laid up with a slight attack of flu.

Wm. Cawkell, Toronto, secretary of the Furniture Manufacturers' Association, is at his desk again after having been confined to his home with a slight attack of flu.

H. Bruce Beattie has resigned his position with the National Table Co., Limited, Owen Sound, Ont., to take charge of the Kitchener factory of the Canada Furniture Manufacturers, Limited, Woodstock, Ont. Mr. Beattie will carry with him the best wishes of his many friends.

John C. Barr, Granby, P.Q., recently passed away. Mr. Barr was an active partner in the Granby Carriage Co., in fact, in 1902, he helped organize this company. He took a great interest in civic affairs, having served on the Council for the past twenty years. His demise will be regretted by a wide circle of friends.

W. T. Gibbard, founder of the Gibbard Furniture Co., Ltd., Napanee, Ont., died recently in that town. With the passing of Mr. Gibbard, who was 75 years of age, the furniture industry of Canada loses one of its oldest members. In 1862 Mr. Gibbard was taken into partnership with his father, who previously had been making a line of furniture, and the business was changed to J. Gibbard & Son. In 1891 the present firm of The Gibbard Furniture Co., Limited, was formed, and W. T. Gibbard was appointed manager. He held this position until 1909, when he retired and was succeeded by his son, G. W. Gibbard. Mr. Gibbard was of a kindly and genial nature and will be greatly missed by numerous friends in the furniture industry.

The Lumber Market

Domestic Woods

At the present writing there is an unprecedented demand for all kinds of Canadian woods. In many lines there is an acute shortage, in fact some lines like pine, hemlock and birch are almost off the market, and in all woods and grades the stocks are short and broken. At the same time the demand continues strong without showing any signs of letting up. There is not any relief in sight at present.

In another month or two the new stock will be on the market but such is the demand that as near as one can judge it will afford very little relief. Pine and hemlock are being sought after assiduously with the result that they are scarce and hard to secure. The same applies to spruce. Not only are the box manufacturers buying large quantities but other trades are buying it as well. Prices are very high and still advancing. The future is difficult to predict but there is a limit over which prices cannot advance and many think that it will be reached very shortly. Many lumbermen are of the opinion that the softwood cut this season will be about the same as last year. If that is true the present shortage will probably continue during 1920 unless the demand eases off.

The hardwood market is in about the same condition. American buyers, chiefly for automobile concerns, are in the field and are taking practically all the lumber offered. This tends to force up local prices with the result that quotations are increasing all along the line. Not only is there a strong demand from the south of the border but local woodworkers are buying what they can. The high exchange rate places the Canadian buyer at a disadvantage for at present rates of exchange lumber stocks will realize about 15 per cent. more than if sold in Canada. That works to the detriment of the local buyer as he must virtually pay the exchange on his local purchases. Stocks in all kinds of hardwoods such as birch, maple, beech and elm are very low. The snow enabled a small amount to be brought out from inland mills but these stocks were picked up very quickly. There does not seem to be any relief in sight until the winter cut is placed on the market in Many and June. This cut is likely to be greater than for the last few years but as the demand is abnormal it is hard to judge just what effect it will have on the market. Prices are extremely high and give indications of going high, as an instance an order was recently placed for 200 M. ft. 8/4 birch at $140 shipped green. A heavy cut in the Southern hardwood districts would have its effect on the local market as it would tend to take care of the American demands. Lately conditions in this field have been unfavorable to increased production. To sum up all local woods are scarce and hard to secure, the demand continues extremely strong, prices are very high and may go higher with little or no relief in sight.

Imported Woods

The consumers and manufacturers of the various American hardwoods are facing a very difficult situation. Stocks of all kinds are low, lower than is usual for this time of year, while the demand continues very strong. Prices have advanced rapidly during the last few months, one large wholesaler stating that, on a general average he thinks that hardwoods have increased about $1 per day for the last ninety days. Has the limit been reached? Certainly there is a marked tendency to substitute and utilize cheaper hardwoods with the result that these have advanced in price until to-day birch and other common woods have reached the figure that quartered white oak stood at a short while ago. Whether this increased demand for the cheaper stocks will tend to stabilize present prices on the cabinet woods remains to be seen. Production in Southern hardwood districts is being hampered by wet weather and floods. This all curtails production. It is this small production or lack of production that is responsible to a large degree for present prices and conditions. Demand is to a certain extent relative and if the amount produced were greater the present demand would not be considered so high. Then again there is the possibility that frantic enquiries being sent to a number of manufacturers at the same time and an effort by many to cover for a considerable period ahead have created a fictitious demand. While the stocks of many manufacturers are low and perhaps broken, the lumber consumer who buys from several firms can usually have his wants attended to by some one firm, if he will but pay the price. It is to a large extent a question of price. One large dealer stated recently that the stock held by his firm was as large and complete at the present time as at the corresponding period last year and that, offhand, he did not know of any items that could not be supplied but his prices were the same as others. It is a situation calling for cool, calm judgment on the part of the lumber buyer. Any attempts to buy large quantities and cover for a long period ahead, would tend to further decrease stocks and strengthen the present upward price tendencies. A level must soon be reached where prices and conditions will to a certain extent be stabilized and the attitude of the lumber buyer will go a long way toward determining when that condition will be reached.

Gayoso Lumber Company to Install Mill at Grenada, Miss.

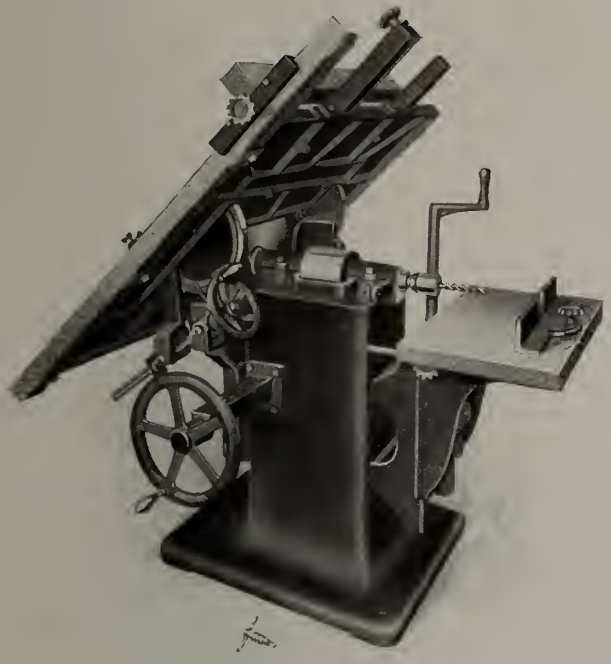
The Gayoso Lumber Company, of Memphis has just closed a deal with W. B. Hoffa of Grenada, Miss., for his timber holdings in Grenada County. This purchase, together with timber land already owned by the Gayoso Lumber Company, brings their holdings in Grenada County up to over eight thousand acres, and this tract is considered to be one of the most heavily timbered white oak properties in the state of Mississippi.

W. A. & C. R. Ransom of the Gayoso Lumber Company, state that their company have acquired a very desirable mill site in Grenada, and that they contemplate installing this fall the latest improved nine-foot band mill with resaw. The investment including timber holdings, trackage, log roads, timber camps and mill, etc., will be over three quarter million dollars.

With this mill in operation the Gayoso Co. will have three plants with a total combined output of 150,000 feet of hardwoods per day.

An emery wheel which gums the teeth and leaves them case hardened should be dressed so that it cuts cleanly and well.

An Excellent Machine for Furniture and Cabinet Work



The "Famous" No. 16 Variety Saw Bench with boring and mortising attachment will do much to increase your output in your furniture and cabinet shops. Accuracy is a main factor in its operation, while the roughest class of work is handled with the same degree of efficiency.

Write us for further information regarding the "Famous" No. 16 Variety Saw Bench and many other machines that you may need and are included in our complete line of woodworking machinery.

What Costs Mean to You

The practical object of business is production—measured in profits. Production without profits avails nothing and sooner or later ends in disaster.

The intelligent production of anything must be gauged—as the production of steam and electricity is governed and controlled by the various meters used. The gauge of production is costs. Too much production without knowing your costs is liable to be as disastrous as issuing too many checks without knowing your bank balance.

For most effective and intelligent control of production—and therefore greatest profits, cost and production methods are inter-related and inseparable. There would be no need of costs without production while production without costs is like driving at night without lights. You may proceed without mishap, but the chances are against you.

Every progressive firm must have both cost control and production control methods and these methods should be operated with the greatest possible economy. To do so it is quite evident that the mechanism for gathering costs and controlling production should be thoroughly co-ordinated.

Reducing Maintenance Costs

How often do we find in timber and woodworking shops an accurate account kept of power maintenance costs? Yet a careful analysis of such a record would, it is thought, come as a revelation to many firms.

A regular system of maintenance possesses a twofold value. In the first place, it enables the plant to be maintained at its highest efficienty, and in the second place, it goes a long way towards avoiding a serious breakdown—and a serious breakdown generally occurs at the most inconvenient moment.

As an illustration of the value of regular maintenance, assume that a certain machine is belt-driven from a line shaft, and that the belt, being out of condition—glazed, hard, or slack—is slipping, and so reducing the revolutions of this machine 10 per cent. below normal. This, in effect, is equivalent to a reduction in output of 10 per cent. Assume further that the mill or the factory contains 100 machines, and that 20 of them have their driving belts in a similar condition. This means that the total output of the factory has been reduced by 20 per cent.

The remedy is simple. It is only a matter of organizing a maintenance system, or an official whose duty it would be to regularly inspect and maintain the whole of the power plant. Arm such an individual with authority, a speed indicator and a stop-watch, and he should have no difficulty in cutting down power transmission losses and in keeping the various machines up to their full duty. The result would be higher output and a considerable reduction of maintenance costs.

Profit-Sharing a Remedy for Present Inefficiency of Labor

Our high scale of wages, while it is, to some extent, a handicap in procuring export trade, is not the real obstacle to the development of Canadian industry. The difficulty which is preventing us from taking full advantage of the present unprecedented opportunity for placing Canadian products on the markets of the world, is labor inefficiency. Men whose earnings have increased approximately 100 per cent. are, in many cases, less than 75 per cent. as efficient as they were in the days of low wages before the war. But the wage scale is a secondary consideration. Even higher wages than are being paid at present would be quite practicable, if efficient service was given in return. Unfortunately, the rule seems to be: The higher the wage, the lower the efficiency.

How is this condition to be remedied? We believe that profit-sharing, or bonus payment on the basis of production, is the only way under present conditions, by which the situation can be improved. Hard times would tend towards labor efficiency, for the fear of unemployment is a great incentive to work. But it is not desirable that that incentive should exist and we must substitute it with another—the incentive for gain. If the worker's financial interests are directly affected by his efficiency, he is going to become more efficient. There is no industry to which some sort of profit-sharing, or bonus-payment, scheme is not applicable, and the supreme need of the country at the moment is a new motive force amongst the workers, such as the adoption of a new system of wage payment along these lines would create.

Reducing Breakage in Bending

If those among you who do bent work are having trouble with breakage, that is, if good stock is breaking and going to waste, try steaming it longer. One shortcoming in steaming, as in kiln drying, is that of trying to rush the work. Wood absorbs heat and moisture very slowly, and, while a little pressure may help some, it will not take the place of more time. Steaming it longer is the best answer. This will not make knots and cross grain stock bend without breaking, but it will reduce the breakage in good stock.

NAPCO WATERPROOF GLUE

No wastage

Applied cold—and mixed cold

Profitable in its saving

Consistent in all grades of work

Odorless in the glue room

NAPCO is absolutely uniform. It eliminates waste, is easily applied, is impervious to water, and never lets go.

NAPCO joints are as strong as the wood.

H. LEFEBER

Lewis Building, Montreal, Que.

SOLE AGENT FOR CANADA

Vegetable Glues

Do you know that VEGETABLE GLUES may be made in all the varying qualities found in ANIMAL GLUES, such as HIDE GLUE, BONE GLUE, GELATINE, etc., each class having its special and widely different qualities according to the purpose for which it is to be used?

If, therefore, you are interested in the question of the use of ANIMAL or VEGETABLE GLUES, of any kind in industrial work, we ask you to communicate with us, advise us of your exact wants, both in the matter of character of work and cost limits, and we will supply you with JUST WHAT YOU WANT.

Remember that there is NOT ONLY ONE quality of vegetable glue, but just as many grades as in animal glue, and that the selection and use of a vegetable glue requires the same care and knowledge as the use of an animal glue.

Only with a knowledge of this fact can you secure the ideal product for your line of work, or reduce its cost to a minimum.

Let us have your inquiry, if interested in the subject, and an opportunity to PROVE TO YOU that we can serve you to better advantage to yourselves both in the matter of cost and excellence of work turned out, than any one else now engaged in this field of research and application.

We only ask your inquiry and an opportunity, AT OUR EXPENSE AND COST, to demonstrate to you that we understand our business in every detail and can make it to your interest to deal with us.

We operate under our own patents and guarantee full protection to all users of our Glues.

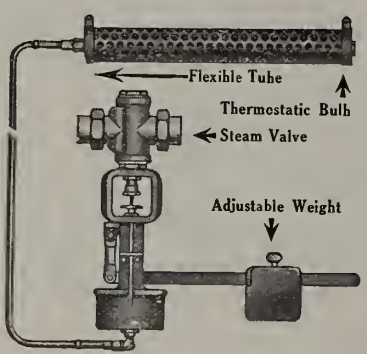
The Better Way of Controlling Kiln Temperature

The world wants finished products now. All costs are rising and your problem is to produce more. Begin by insuring your wood as it goes into the kiln. Every inch of green wood has cost you real money and represents two values—raw value and finished value. Don't allow fluctuating kiln temperature to tamper with these values. Prevent fluctuating temperatures by equipping your kilns with

Powers Heat Regulators

As long as steam pressure is maintained Powers Regulators operate. Their operation insures correct kiln temperatures, saving of fuel by using only necessary heat, saving of labor by releasing men from watching thermometers and



The Powers Regulator No. 15

Specially designed to control temperature in dry kilns, ovens, varnish and dry rooms, etc. Requires no outside power for its operation.

valves, saving of material by cutting down the loss from case hardening, warping, and checking. They also speed up the drying by fully 25 per cent.

During our more than thirty years of experience in automatic temperature control we have gathered some very profitable information for the woodworking industry. Let us show you how to save money on your kilns or other apparatus where heat is a factor. We are cheerfully at your service. Write us today.

INDEX TO ILLUSTRATIONS
in the New Book
Machine Molder Practice

You can get some idea of the completeness and value in this book by reading the subjects illustrated therein.

Plan and side-view of molder in proper alignment. A square slotted cutterhead fitted with ordinary straight surfacing knives. Solid and sectional knives. Patterns with thin edges worked with top head. Showing how sectional cutters should he arranged. A few different types of knives. Balancing knives set in staggered fashion. Thin high-speed steel knives attached to square head, with caps and bolts. How to use the molder or "stickerman's" rule. Another method of setting knives correctly. Moldings on which undercutting is necessary. Attachment for working Byrkit lath, at rear end of an inside molder. A square self-centering side head fitted with thin knives and caps. Making half-round bushings, for pulleys. Trough in which piano fall boards are run. Cross-section of a front fall board. Making plain tapered staves in one operation. Showing how staves for tapered columns are laid out. Stave in position alongside form. Method of laying out sprung crown molding for circular porches or towers. Arrangement of guides for running circle work. Molding segment and circle work on edge. Arrangement of knives and guides for running molding face down. Three methods of fitting up knives for planing without tearing cross-grain. Another way to fit up surfacing knives for working cross-grain. Special knives for cutting the edge of rabbetts. Methods of fitting up rabbetting knives to make non-tearing cut. Special grooving cutter. Reinforcing a wide knife. Four different kinds of side braces. Two ways to brace extra long knives. Four types of "scoop" knives for making gutter. Bracing a loop knife with T-bolts and steel block. Another method of clamping loop knives to a square cutterhead. Making ogee gutter. Special blocks for enlarging square heads. Hooks in position to hold projecting ends of long knives. Making moldings in pairs, face down. Center guide in pressure bar. Picture frame moldings made in pairs, face up. Four types of practical splitting cutters. Special high-speed steel splitting cutter and holder. Saving an extra molding by under-cutting. Combination head for splitting and planing. One method of making screen door stock and saving the molding. Gang splitting saws mounted on self-centering sleeve for use on molder spindle. Divided rip saw for use on top or bottom spindles. Position of top rolls for feeding special casket sides. Line-up of guide rail and inside head for making slack-center glue joints. Method of making stair rail in two runs. Special head rabbetted to receive formed lips. Self-centering "vise-grip" profile head. Two universal chamfer heads. A three-disc, combination head for grooving heavy planks, etc. Profile beader head fitted with high-speed steel, formed knives. A groove head for flooring. Transverse T-slot head carrying formed knives for multiple work. Knife setting jig for round heads. Radial gage for setting knives. A stand for setting and balancing irregular cutters. Jointing straight thin steel knives on a round head. Jointing thick knives on square head. One type of side head truing device in position. Formed stone and holder for jointing irregular knives on top or bottom head. Another type of side-head jointer and special four-wing, fast-feed head fitted with self-centering sleeve and thick high-speed steel cutters. Side head jointing attachment in position for jointing the formed cutters of a matcher head. Showing one type of jointing device attached to slide bar on a jointing and setting stand. A two-disc combination of self-centering clamp sleeve. Two different methods of making rabbetted molding. Showing how cutting angle changes with depth of cut, and how to lay out molder scale. Laying out knife profile with drawing instruments. Layout of knife to cut a perfect miter. Laying out quarter-round knives. How to cut, spread and twist spike knives. Lower half of cutterhead box prepared for babbitting. Proper location of oil channels. A handy babbitt scraper. Method of sewing belt with wire lace. Showing how laps in single and double-ply belts should run. Molding shapes and patterns.

It is the only book in existence on molder work, the operation and superintendence of the molder machine. 160 pages, 100 illustrations. Flexible Kerotal Leather Binding. Price $2.50 a copy, prepaid. Remit by postal money order.

GOODYEAR
MADE IN CANADA

EXTRA POWER BELTING

Pulling the Peak Load

Nearly every industry has some belt-drives with variable loads.

Nearly every industry has had belt trouble when the peak came on these drives.

One of the best things Goodyear Extra Power Belting does is to take care of peak loads without trouble.

How it has solved one peak load problem is told in a letter to us from the Chisholm Milling Company (reprinted here).

The very qualities which give Goodyear Extra Power its great advantage where loads vary, make it a better belt for all-round use.

The *pulley-gripping friction surface* pulls over the stiff places and prevents power waste through slippage.

The *great strength of the fabric plies* which are welded into one by much fine rubber, gives very long life.

Practically *all the stretch is taken out* of Goodyear Extra Power before you buy it—saving costly shut-downs to tighten belts.

The fine rubber, *which seals the seam*, prevents ply separation.

Over 1000 Canadian industrials have found Extra Power Belting an economical proposition—in price, in length of service, in efficiency of service. Some of them have solved problems exactly similar to yours. Let a Goodyear-trained belting man tell you about it. No obligation. Just phone, wire or write the nearest branch.

MILLERS AND DEALERS IN
CEREALS, GRAIN AND FEED
JAMES STREET & ESPLANADE
TORONTO

The Goodyear Tire & Rubber Co. of Canada, Ltd., Toronto, Ont. Nov. 15th, 1919

Gentlemen:—

About five years ago we bought our first Goodyear Extra Power Belting. To-day half our belts are Goodyear Extra Power, and as fast as old belts wear out we are replacing them with Extra Power. The performance of the first belt has brought about this change.

We were having trouble with our corn degerminator. Every now and then the machine would stick. Although we were using the highest priced belts we could buy, they continually hurnt through when the sudden load of a sticking degerminator came. One expensive belt went in two days. The next one lasted but little longer. Then we tried a Goodyear Extra Power Belt. IT gave us 18 months' service. When the degerminator stuck, Extra Power just seemed to buckle down to the job and pulled right through the peak load. It wasn't long before we decided to use Extra Power Belts on all our equipment.

Now we have installed them on grinding mills, corn mills, shaft drives, etc.

We figure that we save a great deal in price, save power, and get surer service.

Yours very truly,
The Chisholm Milling Co., Limited

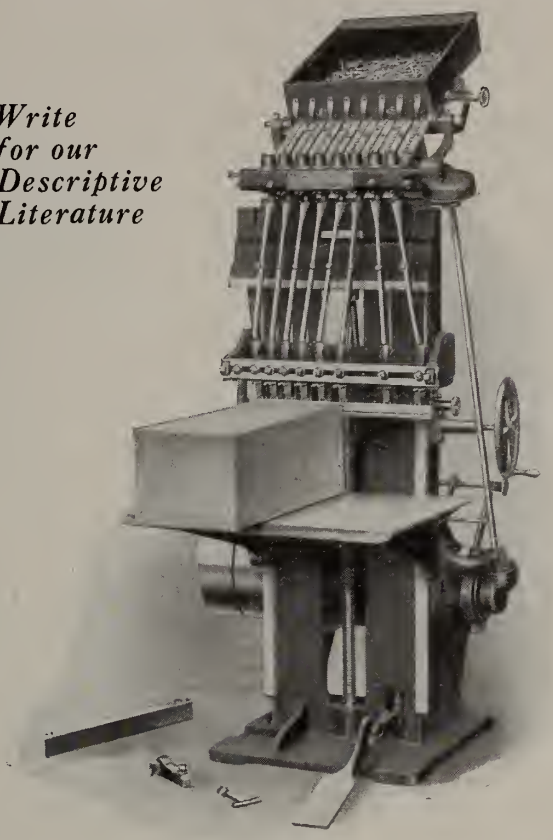
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

Reduce Your Haulage Costs with an OLSON FRAME EXTENSION

It is being done by an increasing number of manufacturers who have introduced this convenient truck extension into their delivery and haulage departments.

The Olson Frame Extension will fit any Ford truck and increase its carrying capacity for bulky loads. Its design gives a perfect balance to the whole truck, inducing smooth and easy operation. It is the ideal truck extension for hauling lumber, furniture, etc., for short or long distances.

For sale by all Ford dealers or full information sent from our nearest branch.

Swedish Crucible Steel Co. of Canada, Limited, Windsor, Ont.

44 Yates No. 275
30 and 60-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

8 New Andrew Mutiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

7 New Hermance Molders, 8, 10 and 12-in., stationary and slip-on heads.

Band rip saw, Fay & Egan, 42-in.
Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Carver, 5-spindle, Moore.
Door clamp, Fay-Egan, heavy.
Edgers, two, three and four saws.
Glue cookers and retainers. Glue spreaders.
Hogs, two, Mitts & Merrill.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Knife grinders, two 32-in., F. & E.
Lathe, Ober spoke and handle, almost new.
Lathes, Mattison, No. 8 auto; No. 6 block mach.
Lathes, speed, eight, mounted on iron bed.
Lock-corner machine, Morgan No. 8, full set.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, end, Sherman, fine condition.
Matcher, 24x6-in., 3 and 4 sides.
Automobile spoke machines, Defiance, complete set.
Band resaw, 50-in., Fay & Egan, tilting rolls, full set of filing room tools.
Molder, Smith 14-in. outside, latest style, practically new.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan No. 184, 12-in. outside.
Molders, inside, 13-in. American and Woods.
Mortiser and router, Fay & Egan No. 124.
Mortiser, chain saw, New Britain No. 1, 25 chains.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type.
Nailers, two, Morgan No. 8, used three months.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread.
Pony planers, 16, 20 and 24-in.
Relisher and mortiser, Greenlee.
Rip saws, self-feed, Hoosier, F. & E., Greenlee.
Router for stair stringers, H. B. Smith, flexible arm with adjustable table and forms.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30 and 42-in. Columbia; 30, 42 and 48-in. Invincible; 30-in. double Invincible.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Surfacer, 30-in. douhle, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, B. & M. double-end, also several single-end tenoners with and without copes.
Timber sizer, Fay-Egan s4s, 17x12-in.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

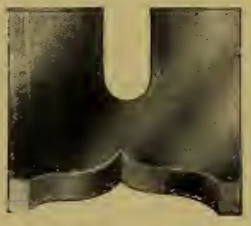
100% Production

will be necessary to meet the demand for all wood-working material and furniture that will be required for the 4,000,000 buildings that must be erected in 1920.

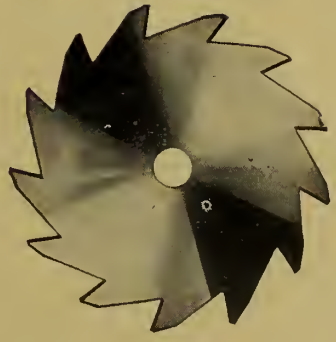


ATKINS

STERLING QUALITY

SAWS and KNIVES

will make it possible for you to meet this demand in producing your share.



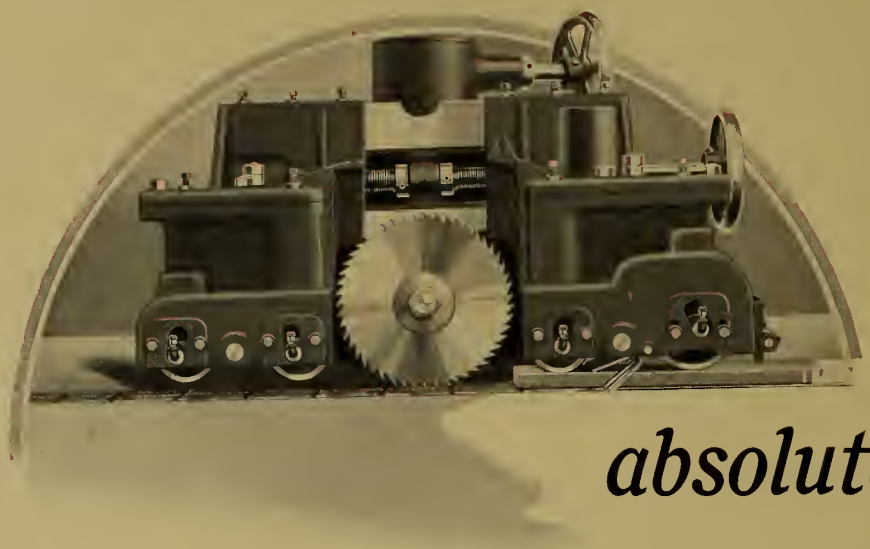
The high grade material and expert construction of Atkins Saws and Knives make possible the superior service they render.

Let Their Efficient Performance Tell You the Atkins Story of Perfection.

Write to-day for our Knife Booklet "CW" and Pattern Template Paper.

E. C. ATKINS & CO., ***Makers of Sterling Saws***

Factory—HAMILTON, Ont. **Vancouver Branch—109 Powell Street**



These are the Works —they insure an absolutely straight edge

MATTISON "RIPPER"

Built in two sizes.

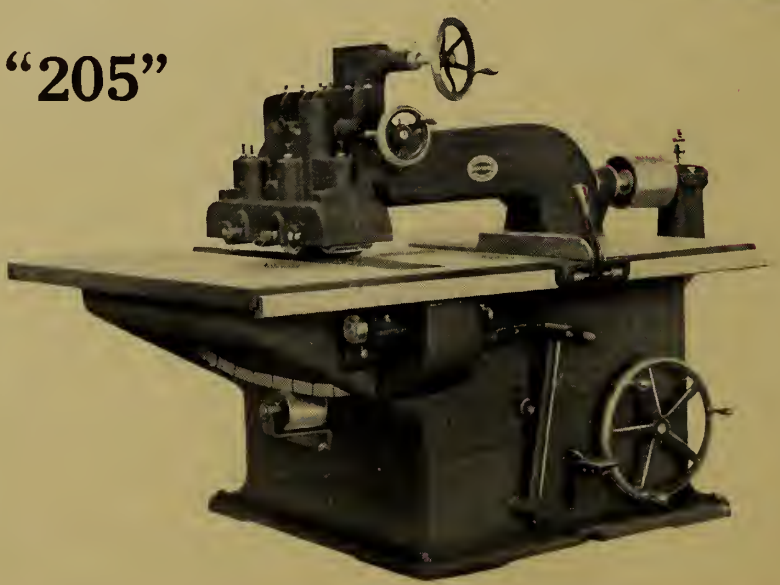
The "205" has 32 inches inside of the saw. The "207" has 18 inches inside of the saw.

Both sizes have the same general construction—built sturdy with the same powerful feed works.

Every possible adjustment is provided for, with all adjustments simple and right at the operator's hand.

"207"

"205"



We shall be glad to send our new descriptive circular upon request.

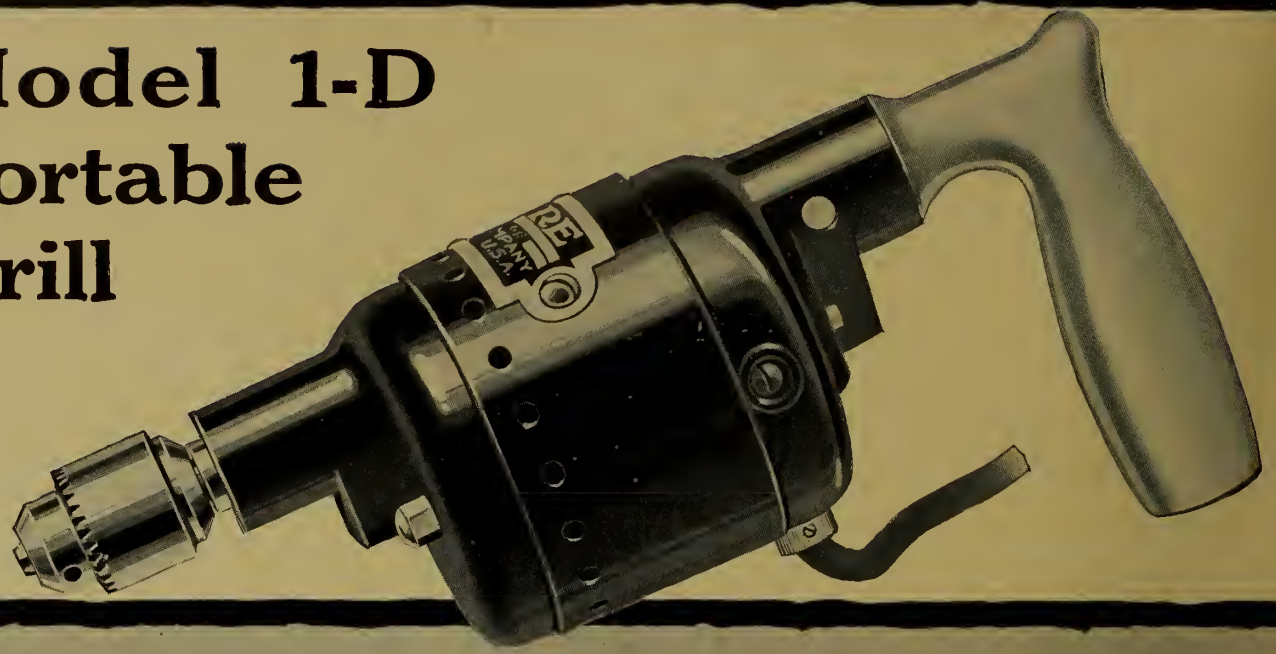
Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to $\frac{3}{16}$". Wood and alloys, 0 to $\frac{1}{2}$".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center $\frac{33}{64}$".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

DUMORE GEARED ELECTRIC DRILLS

Garlock-Walker's List of Wood Working Machinery in Stock

Manufactured by

American Wood Working Machinery Co.

1—AMERICAN FIG, 640, FOUR SIDED BOSS TIMBER SIZER, capacity 30″ wide, 20″ thick, 8 feed rolls, straight knives on all heads, only three years old, as good as new.

1—AMERICAN No. 229, FIG. 660, 15 x 6 HARDWOOD FLOORING MACHINE, equipped with six knife top and bottom heads, knife setting and jointing attachments, thoroughly overhauled, in first class condition.

1—AMERICAN No. 229, FIG. 660, 15 x 6 HARDWOOD FLOORING MACHINE, same as above.

1—AMERICAN FIG. 8442, No. 26, 10″ x 4″ FOUR SIDED FAST FEED OUTSIDE MOULDER, with slip on and off top and bottom heads, latest type machine, complete, overhauled and in A1 condition.

1—AMERICAN FIG. 8442, No. 26, 10″ x 4″ FOUR SIDED FAST FEED OUTSIDE MOULDER, same as above.

1—AMERICAN FIG. 8442, No. 26, 10″ x 4″ FOUR SIDED FAST FEED OUTSIDE MOULDER, same as above.

1—AMERICAN FIG. 8412, No. 22, 10″ x 4″ FOUR SIDED OUTSIDE MOULDER, in first class condition.

1—AMERICAN FIG. 8521, No. 5, 8″ x 4″ HOUSTON FOUR SIDED OUTSIDE MOULDER, overhauled and in A1 condition.

1—AMERICAN FIG. 8601, 6″ x 4″, FOUR SIDED OUTSIDE MOULDER, new.

1—AMERICAN FIG. 5014, No. 111, 54″ BALL BEARING BAND RESAW, carrying blades up to 7″ wide, capacity 30″ vertically, using extended rolls, 22″ without extended rolls; from ⅛″ to 20″ horizontally, will centre split a 16″ timber; cut a veneer from 12″ stock, rates of feed from 32 to 192 feet per minute, only three years old, in first class condition.

1—AMERICAN FIG. 5859 No. 3 DOUBLE CUT-OFF SAW, capacity between saws 8″ to 6′ 9″, 4″ thick, 30″ wide, equipped with two 16″ saws and power adjustment to movable table; new machine.

1—AMERICAN FIG. 5610, No. 25 EDGING AND RIPPING SAW, complete with countershaft; new machine.

1—AMERICAN FIG. 541, No. 4 CIRCULAR RESAW, with 24″ saw, in good working order.

1—AMERICAN FIG. 5701, No. 2 SELF-FEED CIRCULAR RIP SAW, capacity 25″ wide, 6″ thick, equipped with 14″ saw and countershaft.

1—AMERICAN FIG. 604, HEAVY SWING SAW, right hand to hang from ceiling, equipped with 48″ saw and shield; almost new
84 feet of ROLLER TABLE for use with above SWING SAW.

1—AMERICAN FIG. 616, No. 7½ COMBINATION SAW BENCH, with full set of gauges, without dado head; in first class condition.

1—AMERICAN FIG. 6390, No. 1 DOUBLE ARBOR UNIVERSAL SAW BENCH, with tilting table, full set of rip, cross-cut and mitre gauges, including one 16″ rip saw and one 16″ cut-off saw, countershaft; in A1 condition.

1—AMERICAN FIG. 6390, No. 1 DOUBLE ARBOR UNIVERSAL SAW BENCH, same as above.

1—AMERICAN FIG. 575, No. 2 HAND FEED RIP SAW, with countershaft.

1—AMERICAN FIG. 6312, CROSS-CUT SAW BENCH, movable saw operated by foot treadle, capacity 10½″ x 2½″, particularly adapted for cutting off crating stock; in A1 condition.

1—AMERICAN FIG. 514, 36″ BALL BEARING BAND SAW, with wire screen guards for top and bottom wheels; in first class condition.

1—AMERICAN FIG. 824, 24″ BUZZ PLANER, fitted with square cylinder, power feed attachment and countershaft; in A1 condition.

1—AMERICAN FIG. 937, No. 1 SINGLE SPINDLE SHAPER, with plain countershaft; in first class condition.

1—AMERICAN FIG. 1110, No. 6 DOUBLE DISC SANDER, 36″ dia. discs; in first class condition.

1—AMERICAN FIG. 1126, No. 9 UNIVERSAL KNIFE GRINDER, capacity for knives 31″ long, two sided knife bar, one side fitted with clamps for holding thin high speed knives, one side slotted and fitted with bolts for holding ordinary thick knives; in A1 condition.

1—AMERICAN FIG. 1127, No. 9 UNIVERSAL KNIFE GRINDER, same as above.

1—AMERICAN FIG. 1145, No. 2 DOUBLE END EMERY GRINDER, bench type, complete with countershaft; in A1 condition.

In addition to the machines listed above, we have a complete line of high grade new and used machinery for any and all purposes.

We solicit your inquiries

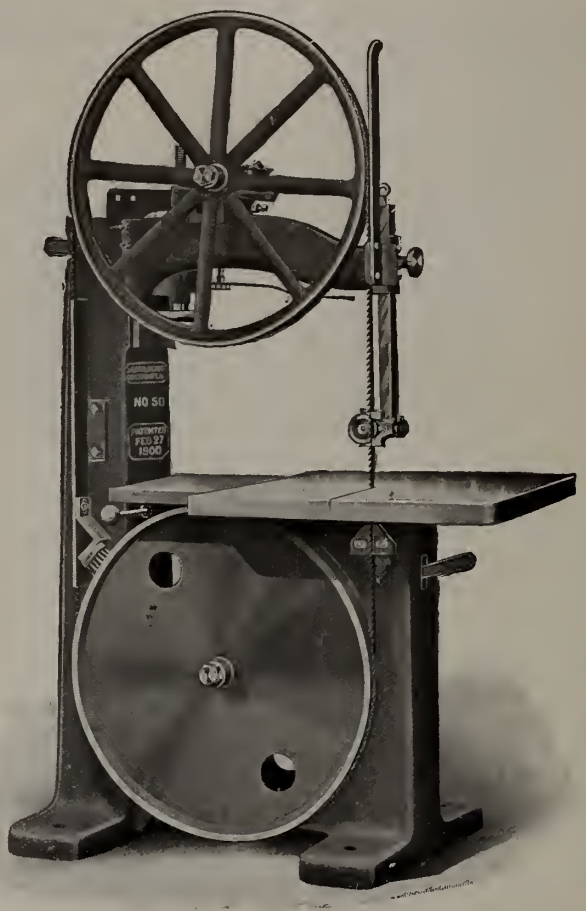
GARLOCK-WALKER MACHINERY CO. LIMITED

334 St. James St. MONTREAL

32 Front St., West TORONTO

567 Banning St. WINNIPEG

Everything in Wood Working and Metal Working Machinery



Save 25% to 50% of Blade Upkeep and Power Cost
Get Two, Even Three Times As Much Work

It's not the blades that wear out that cost, it's those that break.

It's the broken blades that cut down productive time and cost to repair and to replace.

Blade breakage is reduced to a minimum on Fay-Egan No. 50—36" **Square Column "Lightning Line" Band Scroll Saws.**

The Fay-Egan "Knife Edge" Blade Tension, made on the principle of a fine laboratory balance scale, is so sensitive that it compensates for changes in atmospheric conditions—yet, so flexible, you can pass a block between blade and wheel, while running, without breaking the blade. Folks tell us blade expense on "No. 50" averages 50 to 75 per cent. less than on the old timers.

The solid lower wheel acts like the fly wheel on your engine, its momentum carrying the load, so that the power consumption is reduced fully one-half, while at the same time it controls the light-spoked upper one, preventing over-running and choking down on a heavy cut.

The heavy square column eliminates vibration and permits the wheels to be revolved at 50 to 100 per cent higher speed, increasing the cutting capacity to double, and in some cases, triple that of the ordinary band saw.

As a user of saws, you cannot afford to ignore what Fay-Egan Square Column Band Saws are doing for others and can do for you. An investigation does not obligate you.

J. A. FAY & EGAN CO.

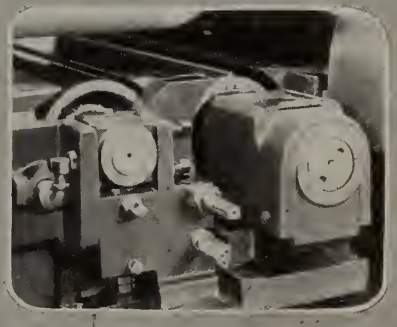
153-163 W. Front St. CINCINNATI, O.

"A CLEAR BARGAIN—A DEAR FRIEND."

Yates type B-2 has earned its famous name by remarkable performance wherever it has been installed, not by bursts of speed for short periods, but by steady day after day production.

To learn more about this machine, write for our new illustrated circular, which will be sent free on request.

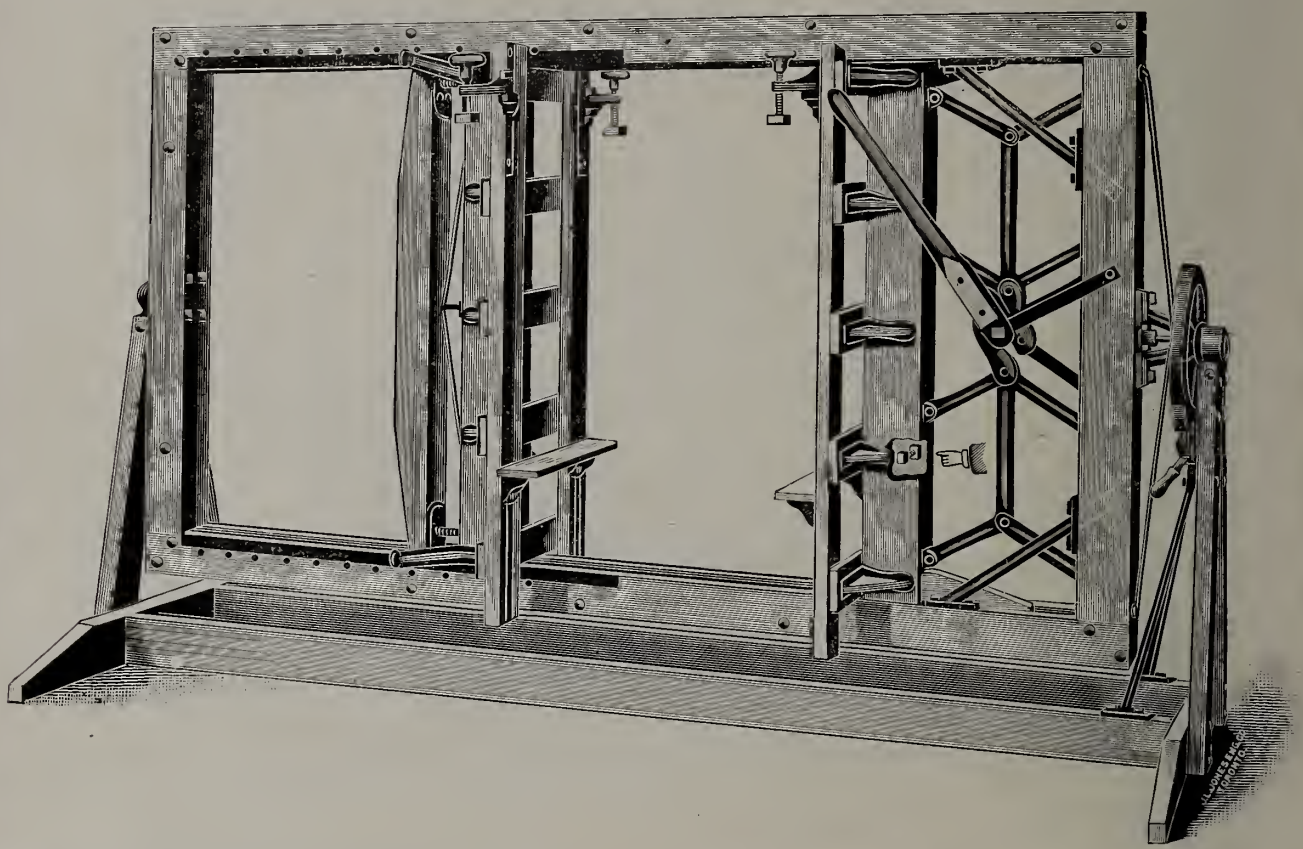
P. B. Yates Machine Co. Ltd.
HAMILTON. ONT. CANADA
United States Plant, Beloit, Wisconsin



SECTION OF B-2 SHOWING BOTTOM HEAD

"The Invariable Choice of the Man Who Knows"

No. 190 Improved
Revolving Case Clamp
for dressers, bureaus, wash stands, phonographs, etc.



Will Give You Five Times The Output

This machine eliminates all unnecessary handling of the work. The clamp takes in a wide range of sizes as one end is moveable to any position, while the other end has sufficient movement to allow the case to be tightly clamped. This is done by means of the large lever shown at right of cut. A brake at the extreme right instantly stops the machine in any position.

The clamp requires but one man to operate. It will not spring, does not have to be released before revolving, and the workman can get at all parts of his case while standing in front of the machine. Made in two sizes, 50 inches high, by 5 feet wide; 72 inches high, by 5 feet wide.

Prices and further particulars await your request.

Jackson, Cochrane & Company
KITCHENER - CANADA

The "Shimer Limited" Expansion Head

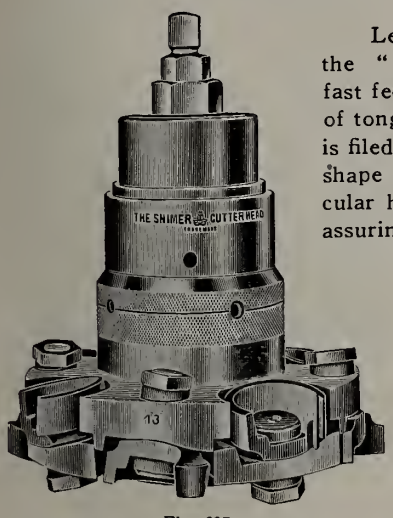


Fig. 627

Let us draw your attention to the advantages of using the "SHIMER CUTTER HEAD" for general Mill and fast feed Planer work. The Cutter is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The bit being circular has from 3½ in. to 5 in. cutting length to the cutter, assuring long wearing life to the cutters.

Note that the cutter, being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without the Self-Centering Sleeve, and made Expansion or Solid, to suit the customer's wishes.

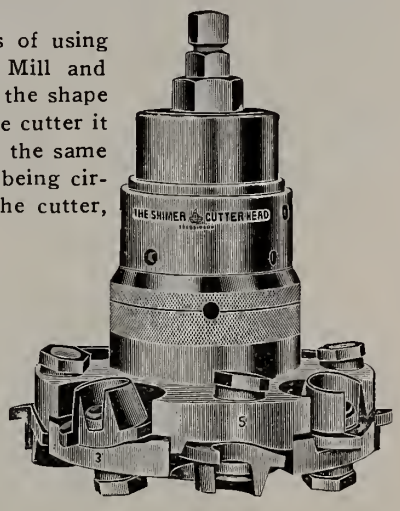

Fig. 268

Shimer Heads have been in use for sixty years, and their reliability and reputation have spoken for them in the past. Let us know your wants and we will guarantee their reliability at the present.

SHIMER CUTTER HEAD CO. OF CANADA, LIMITED

Successors to Samuel J. Shimer & Sons, Inc.

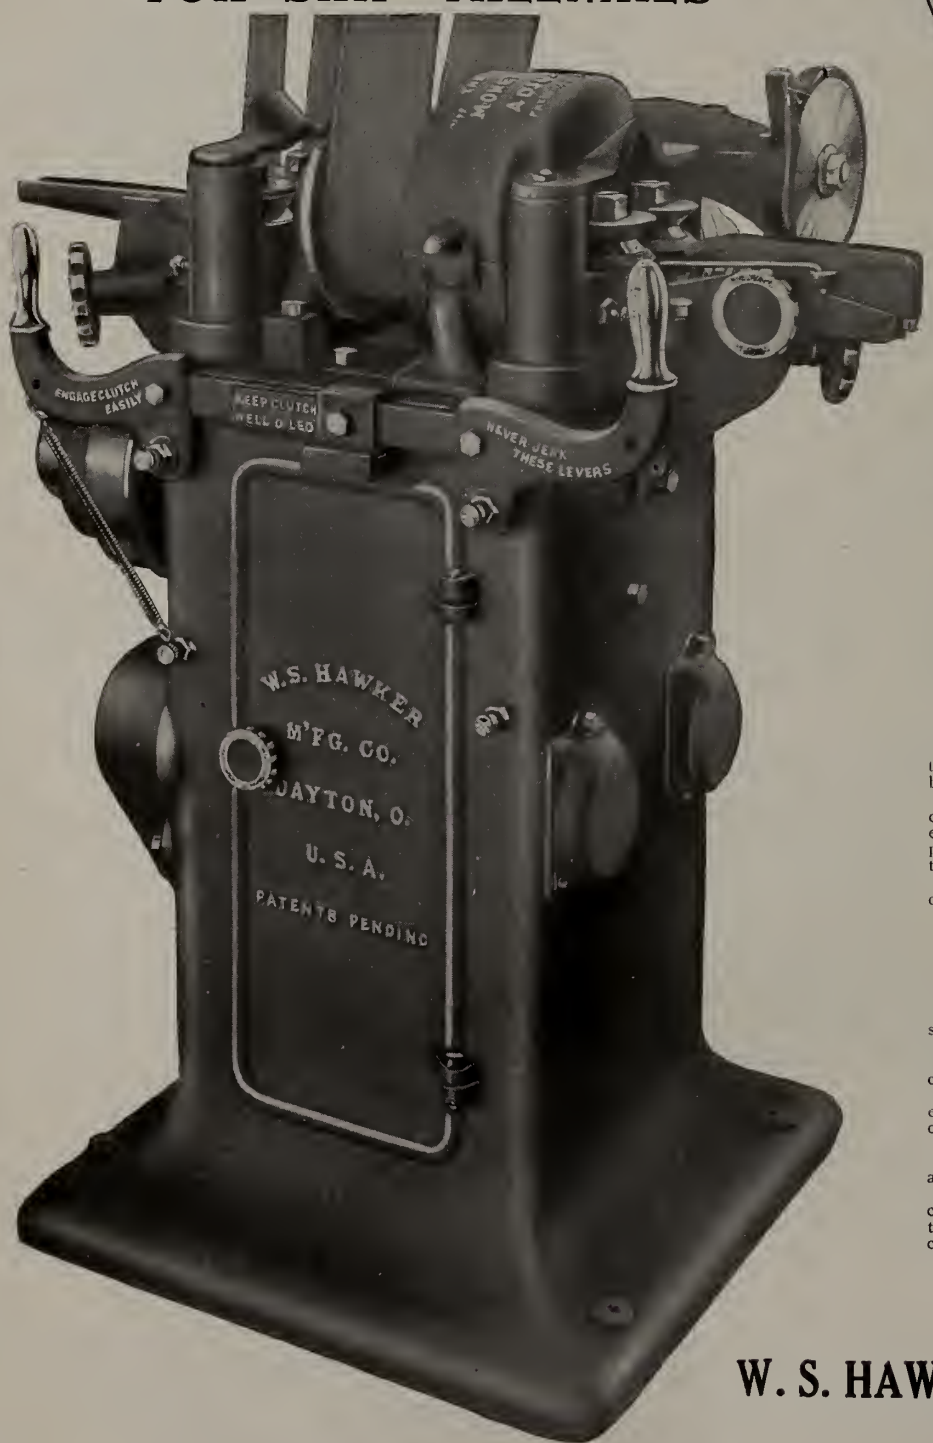
FOR SHIP TREENAILS



W. S. HAWKER.

Inventor and Designer of the World's most efficient Tubular Turning Machinery

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

HIGH LABOR COSTS

are giving you as much worry as they are giving us. We can show you how to ***reduce*** them by driving ***seven*** screws in the time formerly occupied in driving four.

Read below what one large furniture manufacturer said about our screws to one of his competiors.

See That Square Hole?

See That Square Hole?

Robertson Patented Socket Head Wood Screws

We are in receipt of your letter of the 17th in reference to the Robertson screw. We were rather backward in trying to make ourselves believe that this screw is as good as the old slot screw, but we have entirely changed and are now using the socket head screw exclusively. It would surprise you how many more screws of this make the workman can drive than of the old style. You will make no mistake in using their screws altogether.

WE MAKE AND SUPPLY FREE WITH FIRST ORDER BITS FOR USE IN REYNOLDS MACHINE OR ANY OTHER TYPE DRIVER.

SKF Payroll Policy

THE FIRST ESSENTIAL in Ball Bearing applications is to give you a recommendation that will be absolutely successful, and surpass your highest expectations as to efficiency and durability.

THE SECOND is to make the price as low as possible. This can only be done by large production of "one quality product"—THE BEST.

Our affiliations are a guarantee to you of the above requirements being properly fulfilled—

SKF Industries, Inc., New York.
SKF Ball Bearing Co., Hartford, Conn.
Hess-Bright Mfg. Co., Philadelphia.
Atlas Ball Mfg. Co., Philadelphia.
SKF Engineering Laboratories, Philadelphia.

Factories also in England, Sweden and France.

"A SERVICE UNEQUALLED."

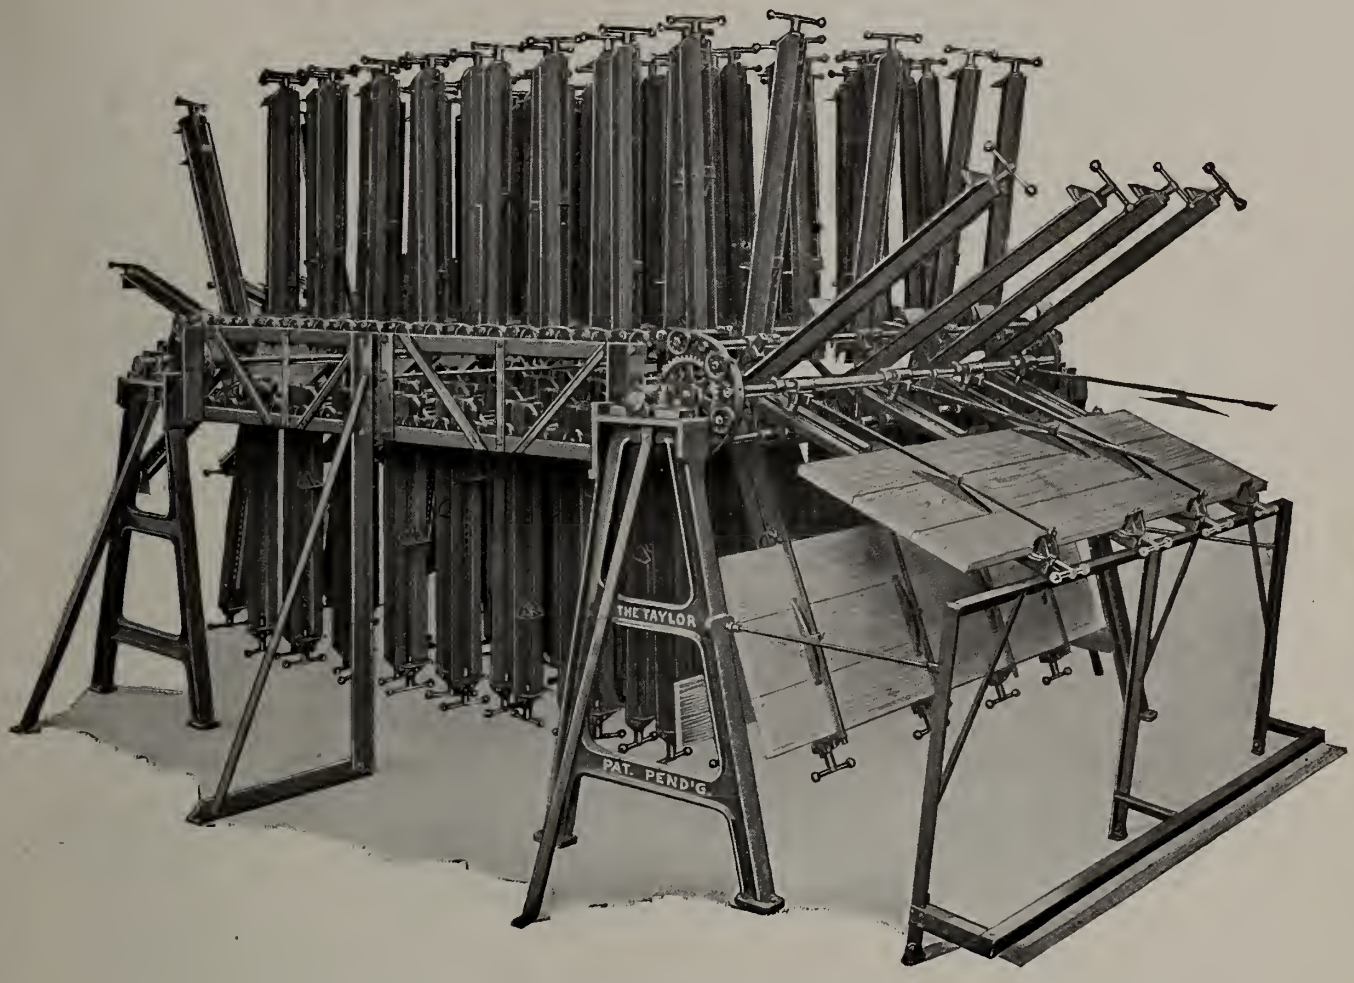
CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

REASONABLE PRICES—that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

RED GUM

"AMERICA'S FINEST CABINET WOOD"

The really successful merchant, it matters not in what line, is he who takes the trouble to ascertain

WHAT THE PUBLIC WANTS

This is especially true in its application to the furniture manufacturer and his retailer. He *has to* study his public—or he soon will have no public.

That portion of his public which is influenced by the principles of good taste wants RED GUM furniture—Why? Because the color, grain and soft, velvety quality of this, the finest of America's cabinet woods, when handled by a master cabinet-maker, results in a thoroughly charming piece of furniture—the kind that people of nice discrimination like to have around—and want strongly enough to *ask for*. Then can YOU supply it?

Makers and dealers desiring to see samples of RED GUM, both rough and finished, are invited to correspond with us at once.

ADDRESS: RED GUM DIVISION

but also *for those WHO SELL IT—*

IS THIS YOU?

Month by month we are working on the CONSUMER (*Your Customer*) for a big, strong "COME-BACK" **of OAK!**

Watch us!

Does your line meet the issue? If not, it can by next season.

STILL ANOTHER OAK FURNITURE ADV. APPEARING IN THE BEST MAGAZINES IN AMERICA.

OAK, as a CABINET WOOD, is serene in its conscious superiority.

Responsive alike to the best skill of the artisan and the artist, OAK combines all the qualities which contribute most to a home whose FURNITURE must (because of the little folks) at the same time impart ideas of beauty, dignity, poise and permanence—and good-naturedly repel the onslaughts of buoyant youth.

no finer heirloom than good OAK furniture."

...fe and enduring investment—none bet...

ROOM 1408, 14 MAIN STREET, MEMPHIS, TENNESSEE

Iowa Walnut

for

Dining Room Furniture

No cabinet wood responds so fully to the art of the furniture designer or the skill of the workman as Black Walnut. It meets every requirement.

Dining room furniture of walnut possesses a lasting charm and beauty that age does not destroy, and a liberal use of this wood in furniture factories guarantees the quality of their product.

The cost of walnut is moderate. In view of existing conditions it is the most economical cabinet wood now on the market.

We will appreciate a list of your requirements of walnut lumber and veneers.

Des Moines Sawmill Company

DES MOINES, IOWA

"Hartzell" Lumber and Veneers "Hartzell"

American Walnut Exclusively

"Hartzell's Choice Walnut"

Furniture manufacturers will do well to note that we produce only American Walnut, and therefore can be classed as the logical source of supply in this wood, and our years of experience in handling American Walnut will prove valuable to you if you desire to take advantage of it.

By saying that our long experience will prove advantageous to you we mean that you should by all means take time to examine our line before purchasing, because the quality will be far superior to the average line and the price no greater.

We study your particular interests and produce veneer of the kind and quality that is best adapted to your work, and whatever class of figure you are using we can give you a complete uniform line of just the wood you want for your selection, and it will not be necessary for you to handle a great lot of all sorts of samples and then find only a few stocks suitable for your needs.

When you purchase our line you can rest assured that you can duplicate your purchase just as near as it is possible to do so in Veneers, that is our part in serving you and we see to it that you are served right.

"SEND YOUR INQUIRIES FOR VENEERS TO US."

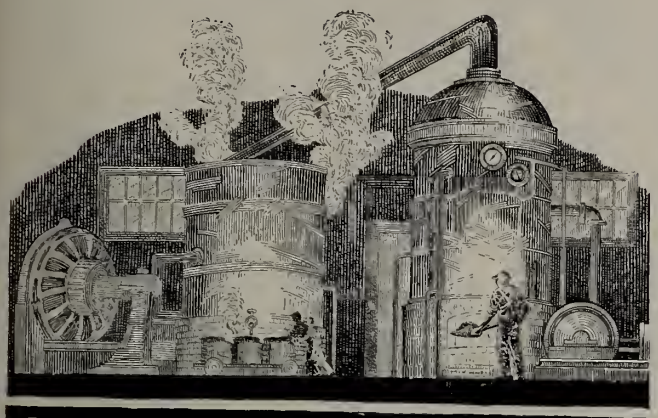
Yards: BUFFALO, N.Y. Mills: KNOXVILLE, TENN.; FONDE, KENTUCKY



The Canadian Wood Turpentine – made at our mills at La Tuque, P.Q. is an excellent diluent and solvent and contains no free rosin ~

This Turpentine is made by an improved laboratory process from Canadian wood and its distinctive odor clearly indicates that it is a different product from that given by the older methods of distillation ~

Improved Glue Heater

No heat controllers or other safety guards are necessary with this heater, **because it cannot injure glue.** It's simple, substantially made of copper and costs less than any other.

Let us tell you more about it.

We make any size desired.

Cincinnati Glue Heater Company
Cincinnati, Ohio

CASCO
Waterproof Glue

STRENGTH

Admittedly greater than the **best hide glues,** infinitely stronger than the vegetable glues.

COST

FOR JOINTING. Very much less than the hide glues.

FOR VENEERING. A little more per pound than vegetable glue, but little, if any, more per GLUE LINE FOOT.

PRODUCE THE BEST VENEERED PRODUCT. It costs no more in the beginning and very much less in the end. Hundreds of the larger manufacturers are using CASCO after exhaustive tests in comparison with other adhesives.

MANUFACTURED BY

The Casein Manufacturing Co.
15 PARK ROW · NEW YORK CITY

NOTE. Send for Casco Red Book. It contains much information on glue, veneer and panels.

Carborundum Brand
GARNET PAPER
AND
CLOTH PRODUCTS
They Give the Service

In your Sanding Room, Finishing Room, etc., where efficiency is necessary, Carborundum Brand Garnet Paper and Cloth Products should be in use. Every roll, sheet, strip and belt, clean fast cutting, long lived, wonderfully flexible and uniformly coated with hard, sharp, pure Garnet.

We can ship your order promptly from our large stock always on hand.

Norman Macdonald
62 and 64 Temperance Street
TORONTO - - ONTARIO

Permit us to advise:

THAT you store your Garnet Paper and Cloth in a clean, dry, evenly heated, well ventilated room.

Moisture and changes of temperature weaken the glue, loosen the grain—take the pep and life out of the backing and lessen, generally, the working efficiency of any garnet products.

In the great Carborundum plant, all Carborundum Brand Garnet Products are stored in stock rooms.

There they season or cure for weeks before you get them. There is no moisture, no dirt, no sudden temperature changes.

Your stock of Garnet Products should be cared for in your plant in just the same way.

To get the most and the best out of Garnet Paper and Cloth, you must keep them right

Carborundum Products are Carborundum and Aloxite Grains and Powders, Grinding Wheels, Sharpening Stones, Paper and Cloth, Garnet Paper and Cloth and Carborundum Refractories

Training the Factory Help

It is generally conceded that present conditions are abnormal, and that increased production is the panacea that will cure most of the economic troubles with which we are confronted. The demand for manufactured products is greater than the supply. The demand for skilled labor is also greater than the supply, and many employers do not recognize or have closed their eyes to this fact.

There may be many basic reasons for the world-wide demand for goods, yet the shortage of everyday necessities and the inadequate supply of capable mechanics are very closely related. In spite of this many manufacturers attempt to improve conditions in the production end while ignoring the fact that some effort should be made, at the same time, to improve the labor situation.

The output of a certain plant is to be increased. A large addition may be erected, new labor-saving equipment may be installed, the whole factory system reorganized, or other changes made that will further this plan. When all is in readiness the usual procedure is to go into the larbor market and make an effort to secure the required number of skilled workmen.

If the inducements offered and the working conditions are sufficiently attractive no doubt this effort will be successful and thus production will have been increased, but at the expense of some other plant or some other industry. The labor situation has not been improved. The available number of skilled employees has not been increased. What has occurred is that a certain number of trained hands have been induced to transfer their services from one employer to another. The furniture manufacturers have had this fact brought to their attention through the automotive and other industries taking their cabinetmakers and upholsterers.

It is possible that this may be one of the reasons underlying the restlessness that permeates the ranks of labor. Workmen who might have learned to settle down and stick to a worth-while position have found it easy to jump from one job to another. Their services are in demand and they think that they will have no trouble in securing employment wherever they go.

While lumberjacks should not, perhaps, be classed with skilled mechanics, the situation which is found in the camps this season will serve as an illustration. Practically all the logging camps are shorthanded, consequently every man who applies for work is taken on. The result is that the men are taking advantage of this demand for their services and are wandering from camp to camp, working anywhere from a day to a week or two in each place, then moving on. This movement has developed such proportions that the output of logs is being curtailed and operation costs are mounting. If the men were not sure of employment in the next camp they would hesitate before throwing down their tools.

Every manufacturer, whether woodworker or ironworker, should adopt the policy of training his own help. True, there are the technical schools; and they are doing a good work, one that merits the encouragement and active support of every employer of skilled workmen. The idea behind the technical classes is to make better citizens, rather than train mechanics for any particular factory. It is a case where each employer must as an individual do his part. The "let George do it" attitude will not avail. On the other hand, there is plenty of room for mutual understanding and co-operation.

In the woodworking plants a desirable course should consist of practical instruction in the care and operation of the different machines and other phases of the work as cabinet making, veneering, finishing, etc. Other subjects, such as the reading of drawings, the making and reading of rods, taking off stock lists and the simpler forms of shop arithmetic might profitably be covered. As a person can read a drawing with greater accuracy and speed if he is able to make a drawing, so a course in drafting, designing and sketching should be desirable.

This policy is being followed in many plants and the results achieved have been most gratifying. The efficiency of the different shops has been improved, with a consequent increase in production. In addition, it has been proven that intelligent, though inexperienced workmen, with proper assistance and training can become better producers than the average mechanic who is available in busy times, and who claims to be an expert workman.

Designing Built-in Buffets and Cabinets

Should Conform to General Style of Room—Utility of Article Should Never Be Lost Sight of—Space Saved When Let Into Wall—Attractive in Mission Style

By W. H. Shaw

There is a considerable difference of opinion as to the usefulness of sideboards or buffet. Some housekeepers consider them indispensable, while others look upon them as useless expensive ornaments. There is much to argue on both sides of the question, and the opinions of various ladies are usually based upon their own personal experience, rather than upon general information on the subject. Many sideboards are mere ornaments, having very little practical use, and costing a considerable amount of money. Sideboards, however, can be made both practical and ornamental. To make them mere ornaments, or mere cupboards to use as a china closet, is an easy matter, but to combine both beauty and usefulness, presents many difficult problems.

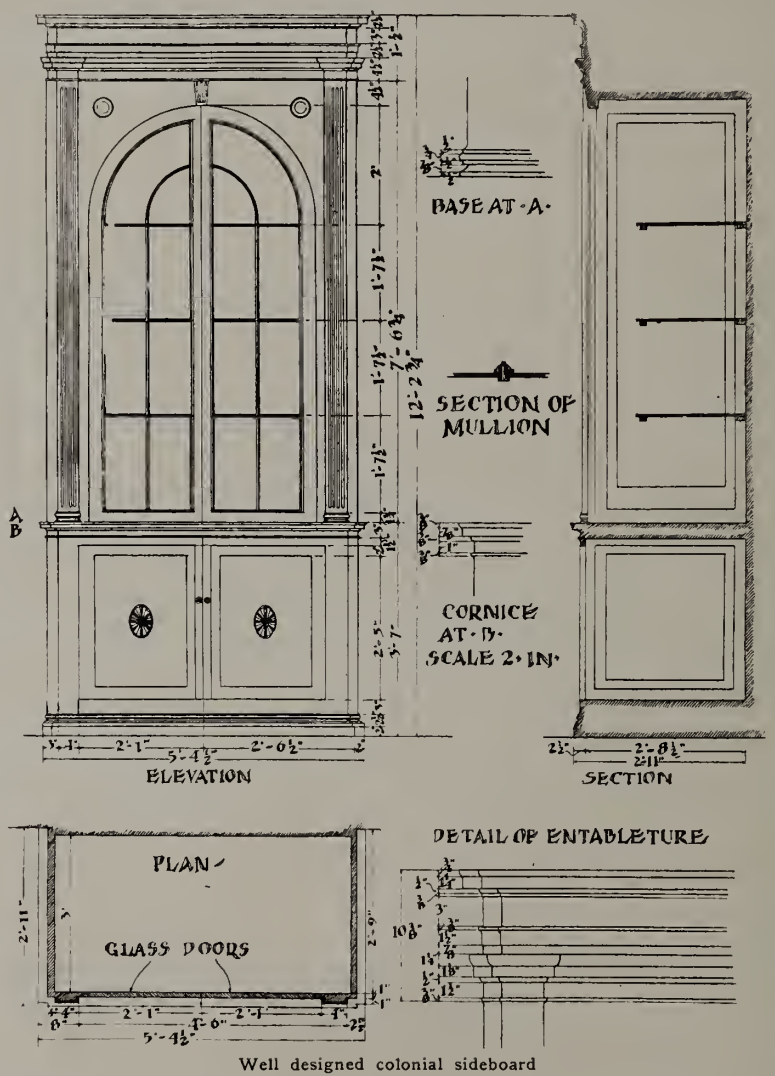
Consider Style of Room

In the designing of a sideboard or buffet, the very first consideration should be the style of the room. If it is a simple home having a plain stairway and fireplace, the sideboard should be made in keeping with the general style. For example, if the general style adopted throughout the house is colonial, a mission sideboard would not be in good taste. Neither would a colonial sideboard be proper for a mission interior. The size of the room in which the sideboard is to be built, should also be taken into consideration. Many an otherwise pretty dining room has been ruined through building in a large massive sideboard, which seems to predominate over the entire room, making the room look smaller than it really is.

To overcome this very fault, mirrors are used in sideboards to a large extent, to give the effect of distance, and here is the one place where a mirror is in good taste. This cannot be said when they are used on mantels over fireplaces.

Some builders and owners prefer instead of the sideboard being built into the house, to provide an alcove in the wall to permit a movable sideboard being used, and in many rented houses and apartments they are built of the same wood as the dining room trim, and although movable, are considered as a part of the permanent furniture of the apartment. In many cases the mission design is followed.

Although this mission furniture may seem simple to make, it requires considerable skill. However any carpenter, who is proficient in the use of his tools and is capable of applying to furniture making the knowledge he has of carpentry, can turn out some attractive and saleable pieces.



Well designed colonial sideboard

In the olden times the mortise and tenor joints were much in evidence, the tenons projecting through and being held with wedges. But now the term "mission furniture" is applied to almost any style of hand made work, although the builder of the early mission furnture would hardly recognize the pieces turned out today. Then oak lumber, which grows more and more beautiful with age, was nearly always used. Now all sorts of woods are used and usually are stained to represent oak.

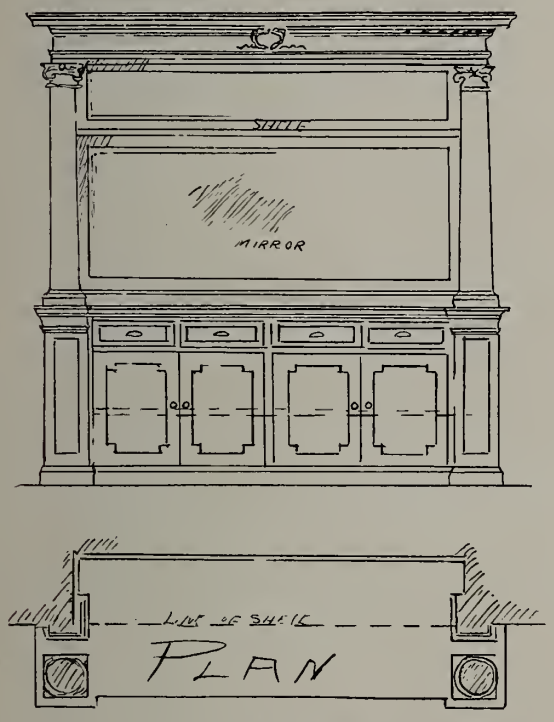
Space Saving Features

The built-in sideboard should be made to take up as little space in the dining room as possible, and for this reason it is a good plan when practicable, to build it into the wall, taking the space necessary for it off the ajoining kitchen or pantry, as the case may be. When this is done, it is often a convenient arrangement to have a little sliding door arranged in the back for passing dishes through, especially when there is no servant in the house. It saves many steps and sometimes accidents. These sliding doors should be pretty well concealed. To be entirely practical, the built-in sideboard should have one large open space in the center for the cut glass punch bowl or the silver service, with possibly a shelf or a row of small cupboards with glass doors above it for valued

pieces of china. In the lower part, there should be at least two shallow drawers subdivided with quarter inch partitions for knives, forks and several sizes of spoons. There should also be double cupboard doors with one or two long shelves behind on which to lay table cloths with as little folding as possible. These things are necessary for a well arranged sideboard. In addition, however, it is best to have several more drawers in which to keep table linen, etc.

Attractive Mission Style

Illustrations show several sizes and styles of sideboards and china cupboards. Some of these designs are distinctly mission and should only be used in the dining rooms which are otherwise in the mission style. In both of these designs the arrangement of having a row of small square cupboards at the top with dividing glass lights has been adopted. Place behind these small pieces of decorative china, and the effect is very pleasing. In one design the cupboards



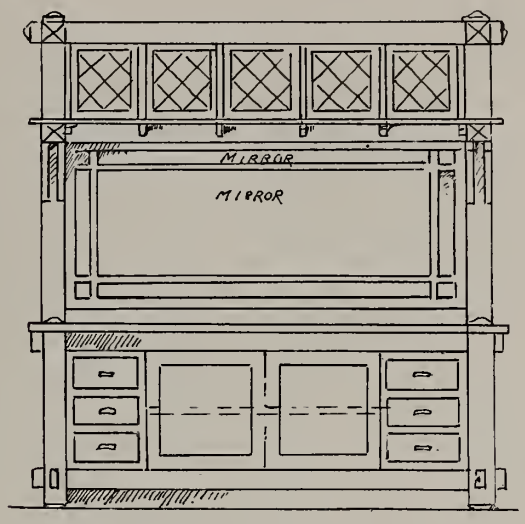
Massive design for large room

have been carried down both sides and in the rear of the center portion. An unusual effect is obtained by panelling off the mirror with narrow strips in front of it, giving a kind of garden fence effect.

Below the main counter shelf are six drawers and plenty of cupboard space. This fixture if stained or dark mission and placed in a suitable room, would be very attractive. It is not, however, a fixture suitable for a small room.

Well Designed Colonial Sideboard

One of the simplest, but at the same time, most attractive designs of those submitted in the line of drawings is that of the colonial sideboard, having a cornice supported by two small Ionic columns, which are set upon pedestals. This fixture is drawn, as shown by the plan, to be set partly into the wall and



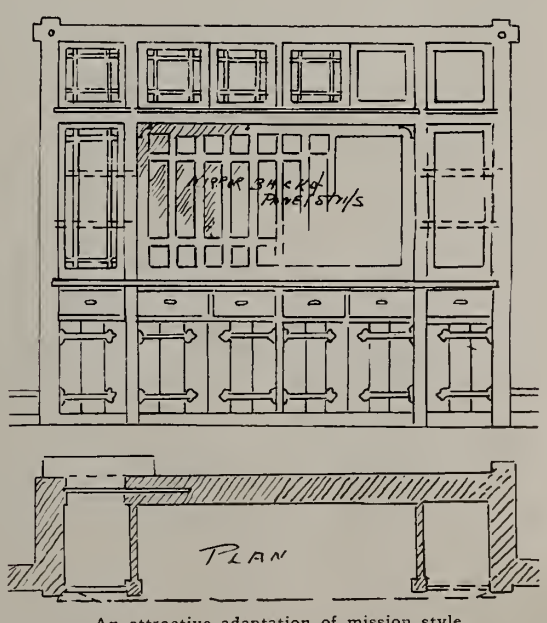
Mission style built-in buffet

partly into the room. In this manner good depth is obtained. Right here that point should be emphasized. Never build a built-in sideboard of shallow depth. It not only fails to look well, giving a cramped appearance, but in addition it is very annoying as little use can be made of it.

The Colonial fixture shown would look very well in mahogany or birch, stained dark. If the dining room were finished either in mahogany or white enamel, this sideboard would harmonize. There is nothing fussy about it. It is perfectly simple and therefore calls for little description; but it is probably the best appearing sideboard in this collection, being practical as well as ornamental.

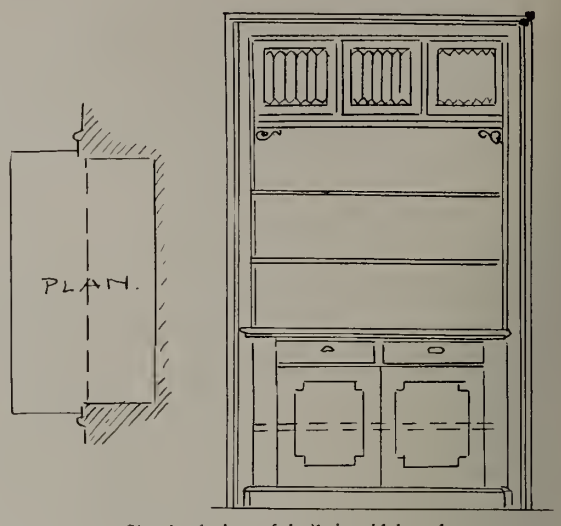
Size Conforms to Room

The dimensions of sideboards vary considerably. There is nothing about them that calls for any fixed rules. They look the best however if kept on a line at the top with the top line of the window casing, and



An attractive adaptation of mission style

Plain built-in sideboard for small cottage



Simple design of built-in sideboard

if there is a plate rail in the room, it is best to have it line up with some part of the sideboard. Also if there is a wainscoting or panelling in the dining room, it looks best to have that line up with the main counter shelf of the sideboard, which should be, under most conditions, about table height from the floor or 30 to 32 inches. The width of the sideboard can vary according to its design and the size of the room.

One very simple sideboard is shown and for a simple little cottage home it has much to merit attention. The general effect is that of a cased opening, a casing has been carried around it in the same manner as a rounded door with the upper part of the sideboard built into the wall and the lower part projecting into the room about one foot. In the upper part is a row of cupboards with leaded glass lights, separated by brackets. Two shelves are shown between them and the counter shelf, but the lower one may be omitted if desired.

Preparation of Stock for Bending

To render wood pliable, both moisture and heat are required. Neither of these factors is fully effective in the absence of the other. There should be moisture enough, experiments at the Forest Products Laboratory indicate, to saturate the cell walls, which amount is equivalent ordinarily to a moisture content of 20 to 30 per cent. No better effect is noticed where there is additional water in the pores or open spaces of the wood. The pliability of wood apparently increases quite rapidly with increase of temperature. Very high temperatures, such as accompanying steam under pressure, however, are not advisable, since they render the wood brash; in fact, boiling for any length of time permanently reduces the strength and toughness of wood to small fractions of their normal values.

Freshly cut stock is, of course, thoroughly saturated and needs no additional moisture. Only heat is required to produce flexibility. If the stock has dried for a long time, it will have a uniformly low moisture content throughout, probably about 12 to 15 per cent. Such material requires the addition of a considerable amount of moisture before it is in proper condition for bending. If the stock has dried for a shorter period, the interior part may be at a high moisture content while the exterior surfaces are quite dry. Such stock needs the addition of sufficient moisture to bring each part of it up to about 25 per cent.

Condensation of the steam may not furnish sufficient water if the stock is very dry; in this case the addition of a hot-water spray to play on the stock in the steam box would be advantageous. Admission of the steam through water will insure its being thoroughly wet.

During steaming, the stock should be so piled that steam has access to all sides of each stick.

The following is an extract from an interesting letter recently received at the Forest Products Laboratory from a chair manufacturer, regarding the preparation of stock for bending in a hot press: "We use a horizontal retort for steaming our wood before bending. We previously had been using fairly green lumber with a high moisture content steaming it with live steam about 30 to 40 minutes at 5 lbs. and 10 lbs. pressure and then bending. Our breakage averaged around 15 per cent. on lumber about 11/16 inch thick. Recently we experimented along the lines of filling the lower part of the retort with water, through which the steam had to pass, and raising our grates to keep the material out of the water. We found by experiment that we got the best results by this method and by carrying no pressure on the inside of the retort and steaming about 4 hours before bending. In this way, on lumber "bending dry", we reduced our breaking to about 5 per cent. We have just bent some ¾ in. mahogany (Cuban) over two years old in this way, with about 10 per cent breakage."

Another manufacturer states that in the hot-plate bending of red gum chair posts, he has recently improved his output by spraying the stock with hot water while in the steam box.

Don't try to wipe or oil machines while in motion; stop the machine first. It's safer.

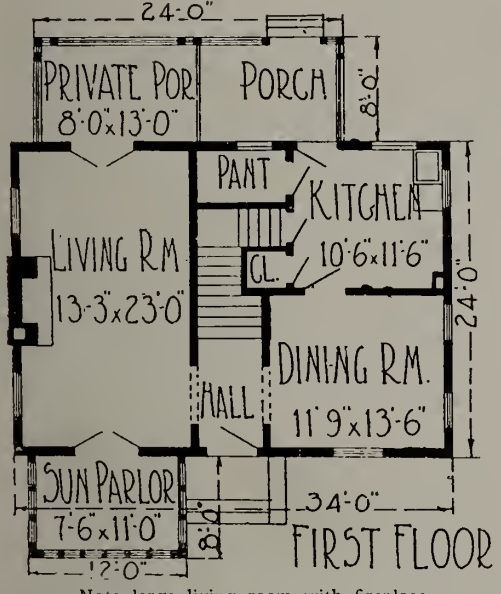
The modern A.B.C. for the whole community, "Always Be Careful."

Attractive Design for a Comfortable Home

Six Roomed House Built for Comfort and Convenience—Sun Parlor and Sleeping Porch Desirable Features—Designed for Economical Construction

The plans which have been published in recent issues of this journal were of houses that, while giving a maximum of comfort and convenience, could be built for a minimum outlay. This month we illustrate a house that is larger, more pretentious and that would cost more money to erect.

The accompanying prospective shows a very attractive design for a six room house with sun parlor



Note large living room with fireplace

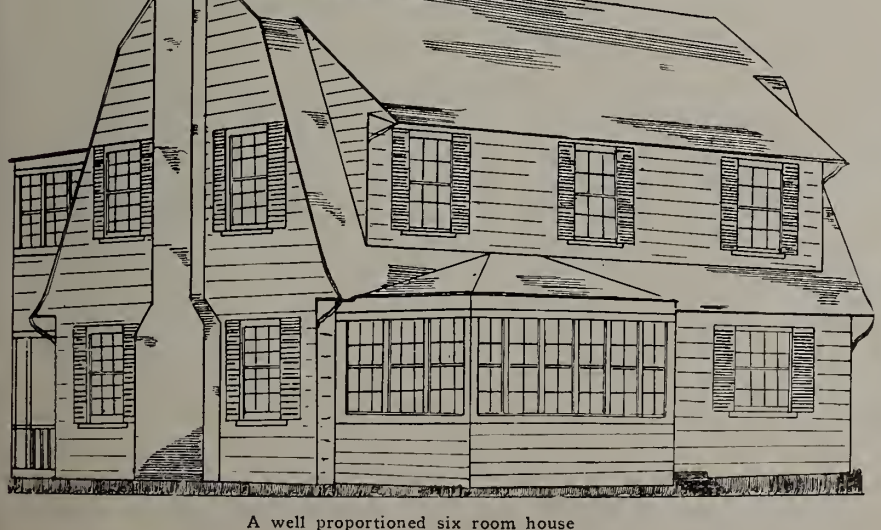
and sleeping porch. The large living room with its grate, sun parlor and porch and the equally large bed room above should prove particularly attractive to the lady of the house.

The rooms are well laid off with a minimum amount of space devoted to halls. The pantry off the kitchen could be fitted up as a breakfast alcove if desired. Having the living and dining rooms separated by the hall is desirable as it gives greater privacy to the latter room. A plentiful supply of closet room is provided for, the bedrooms being especially fortunate in this respect. The entrance, which does not appear on the drawing is beside the sun parlor.

The gambrel roof type of house with a large dormer, such as this, is very economical to build. The front and real walls of bedrooms are practically formed by the roof. The large number of windows provided, each room having two or more, not only enhance the appearance of the house but make it bright and cheery inside. The shutters while not essential certainly add to the appearance and should if possible be included.

The cost of constructing a house like this, not including plumbing, heating and excavating would figure out to about $9,000. This figure would be influenced by locality, freight and local conditions. If the sun parlor and porches were omitted, the cost would be lowered but the utility, comfort and desirability would be correspondently lessened. The estimated figure of nine thousand provides for good solid construction and includes labor, lumber, lath, shingles, No. 1 fir finish, edge grain flooring, plaster, cement, etc., windows and doors, storm windows and doors, screen windows and doors, fittings, paint and other items required to complete the house.

The first permanent wooden house under the new building scheme was completed and occupied near Norwich, England. The house was erected by a Norwich firm which has converted its aircraft factory into a workshop for making standardized sections for these houses. The manufacturers state that they will be able to turn out similar houses at the rate of 50 per week. The total cost, providing for six rooms, is about $3,275 (at normal exchange) and such houses may be completely erected within one month.



A well proportioned six room house

Layout of second floor

Motion Pictures of Furniture Industry

Furniture Manufacturers Discuss Publicity Campaign—Business Profit Tax Considered—Interesting Report of Buffalo Meeting—XL Plates Unobtainable

A special meeting of the Furniture Manufacturers' Association was held in Toronto on Wednesday, March 10. This called for the purpose of discussing the Business Profits War Tax Act and the question of a publicity campaign, including the employment of motion pictures and also to hear the report of the representative who attended the meeting of the National Association of Upholstered Furniture Manufacturers, which was held recently in Buffalo, N. Y. The number of members in attendance was most gratifying and a very interesting and instructive discussion ensued.

It was decided to form a Publicity Committee consisting of two sections, one to consider the question of the general advertising of furniture made in Canada and the other to obtain full particulars regarding educational motion picture films, portraying the making of furniture from the tree to the finished article. G. W. Gibbard, of the Gibbard Furniture Co., Limited, Napanee, Ont., was elected chairman of this committee.

Make Home More Attractive

The opinion was expressed that it was most important that Canadians in both rural and urban centres should feel a special attachment for their homes, as any nation, the citizens of which are homelovers, is bound to be prosperous, as well as contented and happy. Besides it was felt that if rural home life were made more desirable through the medium of an attractively-furnished homes, there would be greater joy in the family and farm life would have a stronger appeal.

The Business Profits War Tax Act was discussed and the opinion was expressed that in a general way it checked enterprise, in many cases taking away from industry money that was urgently needed for its expansion. In that way the Act was detrimental to the business growth of Canada. If this war tax were withdrawn it would lead to an expansion of business and increased revenue for the Government through the operation of a general income tax. A motion to this effect was unanimously carried and will be forwarded to the proper authorities.

Studying Labor Conditions

Jas. E. Ferguson, who had attended the meeting of the National Association of Upholstered Furniture Manufacturers, held recently in Buffalo, stated that the labor situation there was much the same as in Canada and that Professor Elliot, who addressed the meeting in Buffalo, stated that the general public was tired of strikes and that he looked forward to their gradual abolition because employers of labor and the workmen were getting closer together and also because no section of the community were studying labor conditions as much as the employers themselves. Manufacturers have awakened to the fact that they must introduce conditions which will be both favorable to labor and themselves. This opinion was endorsed by the Canadian furniture manufacturers who have been one of the first groups of employers in Canada to co-operate in every legitimate way for the betterment of their employees, with marked success, and they realize and have acted on the principle that industrial problems and labor conditions must be studied and dealt with by each individual plant.

Mirror Plate Situation Serious

Reports from all factories show large advances in lumber, finishing materials, upholstery coverings, and labor. The mirror situation is even more serious as not only have prices advanced enormously but plate glass is very difficult to obtain and there is practically no X.L. mirror plate obtainable. This was used in all the cheaper cases and means that British plate prices will have to be paid instead of X.L. for all qualities.

As an instance of how prices have advanced. During the last twelve months quartered cut oak has risen from $110.00 per thousand feet to $400.00 per thouand. Native hardwoods have doubled in prices in the last six months. These advances have been caused by domestic and foreign demands, which continue to be heavy. In 1914 turpentine was 54c per gallon, it is now $3.35 and shellac that was 18c per pound is now $2.25.

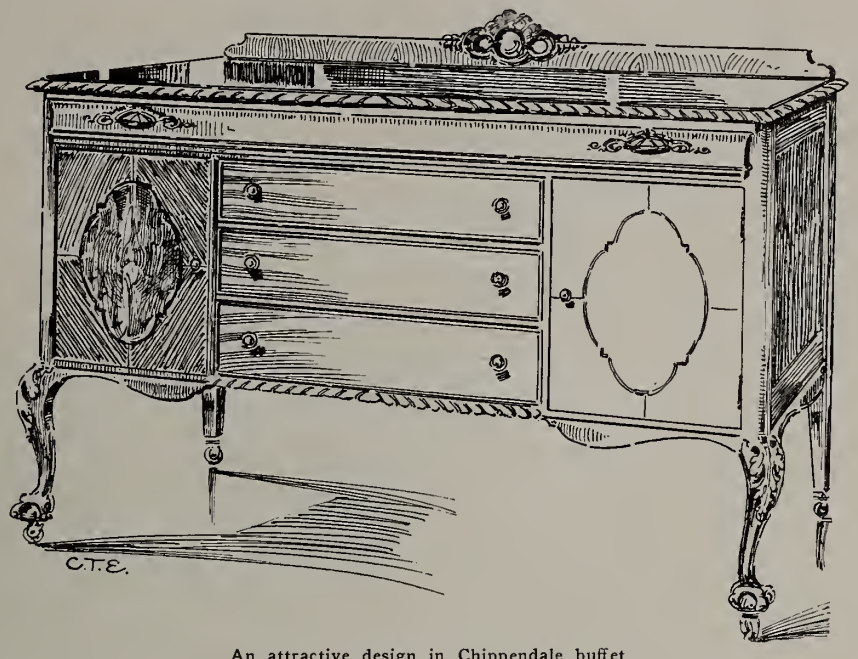
Large Volume of Orders

The volume of orders placed at the factories for furniture is unprecedented and as the supply of materials is uncertain it is impossible for manufacturers to quote prices for future deliveries, therefore, most of the furniture manufacturers, both in the United States and Canada, have been compelled to protect themselves by only accepting orders for future deliveries at prices prevailing at time of shipment. A few Canadian furniture men will only accept orders for goods that they can deliver in 60 or 90 days from date of order.

A tariff committee has been formed with the object of furthering the manufacture in Canada of all materials which can possibly be made in Canada. It is felt that many items that are being purchased in the States should be manufactured in Canada.

Safety League to Convene

The Sixth Annual Meeting of the Ontario Safety League will be held on Tuesday, April 13th at 9.30 a.m., following which will be a three day safety convention in the Banquet Hall of the King Edward Hotel, Toronto. Mr. J. T. Burke, Chief Inspector of Factories, Chairman of the sub-committee on papers, is arranging for papers on steam railroad hazards; elevator hazards; accident prevention in the pulp and paper industry; industrial dust; accident prevention in the rubber industry; plant sanitation; resuscitation; woodworking hazards; accident prevention in the steel industry; grinding wheels; hazards in grain elevators and cereal mills; accident prevention in the automobile industry; shop lighting; public utilities; shop safety committees and industrial relations and fire prevention, by men prominent in industry throughout the country.



An attractive design in Chippendale buffet

A Buffet with Chippendale Motif

Simple in Design and Construction—Attractiveness in Furniture Lines Assuming Greater Importance—May be Transformed to Other Adaptations

By C. T. Eichelsdoerfer*

A well designed piece of furniture has a strong appeal when on the floor of a furniture store and this attraction increases as the article is lived with and put to use. The buffet shown in the accompanying illustration is from a dining room suite designed in Chippendale motif. It is of simple construction, well balanced and proportioned and has a very practical arrangement of drawer and cupboard spaces.

Design is of greatest importance in the production of any line of furniture. This phase will assume greater importance in the demands of the near future. As competition becomes keener it will probably be the design and quality that will account for the popularity of any particular line. The limited supply and the strong demand which exists at the present time apparently suggests that anything in the line of furniture will be accepted and sell. This may be true to a very limited extent but the curtailment in the variety of patterns, which many manufacturers are making in order to stimulate production, has created a condition where there is a great similarity in the design of the different lines. As the prices of these items are increased from time to time, owing to the constant advance in the cost of materials and labor, they will lose much in selling qualities in the approaching competitive market.

The buying public, today, know and appreciate good furniture and are willing to pay the price. But at the figures that furniture is bringing it must be well made, well designed and look the part.

Never before has the practical designer had a greater opportunity to serve the producers of fine furniture and perhaps never before has economy been such a vital issue. The manufacturer must scrutinize every item of his production costs. The unprecedented values of cabinet woods and materials, also, the increased cost of labor, demand that the utmost care be exercised in their usuage to ensure a legitimate profit. This means that the designer must give value to his product by the quality of the design and at the same time must give heed to the construction and standardization of parts so as to facilitate production.

The buffet illustrated may readily be transformed into adaptations of other period designs and still retain the individual parts that will permit of its manufacture in quantities, thus increasing production. Through the designer coming in constant contact with the economics and methods of individual factories, he is in a position often to offer suggestions on vital issues pertaining to manufacturing problems. Perhaps having a larger perspective he may be able to help solve important points and his conscientious efforts often prove of value.

*Consulting designer, Shelbyville, Ind.

Large Car Order Placed

The C. P. R. recently placed orders for equipment which total roughly $15,000,000. These orders call for freight equipment, 2,500 sixty-ton box cars, 500 refrigerator cars, 500 automobile cars, 67 ore cars. Passenger equipment, 12 dining cars, 53 sleepers, 13 compartment cars, 24 baggage cars. The company will be able to execute a considerable portion of the orders, while the Canadian Car & Foundry Company, Limited, will get a large part of the total.

Selling Furniture on Sixty Day Basis

Open Price Method Proves Unsatistactory to Retailers—New System Eliminates Many Bad Features of Present Practice—Tends for Greater Stability in the Furniture Industry

By R. R. A.

The manufacturer of furniture is to-day surrounded by many uncertainties. Manufacturing costs are increasing continuously with the result that the furniture maker does not know with any degree of certainty what a particular article will cost him four or six months hence. On the other hand he finds an unprecedented demand for all his product. He is literally swamped with orders, so that in many instances his entire output is sold for months ahead. Naturally, in view of advancing manufacturing costs, he must, too, protect himself and to secure the replacement value of the materials used in producing the various items of his line, base the selling price on the market conditions prevailing at the time of delivery. That is only just and right. The retailer should not expect to purchase goods at a lower figure than it would cost the manufacturer to replace them.

Selling Methods Could be Improved

Is there not a better method of dealing with this problem? When business is conducted along these lines, the dealer thinks he has a grievance, and perhaps he has a real one. Owing to the abnormal demand, deliveries are slow and uncertain, which, when coupled with an open price, does not place the retailer in a very favorable position. In addition, slow deliveries and the possibility that only a small percentage of an order will be filled within a reasonable time, has a tendency to induce the retailer to place orders in excess of his requirements or to place a similar order with two or more firms, feeling secure in the belief that the whole order in any one case will not be supplied. This is a very bad feature and one that should be combatted by every means possible.

Another bad phase of the system followed by many manufacturers is that where they figure their production for six months or a year and then place their travellers on the road with instructions to divide this business up among the trade and then come in for the balance of the season, the manufacturer has lost touch with his customer. The traveller is really the mouthpiece or ambassador of the furniture maker and is able to explain to the retailer the exact conditions that exist at the factory, outline for him the material market and show him why prices are advancing, what lines are likely to advance most, why deliveries are delayed and in other ways keep him in close touch with conditions, so that he can figure with some degree of certainty what the immediate future has in store for his business. This information can be conveyed more satisfactorily and more impressively by personal representation than it could by fifty letters. Then again, the manufacturer has spent years working up close personal relations with his customer and should not at this late date be willing to lose the position thus gained. Personal contact is an asset which, if retained, will be found very valuable when present conditions change.

Sixty Day System Employed

A selling plan adopted by many American furniture manufacturers eliminates almost all the objectionable features outlined above. Under this system the output of a plant is calculated for a sixty-day period and each traveller given a part of that output as a quota to be divided among the dealers in his territory, with the distinct understanding that the stock will be shipped within the prescribed sixty days and at the quoted price. This latter is possible because the cost for the sixty-day period can readily be calculated as all the necessary raw materials should be on hand. Toward the end of this period the quota for the next two months is calculated and a new price fixed that will cover any increase in manufacturing costs. Then the process is repeated.

Say a furniture manufacturer wishes to adopt this system beginning April 1st. He would first strive to fill before that date as many of the orders on his books as possible. All the remaining orders would go on the April and May quota. The travellers would then be instructed to divide the surplus production over and above the orders booked for the months of April and May. As soon as the available amounts were disposed of, no more orders would be accepted. Then about May 15th the production for June and July will be disposed of for delivery during those months. Under no condition or at any prices would orders be accepted after the full quota for the period is sold, until the beginning of the next sixty days.

Advantages That Will Accrue

There are many advantages accruing when this system is followed and it might be well to mention a few of them. The dealers, knowing that all orders accepted will be delivered within the specified sixty-day period, will hesitate before placing orders in excess of their requirements or buying goods that they do not need. Thus overbuying, with the fictitious demand it creates, will be practically eliminated. It will curtail correspondence and put an end to a large number of letters and telegrams which are being received begging for the goods and asking when deliveries may be expected.

This system will enable goods to be shipped at a stated price instead of at quotations prevailing at the time of delivery, as is customary at present. There is no doubt that the practice of accepting orders with the price open has caused a lot of dissatisfaction and complaining on the part of the retail men, and they can hardly be blamed. At best it is a very unsatisfactory way to do business. Being in a position to accept orders with delivery and prices assured, would overcome this entirely and would win the friendship and goodwill, together with the hearty co-operation of the dealer. This is something that will stand in good stead when the demand for furniture is not so strong as it is at present.

Manufacturer in More Favorable Position

Doing business by the method described, will keep the manufacturer in very close touch with the conditions which exist in the retail trade. He will know that all orders received are real orders instead of working under the delusion that the orders booked for

twelve months ahead represent a true demand. He will be certain that all orders taken will be delivered and paid for. He will know when delivery will be made, the amount of money the orders total and when this money may be expected to come in.

Knowing that all the orders on the books are bona fide, places the producer in a very advantageous position when buying raw material and supplies. He will not be tempted to overbuy, neither will he be in the position where he is buying for orders that will not be filled and which in all probability would not be accepted if the goods were delivered. He is thus able to buy conservatively and is not forced to purchase needlessly large quantities at present high rates.

Why Not Adopt the Bonus System?

Human Nature to Respond to Proper Treatment—Divide Labor Into Groups With Standard for Each Division—Increased Earnings Provides Bonus—Manufacturer Benefits by Greater Production

By F. Moss

Every employer of labor, in general, and every furniture manufacturer, in particular, has been faced, during the past few years, with the rising cost of labor, but the actual increase in the daily wage roll has not been nearly so serious a problem to face as the decreased efficiency of the labor paid for. The many causes that might be given for this condition are beyond the scope of this article. The remedies suggested have been many, from "Let the Proletariat take over all industry" (Bolshevism) to "Let things alone. They will right themselves in time." (Inanimatism). I believe there is no such word in the dictionary but there ought tto be.

Give Labor Share of Increased Earnings

Conditions being as outlined and as it is recognized, generally, that labor is entitled to a larger share of the profit on the wealth it produces than has been customary for it to receive in the past, I will offer a few suggestions to the furniture manufacturer, or other woodworker, as to how he can increase the pay of his men and at the same time secure the increased production that will enable him to pay this additional sum.

Human nature being as it is (and even Woodworker's Unions are made up of human beings, although I once heard a furniture manufacturer say he didn't think so) any man or body of men will be glad to entertain a proposition whereby he or they can do better for themselves than they are doing at the time, or than they have ever done. If a man or a group of men find that any extra efforts on their part, or any better co-operation is promptly rewarded by increased pay, they will make the effort. This is proved by the fact that piece-workers almost invariably turn out more work per day than day workers.

Workmen Divided Into Groups

Very well, my suggestion is simply this that if you are not already doing so, you divide your men into groups and pay each group a bonus on any increased efficiency it shows. The exact method to be employed will have to vary with different factories and with different departments of the same factory. I will outline a sample of how this can be worked in a furniture factory, making a staple line of goods and with no very wide range of lines.

In the first place, the dividing of men into groups is a very simple matter and involves no expense and very little trouble. It is all done on paper. When paying a man on the swing or cut-off saws, you would charge his pay to Group No. 1, or breaking out group. When paying a packer you would charge his pay to Group No. 10 or 12 or whatever it happened to be, and so on through the whole pay roll. It is best to subdivide the pay roll as much as possible as it costs no more and is little, if any, more trouble.

The packing group, which we will call No. 10, and which is the easiest to check up daily will serve as an illustration. We will say that your daily pay roll in the packing room is $25.00 and that you are shipping on an average $1,000.00 of goods a day. Now if by better co-operation and a little more energy, the men can pack $1,200.00, they have actually earned $5.00 more. You perhaps cannot give them all of the $5.00 (because if they drop below the standard of $1,000.00, you cannot reduce their pay) but the point I want to make is, that if they can make the $1,200.00 the standard instead of the $1,000.00, and if you can get each group to do correspondingly well, you can well afford to pay the **whole of the increased earning of each group to the men,** because you will reap the benefit in increased production and reduced overhead charges.

Method Differs For Various Groups

Some of the groups will require that a different method be followed in ascertaining the relative value of the labor to the work done. For instance, in the veneer room. You make some goods that are all veneered, some with only a little veneering on them and some without any. Consequently the total cost of labor in the veneer room per day or month may have no fixed or fixable relationship to the total value of the output, and this condition may apply to a certain extent to every department or group in the factory. This fact, however, remains in all cases; that where you pay a man or group of men a certain wage, it is up to you to know whether that man or group of men is earning that amount or more. If they do more, pay them at least part of their extra earnings in the shape of a bonus. You will get increased production, your men will be more prosperous and better satisfied.

Increased Efficiency Should be Rewarded

It is impossible, in an article of this length, to go into the details of each group and work out a scheme suitable for each department. If any one interested in the working out of this idea will write the publishers of this journal, I will gladly furnish details or other information pertaining to its application to any group, department or factory or to answer any questions that the reader may wish to ask.

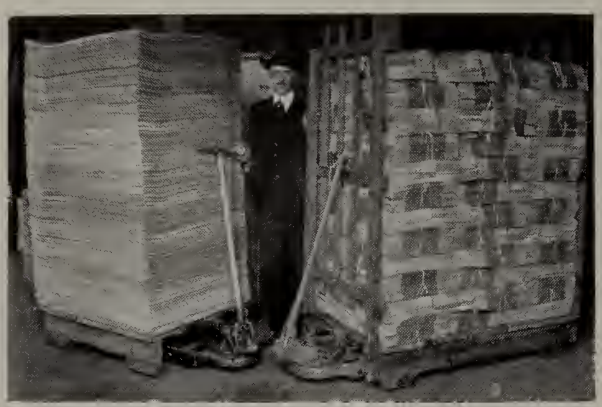
In the meantime the principle underlying the above suggestion is to encourage greater production by bonusing the men or groups of men who by reason of the expenditure of increased energy, greater willingness, greater efficiency or heartier co-operation, prove that they are worth it.

Greater Economy in Factory Trucking

How the Transveyor Truck Helps to Reduce Manufacturing Costs—Sufficient Trucks Readily Available—Large Loads Moved with a Minimum of Effort—Damage by Handling Almost Eliminated

By R. A. Johnstone

The high costs of labor and the demand for increased production and efficiency have focused the attention of many woodworkers on their factory trucking problems. Not only is labor costing more than formerly but there is a marked shortage of skilled hands; therefore any improvement in the method of moving stock through the plant that will either



"Tranco" trucks, manufactured by Chapman Double Ball Bearing Co., Toronto, hauling good loads

release one or more hands for productive work or will enable the mechanics to stick closer to their jobs should be welcomed on all sides.

In addition to the ordinary platform factory truck, which has been the standard in the majority of plants, lift-trucks and overhead carriers are being employed. The overhead carrier system, while applicable to any factory, is particularly adaptable for plants where the material handled is nearly all in long lengths, whereas the elevating truck and the platform truck give better satisfaction when the stock to be moved is in comparatively short pieces.

Platform Truck Being Replaced

As intimated, the ordinary type of platform factory truck has been the standard for years, but these are being replaced in many plants by the elevating or lift type of truck. It has been demonstrated that this latter type lends itself more readily to the solving of many of the inside transportation problems, and in addition offers many advantages that commend it to the progressive manufacturer.

Probably the first items to consider are the initial investment, labor and cost of upkeep. Instead of tieing money up in fifty or one hundred wheel trucks at $20.00 each, one lift truck, costing $125.00, with a sufficient number of cheap wooden platforms, at about $5.00 a piece, will do the same amount of work and give as efficient, if not a more efficient, service. Figuring on one hundred trucks it represents an investment of $625 against an investment of $2,000. Not only that but when this truck is employed, a considerable saving in upkeep expense will be effected, for instead of having to oil and repair a large number of individual trucks, there is one ball-bearing truck, that requires very little attention, to look after.

Sufficient Empties Always On Hand

Very few plants seem to have an adequate supply of trucking equipment, as empty trucks are usually at a premium. The result is that either some work must be unloaded on the floor or on to partially-filled trucks, or the workman is forced to pile his stock on the floor as he finishes his operation and perhaps carry it to the next machine. This is a needless waste of time and energy. The cost of the wooden platform for an elevating truck is so low that where this form of transportattion is employed a sufficient number of empties may be kept on hand. Someone may say that there is nothing, except the extra investment, to prevent a large number of wheel trucks being used. What about the storage? An empty platform truck requires as much room as a loaded one, while the platforms for the transveyor type may be piled in stacks in some out-of-the-way place until required.

The capacity of a transveyor truck is much greater than the older type. This is due to several reasons. The almost frictionless ball bearings, with which this truck is equipped, enable a heavy load to be moved with ease. One man can readily transfer a load that would require four or even six men to move with the ordinary equipment. This ease of operation enables the truck to be loaded to capacity, In addition,

Moving load of ten empty platforms

owing to its sturdy construction and ease of operation, a larger platform is usually built.

Regular System Employed

In his efforts for greater efficiency, the up-to-date manufacturer has, in many cases, adopted a regular inside transportation system with aisles or passages marked off by painted lines, regular parking areas and other features that tend to facilitate the move-

ment of stock and to reduce any confusion that may exist in the factory. The lift type of truck lends itself readily to a system of this kind; in fact, where it is employed, the handling of stock is almost automatically placed on a more efficient basis, for while a workman might be tempted to leave a loaded wheel truck in an aisle or passage-way, knowing that it could be pushed to one side, he would not be so ready to block the same aisle with a loaded platform, knowing that it could not be moved unless the lift truck were at hand.

Damage to Stock Reduced

The handling of the material is a very important item, especially when considered in relation to production. A lot of time is lost when the stock is unloaded on the floor and then later piled on a truck and unloaded again at its destination. By loading the stock in the first place on inexpensive patforms and then dropping the patforms and load in a storage or parking area, the work progresses through the plant with a minimum of handling, often enabling one or more stock handlers or truckers to be dispensed with.

Close quarters and lack of space do not prove a very great hindrance as the transveyor truck is constructed so that it will turn and manoeuvre around sharp corners and in very limited areas. Consequently the materials may be stored on platforms in a minimum of space and with a minimum of passage area.

The Warping of Kiln Dried Stock

Indicating How Allowing Stock to "Set" Equalizes Moisture Content of the Various Parts of Each Piece, Lessening the Tendency to Warp

By L. H. McDonald*

As it is now necessary to kiln dry nearly all the heavy lumber, I feel that it might not be amiss to call your attention to some of the difficulties that are often encountered.

A kiln of two-inch oak has been dried; samples are taken at reasonable distance from the end of the boards, and test shows 5% moisture. This material is run into the mill and worked up into pieces, as indicated in Figure 1.

Almost immediately they begin to warp. What is the trouble?

This factory had no trouble with the last run that was milled with 6% moisture content.

A more careful test will show somehting like the following: Take a test piece 2 in. x 6 in. and divide it up into sections as indicated in Figure 2.

Sections 1, 6, 13 and 18 show (say) 1%; sections 2 to 5 inclusive, 7 and 12, 14 to 17 inclusive (say) 4%; while 8, 9, 10 and 11 may show 10%. So, when you average it up, you only have 5%.

It is very plain to see what will heppen when you mill lumber in this condition, as per Figure 1.

Still you wonder why the other run that contained 6% did not warp. The reason for this was that the first run was taken from the kiln and not milled for some time, and the excessive moisture that was in sections 8, 9, 10 and 11 moved into the drier sections, and then the immediate outside may have even picked up moisture.

The second run was milled immediately and no chance was given for this equalization.

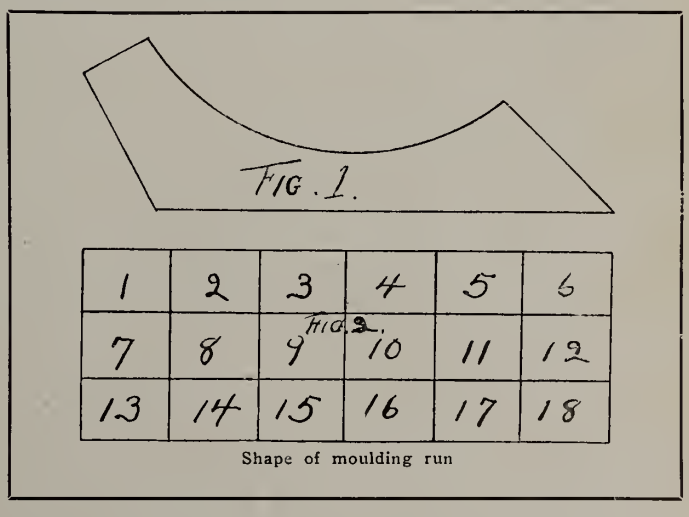
I know you are in a big hurry—the other fellow is after you for shipment—but you are much more certain of saving your lumber and pleasing your customer if you wait a while.

I cannot help calling your attention to the piling. Usually the same 7/8 in. piling sticks are used. This is permissible, but be careful to maintain air spaces, so that the air may have free passage up through the loads of lumber. That is more important than with the thinner stock, for the reason that this thick stock is not subjected to as great a circulation, and if the entire car is not subjected to the same conditions, the retarded sections will not dry as fast as the others—for instance, the ends and sides of car.

Boards that are warped should be loaded in the bottom of the car, and plenty of sticks should be used—say not less than four or five for sixteen-foot lengths.

In drying any kind of lumber, it is bad practice to allow temperatures to go up and down. This practice will prove very disastrous to heavy green lumber.

No doubt you remember the time when you connected a dry kiln up with the exhaust line from the engine and "let her go at that." The only heat you kiln ever had was when the engine was running—off every night and all day Sunday. Your memory tells you that you got along in great shape and made good furniture.



Shape of moulding run

But times have changed. If your memory serves you right, it will tell you that you bought that lumber one year air-dried and then kept it one year on your yard before you put it in the kiln.

So, when you remember how you did "once upon a time," remember the whole story, for you are headed for sure ruin if you attempt to dry the heavy lumber you now have in the same manner as you did in what we are inclined to call "the good old times."

*Vice-president, National Dry Kiln Co., Indianapolis, Indiana.

The Manufacture of Wooden Clothes Pins

These Small Articles Produced in Large Quantities—Strong Export and Domestic Demand—Possible Market in the United States—Description of Operations

By H. A. Rolphe

Just at the present time clothes pins are scarce and in good demand and as a consequence are bringing a comparatively good price. Slotted pins that formerly sold for fifty cents a box of five gross are now bringing one dollar and twenty to one dollar and thirty cents a box.

When one considers the number of factories making this commodity and that one hundred thousand pins a day is not a large output for such a plant, one may well wonder where a market can be found for this enormous number of pins. Not counting the export trade, which annually takes a large proportion of the output, there is a strong, steady local demand. Clothes pins will break, become lost or be carried off by children. Replacing these losses together with new business is responsible for the local demand.

Shortage in American Market

It would appear as if there are good possibilities in the manufacture of this commodity. At the present time there is an acute shortage of pins in the American market and high prices are being received. Many American clothes pin factories, which closed during the war, have not started up again because their supply of timber is depleted. What is more probable than that Canada, with her plenteous supply of raw material, will be able to supply an ever increasing quantity of pins to our friends south of the border.

Some attempts have been made to introduce an all wire pin but the wooden article easily maintains its supremacy. The two varieties in greatest demand are the slotted and spring types. The spring type consists of two pieces of wood suitably grooved and bevelled and then connected together with a wire spring. The slotted pin is made in two styles, the flat or square and the round.

Made on Specially Equipped Stickers

The flat type and spring pin are no doubt made by feeding short blocks of wood, edgeways, through a specially fitted sticker and then running the formed pieces through a fine gang saw which rips the pins to the required width.

They are then run to a heated timbler where they are polished and dried. Then sorted and packed and are ready for shipping. In the case of the spring pin the two pieces of wood and the spring must be assembled before packing, while this operation may be performed automatically on specially constructed machines, the probability is that it is done by boys and girls.

Pins Made from Logs

The round pins are manufactured differently. If the pins are being made from round stock the bolts are first cut to about 16 in. long and sawn into ¾ or ⅞ in. boards on a suitable bench saw. If made from lumber the stock is first cut to the 16 in. lengths. The next operation is slitting or ripping the boards. This is usually done on a roller or endless feed gang saw carrying twelve or more fine blades. If this machine will handle short lengths the boards, not the bolts, may be cut to five or five and one-half inches as required before being ripped thus saving the next operation.

As many machines will not handle the very short pieces the next operation is cutting the small squares to the required length. This is usually done on a cylinder cutting off machine. The operator merely places the lengths on the cylinder or drum, fitted with cleats, which carries the pieces under a gang of four saws. These saws are set to cut the length required and produce suitable planks with nicely squared ends.

Automatic Lathes Increase Output

The blank now go to the lathes where they are turned to shape. These lathes may be either automatic or hand fed. The hand fed machine operated by a good man, is capable of turning out about 100 gross a day. The automatic machine has about twice this capacity and has in many instances superseded the simpler lathe. In this machine the square blanks are carried to the spindles on an endless apron from which they are taken and turned at the rate of from 100 to 125 per minute. The slower rate produces a cleaner, better finished product.

The slotting of the pin is the next operation. This is done on special machines. The turned pieces are fed into a hopper and are taken by a sliding carrier past the saws or cutters which make the cut, smooth its sides and flare the outer ends, discharging them fully slotted. The slotters are made single, having one saw and feed arrangement or double with two hoppers, saws, and feed works. The capacity of the single machine is 100 to 120 pins a minute, while the larger machine just doubles that output.

Dried in Large Bins

As the stock used is usually green the common practice is to dry the pins in large bins. These bins have slatted bottoms through which a strong current of warm air is forced. As the pieces are small the drying is quickly accomplished. From the drying bins the pins are carried to the tumblers where they are polished, this completing the product. The writer does not see why a hot blast could not be sent through the timbler thus drying and polishing in one operation.

In an up-to-date plant the pieces would be carried from one machine to another by belts or other forms of equipment, perhaps combined with large storage bins with hopper bottoms situated behind or near each machine. There are so many pieces to be handled that any device that lessens the labor makes a considerable reduction in manufacturing costs.

The wood employed is common hardwood such as beech, birch or maple.

Mill waste is carbonized and turned into good, dense charcoal in six hours by a new process, the economy of which has been demonstrated recently. A closed air-circulating system includes a fan, a stove for heating the air pipes, a condenser and an electrical precipitation unit for extracting the liquid hydrocarbons, and a brick-lined retort, 14 ft. high and 3½ ft. in diameter, in which the waste material is placed.

Reducing Trim Saw Waste to Minimum

Every Inch of Lumber Worth Real Money—Careless Breaking-out Responsible for Large Loss—Handle Each Board Separately—Extra Swing Saw Advisable

By Albert Hudson

The trim saw or swing cut-off in the breaking-out room accounts for a good percentage of the lumber waste that takes place in any woodworking plant; in fact I do not think that there is another machine in the factory where money may be saved or lost in such large amounts as at this machine.

A few figures may be taken as an example. Two men are cutting stock in a furniture factory. Each man cuts about 3000 ft. a day. They are paid $4.00 apiece for nine hours' work. The stock, which is being cut, we will figure at $75.00 per M. feet, (a very low figure at present prices.) We then have the following equation:—Two men x 3000 ft. x $75.00 equal $450.00. $450.00 represents the value of the stock cut each day by these men at a labor cost of $8.00.

Some Waste Unavoidable

The unavoidable waste may be 900 ft. or 15 per cent., which would be worth $67.50. Now this amount of waste is probably covered in the cost sheets. Suppose that one of these cutters is careless, does not use his head as he should or through plain inefficiency is not able to get the most out of a board, it can be readily seen how easily the waste might jump to 25 per cent. It is much easier for the proportion of waste to increase than it is for it to be held at a minimum amount. Should the waste jump to 30 per cent., the additional loss would amount to $67.50 more daily.

We find some swing-saw men, who go on from day to day butchering the lumber and not giving any thought to the value of the material they are handling. A man of good, sound judgment should be placed at every machine in this department. The labor cost in comparison to the value of the lumber cut is so small that it is not profitable to employ any but the most efficient hands on the swing-saw. Good men, as a rule, command good pay, but in this particular position they have the very best chance to earn all they may receive.

Stock Lost in Trimming Ends

Trimming waste should be cut down to an irreducable minimum. The amount of stock cut off in squaring the ends of the boards might well be watched. I have seen a swing-saw operator cut a 12 in. length off a 9 in. oak board when the end was perfectly sound. This is simply ridiculous. Oak to-day is worth around $425.00 to $450.00 per M. feet in the pile at the factory yard. That means that 1 in. cut from the end of a 9 in. oak board costs about 3c, so that that amount of money is actually thrown away for every inch cut off or wasted in breaking out 9 in. stock. Is it worth looking after? Some waste is unavoidable but the workman should be impressed with the value of the wood and instructed to save every inch possible.

The lengths of the boards and the stock lengths may conflict to the extent of from 3 in. to 5 in. waste on the last cut. Take a total end waste of 5 in. on stock of an average width of 10 in. and averaging 15 ft. long. This figures out to 3 per cent. waste and may be said to be unavoidable or legitimate waste. How easy it is to waste an additional 5 in., bringing the loss up to 6 per cent. Eternal vigilance is the price of economical cutting.

Not Advisable to Cut Number of Boards

In some factories a stock cutter may be seen piling three or four boards on his bench and cutting them in one operation. If the stock were absolutely clear and of an even length this might be permissible, but with the ordinary run of lumber it is a practice that should be condemned. While this method may increase the capacity of the machine, does it really pay? The operator is, certainly, not able to cut each individual board to the best advantage.

The superintendent of a certain plant, seeing that the work was piling up at the swing-saw, suggested to the operator that he cut out five or six jobs at once, and in so doing pile three or four boards on his bench and thus increase production. This method relieved the congestion in this department, but with an unlooked for result.

After carrying on in this way for a while, it was found that many of the lengths cut were unfit for further use owing to the presence of knots, shakes, etc. Working under the old system of handling each board separately the operator had a chance to cut out clear material. By making two cuts close to a knot or other defect, the bad spot could be eliminated with very little waste, but when working a number of boards together, these spots were hidden. In addition, it was found that trying to cut out a number of different jobs at once was not only wasting valuable time but made for confusion as well.

Lumber is too valuable to be handled carelessly or wastefully. It would pay many a manufacturer to instal an extra swing cut-off in his breaking-out department so that the men cutting up the stock could give a little more thought and care to their work, thus securing the most from any board and at the same time reducing the waste to a negligible quantity.

Succeeds in Securing Mirror Plate

The head of a large Grand Rapids furniture factories recently made a trip to Europe to purchase a quantity of mirror plates. According to the latest report he was eminently successful in his mission having placed several large orders for plate, both silvered and unsilvered, with some Belgian manufacturers. Deliveries are expected to commence in the near future.

The Canadian furniture men are being seriously handicapped by a shortage of this commodity. Does not this suggest a way out? Why couldn't the Canadian furniture manufacturers co-operate and pool their orders and either work through the F. M. A., or send an independent buyer to the Continent to purchase the much needed glass. If an American manufacturer is able to take this step surely it is not too big an undertaking for a number of Canadian furniture manufacturers.

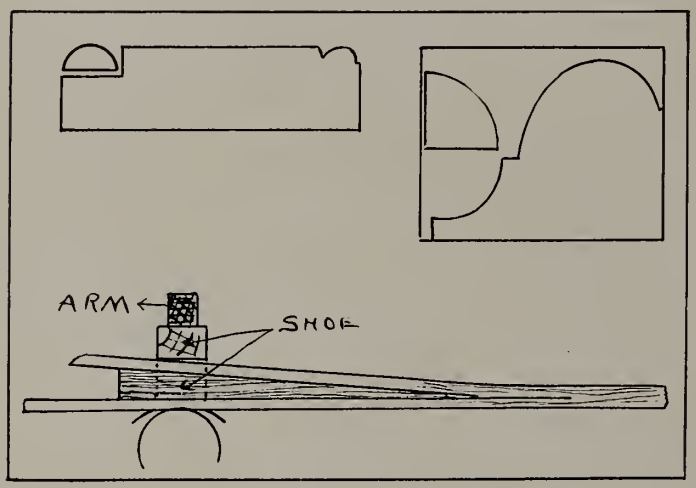
Manufacturing Costs Lowered by Sticker

Machine a Money Saver in Capable Hands—How One Manufacturer Used It Advantageously—Capable of Wide Application

By D. L. W.

The number of operations that a capable, efficient mechanic can perform on the sticker is almost unlimited and, with proper handling, this is one of the most useful and profitable machines in the woodworking factory.

A well known woodworker recently received a contract for a large quantity of 3 in. by 1/2 in. and 4 in. by 1/2 in. dressed on the face. The usual method of getting out this stock would be to run the lumber through the resaw and then dress it on the planer. Another method often followed, especially in box factories, would be to dress the thick stock on both sides on a sticker or inside moulder and then split it on the resaw. As the quantity of lumber involved was considerable the second handling of the stock, necessitated by using two machines, added condesirably to the cost of manufacturing, both with regard to the additional labor entailed and the time required putting it through the second machine.



How sticker may be used to advantage

It was here that the sticker demonstrated how it can save labor and increase production on occasion. The side heads were removed and two circular saws placed on the spindles, being held tightly by suitable collars. Two sets of saws were provided, the smaller pair being used on the narrow stock.

The shoe was made in two pieces the back section extending as far as the inside head. It was designed so that it would lift the upper half of the board as it cleared the inside saw, and at the same time maintain a pressure over the bottom head so as to ensure that the underside was being surfaced.

This rig worked very satisfactorily and made quick work of the contract. The saving in time and labor easily amounted to fifty per cent. When this saving is considered together with increased output and overhead the real value of the saving will be realized.

The same idea may be employed in other ways. For instance, when running rabbeted stock for wire window and door screens it is often possible by using a shaped knife on the top head and a saw or splitter knife on the inside head to cut a half round or other small moulding from the stock ordinarily removed when making the rabbet. This is like money found as the stock and running does not cost practically anything except the added work in setting up.

While this idea is possible of wide application as it may be worked out when running a moulding that is thin on the edge, yet a considerable amount of judgment must be exercised. As it would not be wise to work this scheme indiscriminately, on a short run, or where the saving effected is almost negligible.

Many operators when running a moulding that is thin on one edge often cut a bevelled piece from the corner which would be removed in making the thing edge and later run this into a small moulding. When lumber values are so high every effort should be made, even at the cost of extra labor and handling, to extract the fullest value from every foot purchased.

Suitability of Various Hickories for Vehicle Manufacture

The principal species of hickory are divided botanically into two groups—true hickories and pecan hickories. True hickories include shellbark, shagbark, mockernut, and pignut or black hickories. Pecans include bitternut, nutmeg, pecan, and water hickories.

The chief difference between true and pecan hickory, as shown by tests at the Forest Products Laboratory, is in toughness or shock-resisting ability. This is the property which is so valuable in wood handles and vehicle parts. In this property true hickories are far superior to the pecans.

The strength properties of pecan are somewhat in excess of those of oak or maple, and for such articles as handles and buggy spokes, carefully selected woods. In heavy wagon parts, such as axles, spokes, and felloes, maple and oak are reputed to stay in place better than hickory. Except in case of extreme shortage of maple, true hickory, and oak, it would probably be inexpedient to use pecan hickory for these heavy parts.

The sapwood or white wood of hickory, which is usually preferred by the trade, is the better wood in young, thrifty trees; but in over-mature trees it is inferior to the heartwood. A red color does not necessarily make sound hickory unsuitable for vehicle stock.

A more useful criterion than color is the proportion of summerwood, or nonporous wood, in the annual growth rings. In hickory stock intended for the more exacting uses, the nonporous wood should form at least one-half and preferably three-quarters of the annual ring; and the remaining part should contain very few pores. A further precaution to be observed is that the nonporous part of the annual ring should be hard and flinty.

The best criterion of the strength properties of either true or pecan hickory is the weight of a cubic foot of the dry wood. This weight should not be more than 10 per cent. below the average for true hickory; or not less than 45 pounds per cubic foot of oven-dry wood.

Retires from McLagan Company

H. S. Robertson, Stratford, Ont., who for nearly seven years has been connected with the McLagan furniture interests in Stratford and Meaford, recently retired from active participation in the affairs of the company. Mr. Robertson succeeded Chas. Farquharson, in 1913, as secretary-treasurer of the Geo. McLagan Furniture Co., Limited, holding also the position of director of the Stratford Chair Co., and the Classic Furniture Co.

In 1918 upon the death of George McLagan, of whose estate he was appointed trustee, he became vice-president and treasurer of the two Stratford companies and also president of the Meaford Manufacturing Co. In the re-organization which took place last October he was made a director and secretary-treasurer of the new amalgamation—the McLagan Furniture Co., Limited.

H. S. Robertson, Stratford, Ont.

Mr. Robertson is a member of the Advisory Council of the Furniture Manufacturers' Association of Ontario and Quebec, and was recently elected chairman of its Credit Section. He has for many years taken a deep interest in the Y. M. C. A. and similar public interests and is at present chairman of the Collegiate Institute Board. In reply to a query he stated that he had no immediate plans, other than taking a needed holiday following his strenuous work of the last two years.

Chas. E. Casey Succeeds Brother

Chas. E. Casey, brother of the late Mr. M. E. Casey, is now manager of the M. E. Casey Company, Limited, Montreal. This firm represents the P. B. Yatets Machine Co., Limited, of Hamilton, Ontario, and Beloit, Wisconsin, manufacturers of woodworking machinery. Associated with Mr. Casey are Horace Bennett, who looks after the company's business in the Maritime Provinces, and J. W. H. Pontbriand, who covers Quebec and Eastern Ontario.

You cannot make good furniture out of green lumber.

Midland Woodworkers to the Front

The Midland Woodworkers, Limited, Midland, Ont., were re-organized in October last and took over the business formerly operated by the Georgian Bay Shook Mills. The new company is under entirely new management, the following being the officers: President, A. H. Vanderburgh, of Toronto; vice-president, W. H. Firstbrook, of Toronto; secretary-treasurer, R. H. Scrivener, of Midland; director, W. Benson, of Penetang, and managing director, Fred M. Beatty, of Midland. It was decided to discontinue the manufacture of box shooks as carried on by the old company and to devote the plant to the making of doors, sash, mouldings, veneer doors and veneer panels, general millwork and hardwood flooring. A heavy stock of lumber, including hardwoods, pine, spruce, hemlock and B. C. lumber is carried, and the plant is in shape to make up almost anything required in millwork. The plant is splendidly outfitted with machinery and with the addition of one or two machines which they are putting in, will have one of the best equipped mills of its kind in Canada. It is planned to develop the business as much as possible, particularly in the hardwood flooring department.

F. M. Beatty, Midland, Ont.

The capacity of their door plant at the present time is about 250 doors per day, and it is planned to double this before very long. The department for the making up of veneer doors is well equipped with modern veneer machinery and turns out a first class article in every respect. This department uses Perkins' vegetable glue exclusively. The company has one of the finest waterfronts on the Georgian Bay and is able to unload millions of feet direct from the lumber barge to the lumber pile, which gives them a very low lumber cost on stock brought in by water route.

British Columbia box men have been urging their customers to purchase their requirements early and the results achieved will forstall the possibility of serious shortage of fruit containers in the B. C. districts.

Lining Up the Drum Sander

EVERY sander man has his own method of lining up his sander, consequently there are many methods in use. The following method has been employed by an old-timer for years and is claimed to be a quick and sure method of securing the desired results.

First add an extra straight-edge to your usual equipment of one long straight-edge. The time this will save will soon pay for the small extra cost as when two straight-edges are used, the entire line-up can be made without changing the original position of these tools, thus saving the great amount of time and accuracy lost in constantly shifting one straight-edge from side to side.

Now go about your lining-up in the following order—bed plates, drums, bottom feed rolls, top feed rolls and pressure rolls. If machine is set up level, lining-up bed plates should never be necessary. However, if holding screws have worked loose, lower drums below bed level, and lay each straight-edge lengthwise with the bed, edge up, placing cards between each bed plate and straight-edge. Adjust each plate from alternate sides until the cards are all held equally tight. Then draw the screws up and test the cards again to make sure the tightening has not drawn one end of any plate higher than the other.

Next, pull out cards without changing position of straight-edges. Loosen the two set-screws in the stud of each drum box, and turn the screw that the studs rest on until each end of the drum felt firmly touches the straight-edge. Draw up the set screws all around, and your drums are in line. It is better to make line-up with felt rather than with sandpaper, because the paper might be a little loose.

Now insert the eight cards as before. Loosen feed roll wedge screws and turn adjusting screws to the right to raise feed rolls level with the straight-edges. Tighten wedge screws to lock adjustment. Feed rolls are now lined up with drums and plates at a level with the thickness of the cards above them, which is their correct average feeding level.

You are now ready for the upper adjustments. Go about these exactly as on the lower, only placing cards above instead of below straight-edges, and two cards under the pressure rolls, so that when the top is lowered both feed and pressure rolls will touch the cards. Then line up first the feed and then the pressure rolls, exactly as you have the lower adjustments. Put paper and drum belts on and run your machine free for a few minutes to be sure everything is in good shape.

Now make final adjustments according to the stock to be run, lowering drums to level of cuts, as they probably will be too high, having been leveled with the felt.

If, after years of use, correct adjustments do not stick, do not forget that you can take-up thread or bearing wear by means of take-up collars provided, or by substituting thinner oil felt in the split boxes.

Australian Requirements in Wood Turning

Parts for piano-players, rolls for typewriters and skewers for cotton mills are not marketable here. Piano-players are not made here, and spare parts are supplied by the makers of the players. Typewriter rolls are also supplied by the makers of the various machines on the market, as the outside rubber vulcanizing process cannot be done here. There are no cotton mills in Australia and therefore no call for skewers.

Pill boxes are made locally but of poor quality and finish compared with the imported articles, the trade in which is largely confined to the products of one United States house. If Canadian products can compete in quality and factory price with the product of this firm, there is a prospect of good business, but this can only be definitely determined by the production of samples.

Draw pulls, rolling-pins, rake teeth, rack pins, and, to some extent, floats for fish nets, hubs for carts and short handles for tools (not hickory), are made locally. Hickory handles are the most popular and are mostly imported from the United States.

Turnings for baby carriages, croquet mallets and stakes, hickory handles, wood faucets, pill boxes, and hubs for carts are the articles for which there is a market in Australia, provided Canadian quality and price (f.o.b. ocean port) are competitive with those of United States manufacturers.

If Canadian manufacturers will supply particulars of quality and prices of the lines above indicated, the Department of Trade and Commerce, Ottawa, would be in a position to approach dealers and definitely ascertain their selling possibilities.

The present net customs duties on woodenware of the kind described are given below, but are subject to alteration in the impending revision of the tariff:—

	Uuited Kingdom	General
Hubs, elm, with or without metal bands	16½%	16½%
	1s. 3d.($0.31)	1s. 3d.($0.31)
Tool handles of wood, attached to tools	Free	11%
Tool handles of wood unattached	22%	27½%
Felloes of hickory, cut, shaped or bent, plain, in the rough	16½%	16½%
Rims of hickory, bent, squared, plain, in the rough	16½%	16½%
Spokes of hickory, rough-turned but not shouldered or tenoned	5½%	5½%
Spokes of hickory, dressed, 2-inch and under in diameter	16½%	16½%
Spokes, dressed or prepared (not being hickory) same size, per 100.	12s. 6d.($3.04)	12s. 6d.($3.04)
Bars, shaft and whiffletree	27½%	33 %
Poles and shafts, in the rough, bent, undressed or dressed	27½%	33 %
Other articles of wood	33 %	38½%

Keeping Track of Moulding Lengths

The proprietor of a large planing mill has worked out a good scheme for keeping track of the different lengths of moulding in the storage bins. He manufactures a considerable amount of various mouldings and usually has a large stock on hand. This he stores in the ordinary form or rack or bin. He has boarded up the sides of each bin, stating that this not only prevents the shorter lengths from working into other bins but keeps the moulding straighter and cleaner.

The scheme adopted is to paint the ends of the pieces different colors, say the 12 ft. lengths black, 14 ft. green, 16 ft. red and so on. Some of the advantages accruing from this system are: the amount of material in the bin is readily calculated, any lengths desired are easily picked out and a glance at the bin shows how the lengths are running and thus preventing the accumulation of any one length.

Those men who are not troubled with taxes are taxed with troubles.

Uniform Method of Costing Box Lumber

Many Different Ways of Figuring Material Costs—Inventory System Involves Guesswork —Every Advantage Should be Taken of Increased Lumber Values

By J. C. Heath

The subjects of a uniform system of cost-accounting or cost-finding for box factories has been engaging the attention of the more progressive box manufacturers for the last few years. As far as the Canadian industry is concerned, very little, if any, progress has been made along this line. One of the prime essentials of any such system is that a uniform method, of computing the amount and value of the lumber that enters the plant, be employed.

There are five general methods of valuing the lumber used in producing boxes. Some of these are so uncertain that the manufacturer employing them is practically forced to do a lot of guess-work and is not in a position to take full advantage of the fluctuations of the lumber market. These five methods are briefly outlined as follows:

The first plan is where an inventory is taken once or twice a year. Under this scheme the owner does not know, until this inventory is complete, whether he has been making a profit or not; in other words, the manufacturer, who follows this system, works in the dark between inventories. Of course, he has a general idea as to his costs, but his selling price is usually influenced by what the buyer says is fair. He endeavors to secure the market price, but if he thinks the occasion demands it, this manufacturer is prepared to make a drastic cut. The prices are based on what has gone before and the profits that have been made in the past. When conditions are as at present, with lumber values increasing, labor clamoring for higher pay and shorter hours, not to mention reduced efficiency, such a cost-finding method involves a considerable amount of guessing.

Second—Other box manufacturers may have foreseen, to a certain extent, the present increase in lumber values or, as a matter of policy, have secured a supply of standing timber. In this case a sawmill is operated in connection with the box plant. As all lumber manufacturers make a profit on the timber they cut, why should not the box manufacturer do the same? Supposing operating costs and stumpage values are such that the lumber cut costs $30.00 per M, if this stock is worth $35.00 in the open market, why should it not be billed to the box factory at the latter figure? The difference of $5.00 would then be credited to the lumber manufacturing account. If a box factory cannot bill its own lumber at market quotations and make a profit, something is wrong, and under ordinary conditions, where it would be forced to buy in the open market, its operations would be shortlived. Any box maker, who cuts his own stock, should bill the lumber to his plant at market value.

Third—There is a plan whereby the box maker keeps regular lumber accounts but bills into the factory the cheapest lumber in the yard until such stock is exhausted. As an illustration, if 100,000 ft. were purchased at $26.00 and another 100,000 ft. at $30.00 regardless of the fact that the present value of the stock is $30.00, the first lot would be billed in at $26.00 until exhausted, and then assuming that no further purchases had been made, the $30.00 stock would then be charged up. This system eliminates the likelihood of selling below the actual cost of production just as long as lumber values continue to increase, but would not allow the manufacturer to take advantage of his shrewdness in buying and the increase in lumber values. If prices weaken, such a factory would have some trouble disposing of the stock purchased at the higher figures. This could only be accomplished by selling below costs or scaling down the inventory values. The true costs may be known at all times but the criticism is that on a rising market, such a system does not enable the manufacturer to take advantage of the increased values of his stock, while on a declining market he must accept a loss or re-scale his values, which amounts to the same thing.

Fourth—Then again, there are others who know their true costs but bill their lumber to the plant at the average cost. If the factory is one which is purchasing material continuously, this plan will work out very satisfactorily, for the average purchase price will be fairly close to the average replacement value. If, however, this practice is followed by the manufacturer who purchases his lumber only at odd times, it would not allow for increases or decreases in lumber values, and would not encourage that manufacturer to quote market prices, assuming that lumber values had advanced since his last purchase. If the entire year's requirements are bought in one or two lots and the market rises, the average cost of such purchases would not represent the replacement value. The opposite holds true on a declining market, for he would not be able, owing to competition, to take advantage of the average high prices paid, and might be forced to sell at an actual loss to secure business. This is another instance where a manufacturer should take full advantage of market fluctuations and his shrewdness in buying.

Fifth—This is probably the ideal plan and is the one that should be followed by all box manufacturers. If this were done, it would to a large extent, eliminate price-cutting and would prove a good foundation for a uniform cost-accounting system in this industry. This plan consists of billing the lumber into the factory at its present replacement value. If the average cost of lumber in the yard is but $29.00, and the replacement value is $32.00, the lumber should be billed at the latter figures, for if it were necessary to purchase in the open market, the latter price would have to be paid and the lumber charged accordingly. The difference between the price paid for the material and the price at which this stock is charged to the factory, would be taken care of in the profit and loss column.

Someone may say that this plan is all very well as long as values are increasing but if the market were to break and prices decline, replacement values would be less than the prices paid for the material. This would mean a loss to the manufacturer. Undoubtedly this is true, but, assuming that lumber prices decline and replacement values be less than actual cost of production, the manufacturer would still be in direct competition with other box men who had made late purchases and who would thus be in a position to sell at a profit based on lower lumber costs.

This then leads into the question of supply and demand.

If this latter system were followed by all box manufacturers, destructive competition would be supplanted by constructive competition. Competition of service to the customer and competition of quality would be the controlling factor in selling boxes rather than competition of price alone. This may be an ideal condition but it is not impossible of attainment.

Holding Power of Hammer-Driven and Screwdriver-Driven Screws

Special strength is often desirable in the joints of wooden boxes; and one of the ways of securing extra holding power is to put the boxes together with screws instead of nails. It takes longer to put in a screw with a screwdriver than it does to hammer in a nail, but that is part of the price that must be paid for a stronger package. Now it has become rather common practice in box making to try to get the holding strength without paying the price. Screws are used, but they are hammered in nearly all the way and given one or two turns with a screwdriver.

The Forests Products Laboratory has made a series of tests to secure data on the holding power of wood screws when driven their entire length with a screwdriver and when hammered almost all the way in and then given a turn or two with a screwdriver. No. 12 wood screws, 1.75 inches long, were driven one inch into a hole ⅛ inch in diameter bored into the side grain of the wood. This is the distance No. 11, No. 12 and No. 13 wood screws are driven into the side grain of the sides and ends of packing boxes having ¾-inch tops and bottoms. The tests were made by a direct pull on the heads of the screws perpendicular to the surface of the wood until the maximum load was reached and the screws pulled from the wood.

The results of the tests are given in the table below:

Results of Tests

Relatively holding power of wood screws, No. 12, 1.75 inch long, driven one inch in holes ⅛-inch in diameter into side grain of the wood, driven entire length with a screwdriver and driven entire length with a hammer, except last turn, which was made with a screwdriver.

	Pounds per Screw	Average Per Cent
Basswood:		
By screwdriver	478	100
By hammer	281	59
Yellow Pine:		
By screwdriver	1,144	100
By hammer	681	60
Red Gum:		
By screwdriver	687	100
By hammer	403	59
Birch:		
By screwdriver	841	100
By hammer	570	58
Total Average:		
By screwdriver	788	100
By hammer	484	61

Though these tests are not conclusive in themselves and should not be regarded as showing definitely the holding power of wood screws, or their relative holding power in the various species of woods, nevertheless they confirm results obtained from many other tests made at the laboratory on boxes and on the mechanical properties of various woods, which indicate that hammer-driven screws have less holding power than screwdriver-driven screws. The use of hammer-driven screws, therefore, is hardly justified; for if the screwdriver-driven screws give an excess of holding power beyond what is required in a box, it is practical economy to reduce the number of screws used rather than to hammer-drive the same number.

Saws Nine Feet in Diameter

Two large saws were recently manufactured by Henry Disston & Sons, Inc., of Philadelphia, Pa. It is claimed that these are the largest circular saws ever made. They are of the spiral inserted tooth type, and are to be used, by a well-known concern in the west, for cutting shingle blocks from the large trees of that section.

Each of the new saws measures 108 inches (9 feet) in diameter, and in the rim are inserted 190 teeth. One may gain some idea of so tremendous a saw by

Note height of man compared with the saws

comparing it with a 54-inch saw, which is large as we ordinarily think of the term. The 54-inch saw requires for its making an ingot of steel weighing approximately 180 pounds and its weight when finished is about 125 pounds. The 108-inch saw started out as an ingot weighing 1,140 pounds, and after reheating, rolling and trimming, the remaining weight was about 795 pounds. In size, a 54-inch saw is apparently just half that of the 108-inch one, but actually the 108-inch one is four times the size of the former, as a measurement of square inches of surface will show.

In the making of large circular saws, this firm have had a long experience. As long ago as 1876 they made one 100 inches in diameter for exhibition purposes. Some years after they made another 100-inch saw for cutting stone, each tooth of which was studded with a black diamond to give the necessary cutting edge.

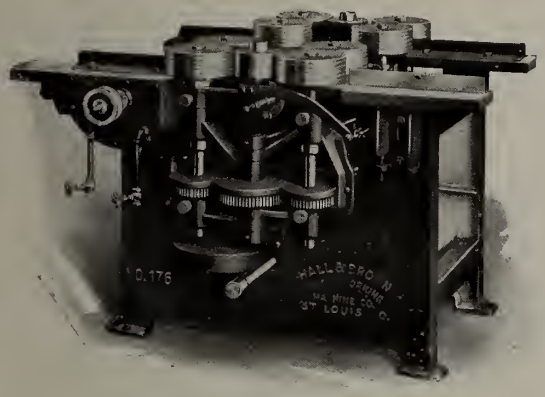
To fully appreciate one of these immense saws, one must see it in action; starting off slowly, the speed gradually increasing, the humming attaining a higher and higher pitch, until full speed is reached, at which time the teeth are travelling about 130 miles an hour. It is then that the forcefulness of this flying mass of toothed steel becomes strikingly impressive, and the sight of this huge saw, resistlessly and quickly cutting an immense log, is one to be long remembered.

A lot of heat goes to waste through the exhaust pipes of steam engines that might be saved and used to advantage.

Machinery & Equipment

Power Feed Box Board Matcher

A simple and efficient box board matcher is found in the Hall & Brown, No. 176. This machine is capable of matching and gluing, if required, box boards at the rate of fifty feet per minute. If specially ordered can be had with two feed speeds, namely 50 and 70 feet. The feed is a new type, being driven from feed shaft by cut steel spiral pinion and cast iron spiral gears. This insures a powerful and positive drive at all times. The rolls, which are 8 in. in diameter, are driven by gears which swing on a common centre and are always in mesh regardless of the thickness of stock being worked. With this arrangement thick boards can follow thin ones without running any risk of breaking the gears. The grooves in the rolls are cut spirally and tend to force the work down on the

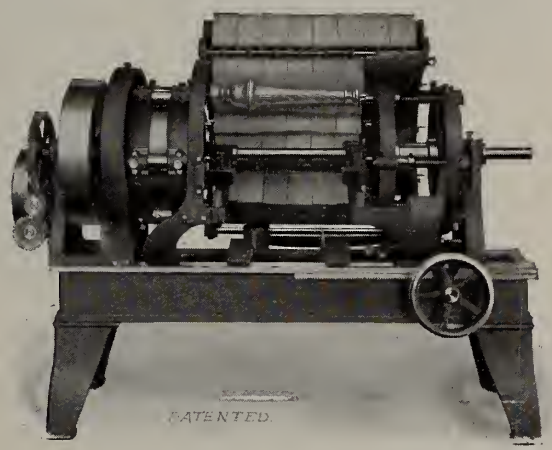


Hall & Brown box board matcher

cutter heads. The tables are 24 in. long and can be adjusted to suit depth of cut. When ordered the rear table is provided with glue pot and brass roller for spreading the glue. The glue pot is fitted for steam heating, but can be arranged for an electric heater. Shimer cutter heads are provided as regular equipment but special sleeves for using saws can be had. Full particulars may be had from the Hall & Brown Wood Working Machine Co., St. Louis, Mo.

Automatic Sander for Turnings

The accompanying illustration shows the Nash No. 10 Automatic Sander for sanding large turnings such as table legs, balusters, and similar articles. A similar machine is made for smaller work. With this machine the turnings, which are placed on supports on the front of the machine, are automatically picked up and centred and then carried into contact with four grades of sand paper, running from a coarse to fine, and afterwards released. Any pattern that can be produced on an automatic or back knife lathe or table leg or baluster machine, can be successfully sanded. All parts of the turnings are reached and all sharp members and shapes are preserved. When the turnings leave the machine they are as perfect in form as when turned out on the lathe. Turnings up to 2½ in. in diameter can be sanded at the rate of 5,000 pieces a day, while 3,000 larger turnings, up to 6 in. in diameter, can be turned out in the same time. A saving of paper, running as high as 50 per cent., may be made,

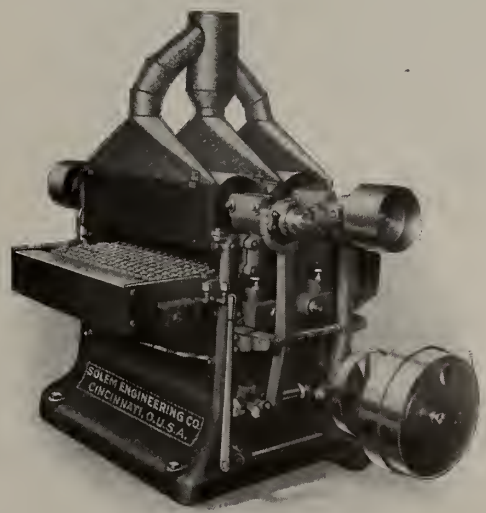


Nash sander for turnings

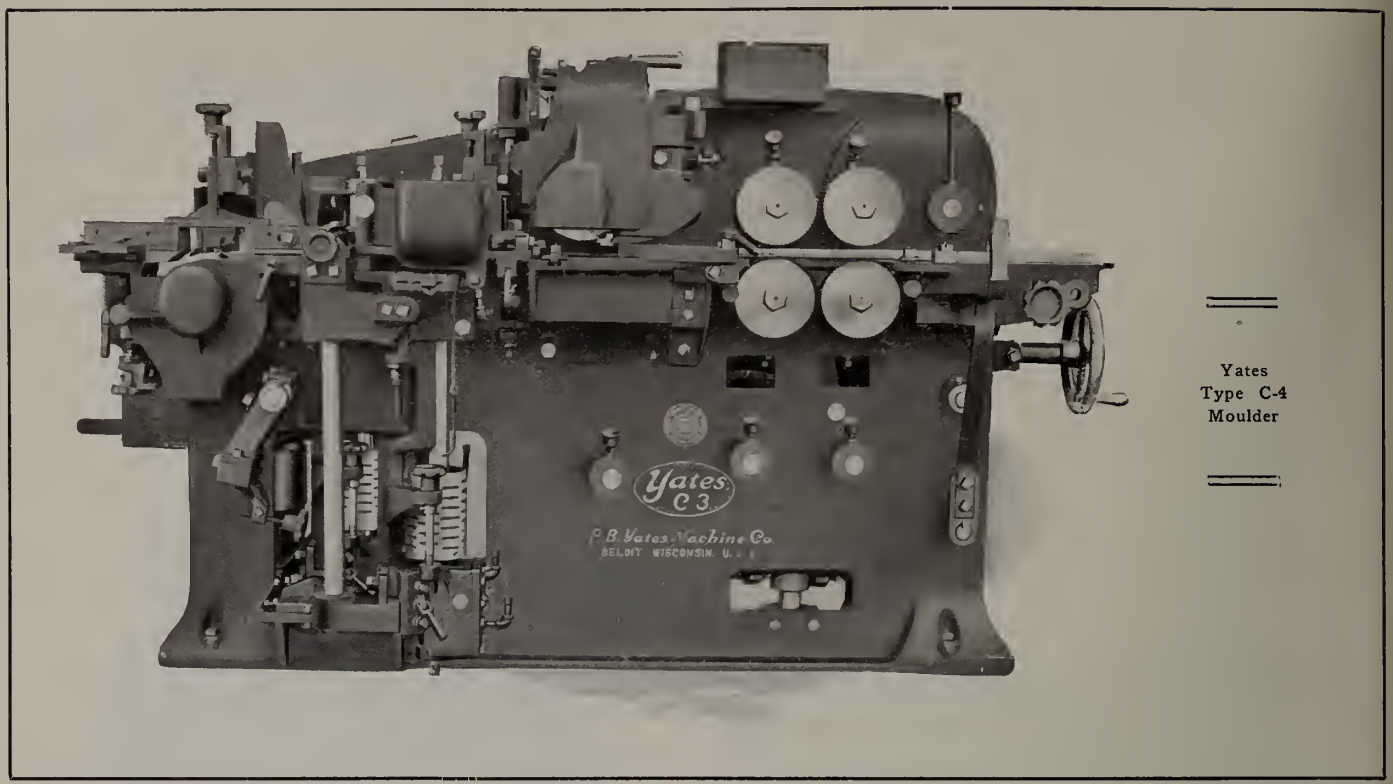
over hand handing, with this machine. J. M. Nash, Milwaukee, Wis., will be glad to furnish further particulars.

Oscillating Endless Bed Sander

Simplicity is the keynote of the design and construction of the Solem Endless Bed Sander. The frame is a heavy single piece casting having a large floor contact. The feed works consists of two steel chains on which are mounted selected steel slats and which are driven by four encased gears through cut sprockets. The ways, on which the bed runs, are removable and are lubricated by compression grease cups. The rubber cushions are of special design, be-



Solem endless bed sander



Yates Type C-4 Moulder

ing rectangular with a steel reinforcement built into them. This shape permits the sanding of the edges of short and narrow stock without special forms being employed, thus greatly increasing the capacity of the machine. Each drum is given a running balance at operating speed. Sectional spring take up fingers are provided to take up any slack in paper that may occur while machine is in operation. Steel grip roller fasteners grip both ends of paper and give initial take up. Each drum has independent adjustments from operating side of machine. The oscillators are driven from feed shaft by bevel gears. A single hood covering the entire machine is usually furnished but a sectional hood as shown in the accompanying illustration may be had if desired. Equipped for belt drive or may be had for direct drive from single 10 or 15 h.p. motor. The capacity of the 37 in. machine is 37 in. by 6 in. thick. Narrow stock may be fed to cover the entire surface of the bed. For further particulars write the Solem Machine Co., Rockford, Ill.

Special High Speed Moulder

The compact looking moulder shown in the accompanying is the Type C-4 Yates moulder. The machine was designed to meet the demand for a sticker that would run the smaller mouldings at fast speeds and still give the necessary smooth finish.

The machine is made entirely "open side" from end to end. All the principal adjustments can be made from the operating side of the machine. All bearings except the cutter head, are lubricated by grease cups on the outside of the machine in plain view, where they are not liable to be overlooked. Feed rolls or cutter heads can be removed without disturbing other parts of the machine. Every needful adjustment is provided, and the makers went to great length to make each adjustment so convenient that operators would not be disinclined to use them, thus all lock screws have handles to avoid the necessity of using a wrench to operate them. Four rates of speed are provided, 25, 50, 75 and 100 feet per minute, giving the operator a choice of feeds from slow to fast. A hopper feed can be attached, if desired, with all the attendant advantages. Special provision is made for jointing bits in the head.

Other features of this moulder are: One belt to drive top and bottom heads, one to drive side spindles, interchangeability of cutter heads, no gear in the feed works does double duty, chain drive feed works, reversible steel work bed and absolute rigidity of shoes opposite side heads. The base is cast in one piece and is flaring at the floor line, thus eliminating vibration which is so disastrous to the production of smooth work. The C-4 will handle stock up to 4 in. x 8 in., while a similar moulder, the C-3, has a capacity of 4 in. x 4 in. Full particulars may be had from the manufacturers, the P. B. Yates Machine Co., Hamilton, Ont.

Massillon Plant Being Enlarged

The Reynolds Manchine Co., Massillon, Ohio, manufacturers of automatic screw driving machinery, were recently granted permission by the Ohio State Commission to increase their capital from $200,000 to $500,000. $50,000 worth of new equipment has been purchased and it is anticipated that an additional quantity of machinery to the value of $50,000 to $100,000 will be installed during the present year. This large expansion is necessary to take care of their rapidly growing business and the ever increasing demand for Reynolds automatic magazine feed screw driving machines.

Motorizing the Factory Truck

If the signs read right, about the next step we are due for is a general motorizing of factory trucks, so that instead of a man pushing or pulling then along they will either move with their own motors or be pulled by a dinky motor. Already we find some of this in the wood-working industry, while in some others, with heavier material to move, the use of motors and motorized trucks is becoming quite general. Little electric dinkies pulling single trucks, or a train of trucks, are becoming a common sight.

Upholstering and Trimming

Upholstered Furniture Manufacturers Meet in Buffalo

The special meeting of the National Association of Upholstered Furniture Manufacturers, held in Buffalo yast month, was unique in many ways. This meeting was called at short notice, out of the season when conventions are usually held, for the special purpose of considering the acute labor situation which exists at many points.

Mr. Maltby, the secretary of the Association, in his report, outlined the activities of the organization for the previous three months. During this period the work of the office was largely centred on the Chicago strike, which has now entered the sixth month. The report made mention of a number of cases of bombing of factories and homes, and the slugging and intimidation of workmen. Some of the latter were seriously hurt by the strikers or their paid agents. The varied experience as to the co-operation with other cities was reported, but most of the larger manufacturing centres supported the Chicago manufacturers in their stand for the open shop, forty hour week and piecework.

Manufacturers from many different points tendered their reports, which showed a wide diversity of working conditions, notwithstanding the statement of the union leaders that the forty hour week was in effect in the majority of plants. On the final examination and checking up it was found that this was not true, except in a few rare instances in Eastern points.

Francis D. Campau, secretary of the Grand Rapids Furniture Manufacturers Association, gave an address, and dwelt largely on the interdependence of the manufacturers. Perhaps the outstanding address of the whole Association was that of S. D. Fennell of Buffalo, a former member of the Industrial Relationship Board for the district of Buffalo. In his address Mr. Fennell laid down some of the fundamental principles that should govern the relationship of the employer with the man in the shop, and also suggested practical methods of preserving the open shop and increasing production.

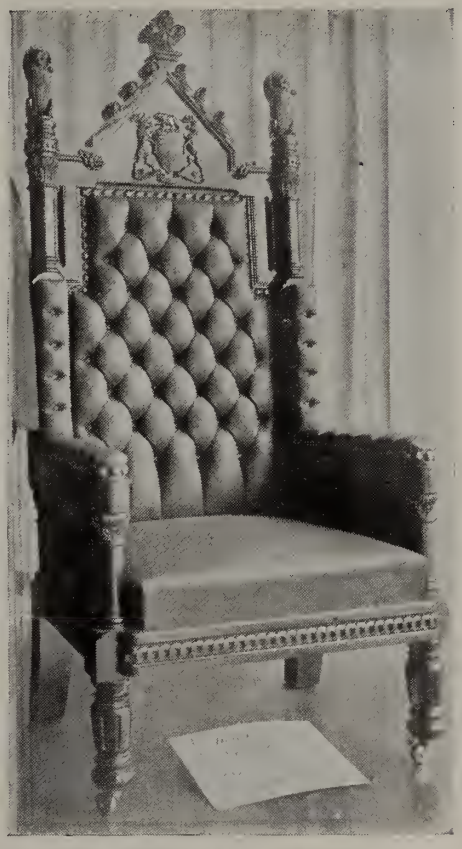
The National Industrial Relations Committee, the members of which came from widely separated sections of the country, held its regular meeting at which was reduced the support which was being given by the Association to the Chicago manufacturers. It was also decided to secure a director for this department.

C. S. Bather, traffic counsel of the American Furniture Manufacturers Association presented the railroad situation, dealing with the early return of the railroads to their owners. He suggested a number of very practical points and answered questions regarding the matter of packing requirements, labor relationship, and description of bills of lading.

Canada was represented by Mr. James E. Ferguson of the Furniture Manufacturers Association. In his address he outlined briefly the work of that Association which is very active and at the present time is largely engaged with cost and labor problems. Altogether it was one of the most helpul meetings held by this Association and those who took the time and trouble to attend were greatly benefited by the many helpful addresses and discussions which took place. The delegates present represented about fifteen different cities.

Mahogany Speaker's Chair

It appears to be the custom for each speaker of the Ontario Parliament to take the speaker's chair with him, probably to hand down to posterity, as he makes way for his successor. Thus each new government is called upon to provide a new chair for its speaker. The accompanying illustration shows the chair that was recently completed for the U. F. O. government by J. Mackle, 6 St. Albans street, Toronto.



Speaker's chair in mahogany

The chair is of heavy construction, standing about 6 feet high and is made of solid Cuban mahogany. Owing to the design the back is screwed onto the rear of the back post, the screw holes being counter bored and plugged. It is ornamentad with a considerable amount of fine carving. The front rail, side rails and

back posts being decorated with a scroll design. On the top of each post is a figure of a lion carrying a shield. The coat of arms of Ontario which make up the central figure in the back carrier the words "Ut Incipit Permanent Fidelis Sic" carved into the scroll underneath.

The upholstering is in genuine Morocco leather with hair filling. Large specially imported tacks are used in attaching the gimps. The finish is the usual mahogany finish.

Mr. Mackle has had a wide experience in producing special furniture of all kinds. Before engaging in business for himself some fourteen years ago he was a member of the firm of Chas. Rogers & Sons, Toronto, and was for thirteen years in charge of their upholstering department. This is the fifth speaker's chair of this design that Mr. Mackle has made for an Ontario government.

Reducing the Leather Shortage

A writer in "Raw Material" estimates the present annual production of leather substitutes at a $50,000-000 valuation. These leather substitutes in turn enter into manufactured products valued at over a billion dollars annually.

Leather substitutes are used most largely in the automobile, furniture and trunk and bag industries; to a smaller extent in the bookbinding, hat and shoe trades.

If ability to withstand constant flexing and bending is not a requisite of the material, leather substitutes compare very favorably with genuine leather. In appearance they suffer no disadvantage. As to utility, they have been proven very durable when used in the manufacture of articles for which they are adapted. They are impervious, cleanable and inherently sanitary.

The use of leather substitutes has greatly relieved the leather market. If they were not available, one would shudder to think of what the price of an ordinary pair of shoes might be in this year 1920,

Necessity is getting people away from the idea that a substitute is necessarily something much inferior, something to be avoided or derided. It is teaching intelligent people that a substitute may be a very useful and a very satisfactory article if used within the reasonable limits of its adaptability.

National Alliance Tackles Labor Problems

At a meeting of the National Alliance of Case Goods Associations, recently held in Atlantic City, various recommendations were made and a great deal of thought was given to the labor problems. Their committee on labor recommends, amongst other things, that they should overcome the shortage of labor by every means available. Some of these may be the installation of better machinery, better layout of equipment and routing of work through factory, the employment of female labor, less waste through excessive turn-over of labor, the training of young men to the needs of the industry.

Was further stated that the furniture industry must pay wages to skilled workmen that will be the equal of any other business requiring the same degree of skill, and that the furniture industry must not lose sight of the fact that the hours of labor are not stabilized and are not likely to be more per day or week.

Imitation Leather Gains in Popularity

From fad to famine was but a short step in the experience of dealers selling tapestry. For over a year tapestry has been in the greatest demand as an upholstery material. It is estimated that this demand is still at least twice the normal. On the other hand, the tapestry mills are running short-handed and not able to supply over 40 per cent. of the normal output.

Cheap, cotton tapestries are now selling at about three times their pre-war value and hard to get at that price. Fine woolen tapestries are practically off the market altogether. This condition has resulted in diverting a great deal of business from tapestry to leather substitutes. Possibly, like many other changes that have in the past been forced on mankind by circumstances, this may resolve itself into another blessing in disguise, for leather substitutes are more economical than tapestry and far more durable and sanitary. These goods are obtainable in good volume and are proving the salvation of the furniture manufacturer, the upholsterer and the dealer in upholstering fabrics.

New Upholstery Firm in Waterloo

A company recently organized to engage in the manufacture of a high class line of upholstered furniture, is the Engel Upholstered Furniture Co., of Waterloo, Ont. The line produced will be known as "Lion" brand and every effort is being made to make this trade name synonymous with quality and value. The furniture produced is confined chiefly to the luxurious chesterfields which are in such strong demand. They have already outgrown their present location and looking for larger premises. At present overtime is being resorted to in an effort to cope with the demand.

How to Retain Bark on Rustic Stock

For preventing the bark from flaking off logs used in rustic structures, the Forest Products Laboratory, Madison, Wis., recommends the following methods of seasoning and preparing the timbers as the most effectual:

(1) Cut timbers late in summer and score on two sides; that is, cut off narrow strips of bark for the entire length. Pile in shade in open pile to allow thorough circulation of air. Allow timbers to season until following spring or summer before using.

(2) Proceed as in (1), and in addition coat ends, stripped portions, and knots, with coal-tar creosote, using one coat a few days after timber is cut and another just before using the timbers.

(3) Proceed as in (1), but do not score bark When timbers are in place, tack bark on with large-headed nails, placing one to every square foot of surface. Paint heads of nails to resemble color of bark.

(4) Tack or nail the bark on without particular attention to time of cutting or other treatment.

The nailing method has been used successfully by one western company which maintains numerous rustic hotels, and also on a large rustic building erected for exhibition purposes.

It is a pleasure to be able to do something—to do it—and get praised for it.

The fellow who gets the snap is the one who puts snap into his work.

Origin of Vegetable Stains

Derived from Various Plants and Trees—Comparative Value of Vegetable and Aniline Stains

By Dixy Wells

Many stains are now being produced from vegetable sources, and finishers are recognizing this brand of material as being very satisfactory. In many cases even more desirable than those stains which are derived from coal tar products, but these vegetable stains are only a little faster in color than the anilines. Perhaps many of you are familiar with the list of vegetable stains, but as stated in a previous article, what we often need is reminding rather than education along certain lines, and the following may serve to refresh the memory.

The vegetable stains include Fustic, Logwood, Madder, Dragons Blood, Alkanet Root, Camwood, Brazil Wood, Bar Wood, Sapanwood, Sandalwood, Beachwood, Limawood and Red Sanders. Some of these materials are produced from roots of various plants, others come from tropical trees. As you will note by the various woods mentioned most of the vegetable stains are derived from that source. From the Woad Plant we get a dye which is almost identical with Indigo, having Indigotin for its essential constituent, and this vegetable product is in a great measure superseding the regular Indigo. It is produced from the fermented and powdered leaves of the Woad plant.

Quercitron Bark From Oak

Another well known vegetable dye is Tumeric, which by the way is largely used as a coloring for butter or any of the popular substitutes, but it is also used for staining woods. It is, of course, harmless to food. Another dye of the same color is produced from Quercitron bark and Persian berries. From the large oak trees in the eastern part of our country, the inner bark of which is yellow, we get Quercitron bark, and the Persian berries, which are imported from both Asia and Europe, when used with tin salts produce a coloring matter which gives a yellow lake. From trees in Central America we get Logwood, which is the heart wood of the tree. It is very hard, and the color produced from the substance drawn therefrom is a brownish red.

Some years ago Indigo was entirely derived from the Indigo plant, but now it is made artificially from Napthaline. The color, of course, was not found in the plant as such, but was produced by decomposition of Indican, which contains various substances besides Indigo, unless especially and properly purified. The best Gamboge comes from Cambodia in Siam, and is a resin of orange red shade, but it becomes bright yellow when powdered. From the Malayan rattan farms we get what is known as Dragons Blood, and from the fruit of this palm exudes the resin.

Various tropical American trees furnish us with many of our dyes. Brazil woods, for instance, yield coloring material such as Sapanwood, Beachwood, Limawood, Sandalwood, Camwood and Barwood, all of these yield red or purple dyes. From the pulp surrounding the seeds of a certain tropical American tree is prepared Annotta, a yellowish red color.

The facts given will tend to show in a general way the source of many of our vegetable stains. As transparency is an important feature of the finished stains the product of these vegetable sources are very satisfactory. These stains have been pressed into use during the war period and their merits should win them a more popular demand. Tests have proven that their colors are more permanent than aniline dye stains. The latter have the advantage of being clearer and richer in tone, and we believe they are also cheaper, a feature to which perhaps can be attributted their more universal use. The various staining substances reach us in a variety of forms, many coming in dry or powdered form. They are also received as solids or in liquids.

The average finisher can secure almost any description of stain, that is, any color or tone, but there are occasions when he must prepare his own, perhaps to match certain samples or to secure a certain exclusive color effect. There is no doubt about the saving secured by producing one's own stains, particularly in small quantities, but one, of course, must thoroughly understand this game if the best results are to be produced.

Advisable to Practice Matching

The operator must know how to manipulate certain materials in order to produce the correct color, and the desired quality of finish. This is of just as much importance as a proper knowledge of application and handling of the finishing materials.

It is very good practice to experiment with stains as it gives the finisher an intimate knowledge of his "tools," particularly, where he has a room suitable for such work. Plenty of light and air are important. The matching of stained woods also increases one's skill.

With aniline stain, in particular, there is practically no limit to color possibilities, and with both the vegetable and aniline stains a very wide margin is afforded for original work, not in the matter of producing "freak" colors or combinations, but in the accurate matching of samples and producing conservative rich and permanent effects, which show skill and contribute to sales.

Thick or Thin Filler?

A good finisher knows that to secure the best results he should vary the consistency of the various fillers for different woods. The more open grained the wood the heavier the filler should be. Oak is a very open-grained species, more so than either walnut or mahogany, therefore it follows that a heavier filler should be applied when finishing oak. This idea should be followed consistently on all kinds of wood.

Overcoming Pitted or Rough Finish

Operators of Spray Machines Often at Fault—Temperature of Room, Stock and Materials Must Not Be Overlooked—Filler and Foundation Sometimes to Blame

Many manufacturers and finishing-room foremen often run up against pitted or rough surfaces on their varnished product and are sometimes at a loss to account for and overcome this trouble. A number of causes might be cited and perhaps not the least of them is temperature. Temperatiure plays a very important part in finishing room results. When speaking of temperature reference is made to the temperature of the finishing room, temperature of the article to be finished and temperature of the varnish that is being applied.

Any two of the above items taken at the correct temperature, together with the third at a temperature much lower than the other two will cause a rough or pitted finish. If the finishing room is kept at 70 deg. F., see that you varnish and your work are at nearly the same temperature. Varying temperature during the setting process will also cause pitting.

Again, a good many spray operators, due to insufficient experience or perhaps to neglect, use too much air to break up the varnish or maybe not enough. No specific pressure can be recommended for different varnishes require different pressures. This must be left entirely to the discretion and good judgment of the operator. A little experimenting, if pitting is due to this reason, will remedy this.

Do not mix varnishes, mixing varnishes of different grades will lead to serious trouble. One can readily see the difficulty resulting from mixing varnishes of different flowing and drying qualities. Each grade should be applied separately. Varnishing over a "sweaty" or still moist surface, will give a pitted result. Should there be moisture, damping down the surface with a chamois skin is recommended.

The filler coat should not be overlooked as it may be the source of trouble. Careful application of the correct filler for the particular wood with proper drying and rubbing will sometimes eliminate trouble from this source. The term "pitting" is quite commonly used for "pinholing." This defect is due to a variety of causes, but the varnisher is never responsible for it. The foundation for the trouble is invariably laid before the varnish coats are applied. The filler may be too thin for the wood on which it is used.

The pores in the wood are not being filled. In the sanding of wood, the pores are completely filled with a fine dust. These must be freed from dust, so as to enable the filler to get to the bottom. Then use a good grade of filler, one that will not dry too fast, or it will get brittle and dust, nor too slow, as it is liable to remain fatty at the bottom of the pore and give you trouble afterwards. Lay the filler on thin and rub the pores full. Should the filler not be dry to the bottom of the pore, the method of cleaning off filler, will many times disturb the filler in the pores, so that as much will be worked out as was worked in.

Too much oil in filler is another prolific cause of pinholes. Too much oil causes a sticky filler which, in the rubbing process, is pulled out of the pores. A wood filler carrying too much oil may also dry in a film over the surface leaving the pore packed with a moist filler, which in the process of evaporation will cause a slight eruption, these eruptions resulting in pinholes.

Pinholes are often caused in oak, direct heat dried, by a cheap golden oak stain made from a grade of Asphaltum carrying too much coal-tar. A stain of this kind will combine with the filler and retard its drying to the extent of causing the generating of gases in the pores. There is only one remedy for this, a better stain.

Do not blame veneer for pinholes. Pinholes are not in the veneer, but in the pores of the veneer. Pinholes are found more frequent in mahogany than in any other wood, the cause in many cases, can be traced to using a drum sanding machine. This packs the pores full of a very fine wood powder which in turn holds the moisture of the water stain and when sealed over with filler and varnish, causes a gas to generate in the pores, which must escape—hence a series of eruptions which leave very small holes like a pin puncture. To overcome this, brush the work thoroughly with a furniture rubbing brush, which will dig the dust out of the pores, then dust with air pressure and let the water stain dry from 12 to 18 hours before filling.

Many cases of pinholes can be laid to the glue used. In the glue that has been drawn up in the pores by too much heat, are your pinholes. They are in the glue in the pores, not in the veneer. In examining a piece of glue that has run over the edge, you will find that it does not dry solid, but is full of pinholes. Should this be drawn up in the pores so far, that enough filler could not be applied to completely cover these holes, and should the filler not stay there during the rubbing process, you will find pinholes.

Some pinholes are due to a poor grade of glue which will soften sufficiently under a water stain to hold moisture. They can result only where the original hole is too deep for the varnish to reach the bottom and fill up. It is more difficult to work varnish to the bottom of the pore, than it is to work filler, owing to the elastic nature of the former.

In summary, all that can be said is that the preparatory and filling stages are the source of trouble. Be certain the pores in the wood are free from dust, the glue of good grade, the filler of correct plasticity properly applied and propertly handled after the application.

Finishing Silver Gray Oak

This is a very nice effect, looking like oxidised silver. Make the surface perfectly smooth, then stain it with a preparation of silver nitrate, one part, in 50 parts of water, both by weight. Apply two coats of this, then a coat of commercial hydrochloric acid; let this dry, then apply a coat of ammonia water of ordinary strength. If the work can be left to dry in the dark it will be better. The finish may be in oil or varnish.

The Drying of Varnish in Quick Time

Dry Kiln Assists Varnish to Flow Out Smoothly—Humidity Controlled Temperature Dries Coat from Bottom—Positive Circulation of Air

By Bert D. Wolf

In most finishing departments at the present time, the question of rapidly drying the varnish coatings is a very important one, and invariably leads to the discussion of conditioning the entire finishing room or of building separate varnish dry rooms.

In my humble way, I am going to try to convince you that while conditioning the entire room is a step in the right direction, that it does not meet all the requirements as successfully as building separate varnish dry rooms.

Heat Gives Better Results

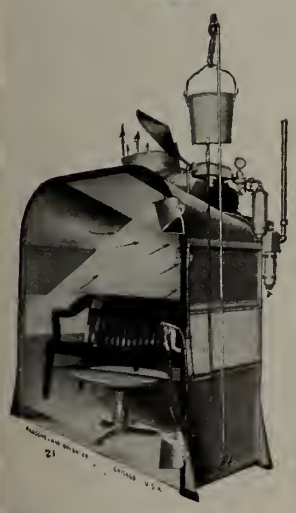
Practically all finishing departments are using air brushes in applying the varnish and in so doing both the air and the varnish used are being heated in one way or another, and the work should immediately after being sprayed be put where the temperature is warm enough to flow the varnish out smoothly, otherwise the varnish having been forced on to the surface with a pressure of about ninety pounds of air, will remain pitted and will take a much greater amount of labor and time to sandpaper between coats or to rub the final coat than when it has flowed out to a smooth surface.

It has been my experience in this connection that varnish applied in this manner will not flow out smoothly unless the temperature in which the work is placed is between ninety and one hundred degrees fahrenheit. This being a fact, how many of your finishers can you get to work in a conditioned room heated to at least ninety degrees during working hours, and if they did remain, how much work would they actually do each day in this temperature.

Operations Should Be Separated

Is it possible to produce clean varnished surfaces in a finishing room that is entirely conditioned when you are filling and sandpapering in the same room, both of which operations cause considerable dust and the circulation of the air continually driving this dust from place to place, when it takes varnish from twenty minutes to one hour to set dust free? Have you ever noticed how the dust in a finishing room travels toward spraying machines and is this not a natural thing to happen, because you are employing a forced draft at each varnish booth to take the fumes of the spray away from the work being done and away from the operator who is doing the work? How much more steam will it require to heat the entire room than to heat the separate dry rooms? Do you want to heat the work continually that you intend to sandpaper or rub? Varnished surfaces when warm are natur-

PAASCHE



Most efficient and economical air finishing system known. One of our many popular (completely equipped) air finishing outfits as used by furniture plants everywhere. Made in various sizes to meet all requirements. Successfully applies liquid materials—all kinds and descriptions.

ally softer than when cool and very easy to scratch or mar. Will you get as positive a change and the same circulation of air in all parts of the finishing room as you can get in the separate dry rooms at so small a cost?

Should one decide to provide separate varnish dry rooms the first necessary step is to select the location for them and this should lead you toward the centre of the building where invariably the light is not strong enough to have work properly done, allowing the space next to the windows all around the room to be used as working space and on one side of the room do all of the dust raising work such as filling, sandpapering, dusting and rubbing and on the other side arrange the spraying booths convenient to the doors of the varnish dry rooms and place any brush or patchers on the same side if there is enough room. If not put them at one end of the room. By this arrangement you will have your dry rooms practically separating the dusty operations from all of the coating and your work will be delightfully clean. The spraying booths being near the doors will allow the varnished work to be put quickly into the dry rooms.

Temperature of From 90 Deg. to 100 Deg.

Varnish dry rooms should be kept at a temperature of between ninety to one hundred degrees fahrenheit during working hours, to allow the varnish to flow out smoothly, keeping the doors closed as much as possible to avoid any dust getting into them and settling on the fresh varnish. After working hours the temperature should reach about one hundred and ten degrees and remain very close to this from five to seven hours when the steam may be turned off and the temperature allowed to come down gradually. From two to three hours after turning off the steam have the doors opened and upon arrival for work in the morning the varnished work so treated will be ready for the next operation provided you have the proper dry rooms and they are in good working order.

Mild Circulation Required

I have frequently heard the statement made that the air in certain dry rooms is changed so many times in five or ten minutes and I would caution any one about creating a cyclone effect—surely no finishing foreman would think of putting freshly varnished goods into a forty-mile-an-hour wind to dry, as this would cause the varnish to dry from the top down instead of drying from the bottom up, and you would have a wrinkled or checked surface when the varnish did really dry at the bottom. Truly varnish requires oxygen from the air to dry it, also a certain amount of moisture to keep the surface pores open and allow the oxygen to penetrate to the bottom of the coat and one should see that both are supplied in sufficient quanity to get the desired result.

The more simply a dry room can be constructed the more positive will be the drying and the less expensive it will be to operate it. The less machinery you can use, the easier it will be to keep the room in good working order. In fact the circulating system of a properly constructed dry room should act on the same principle as the lungs, in that it takes in all the fresh air needed for use in drying varnish and then expels it without creating any dust raising winds or skin drying drafts. This naturally requires intakes so arranged that you will get an equal distribution in all parts and sufficient outlets regularly distributed to allow the used air to be expelled.—"American Furniture Manufacturer."

Choosing a White Enamel

For general work the most necessary good qualities to seek for in a white enamel are good color, fair body, absence of undue stickiness, free flow after spreading with rapid subsequent setting, steady drying and hardening without loss of lustre.

The color should be free from green or pinkishness, and if there be any departure from a clean white, it should only be in the direction of a slightly yellow tint. The body should be such that three coats will show a solid white when used over black.

The viscidity should not be so great that a stream of the enamel will continue to flow in an attenuated and unbroken thread, like treacle nor so little that it can be made to drip in regualr drops. It should be easy to spread it evenly without undue drag on the brush.

The flow must be free enough to eliminate every trace of brushmarks caused in spreading, and may be tested by laying off some of the enamel, with criss-cross irregularity on a pane of plate glass, in which case it should find a perfectly level surface in three minutes or so, by which time it should be so set as not to run down the glass if it be placed on edge.

With regard to drying, it should be dry enough to admit of safely passing a clean, well-wetted leather over it without damage in eight hours, and to lose all tackiness in from 24 to 30 hours.

The Successful Application of Shellac

Shellac should not be applied in a damp, cool atmosphere. It has been clearly demonstrated time and time again that successful results cannot be secured if the humidity is high. If applied in a damp place it is likely to show white streaks and spots, especially where it has been lapped in brushing. These spots will usually disappear as the shellac dries but in many instances a clouded appearance remains. To overcome this high humidity in a finishing room it is necessary to raise the temperature as the higher the temperature the lower the relative humidity, provided the amount of moisture contained in the air is the same. The proper point can be determined by the way the shellac lays. This material should be applied quickly, evenly and with little brushing.

Fine clean cutting sandpaper should be used for sanding shellac. If it clogs in usually follows that the coat is not dry or the shellac has been adulterated. An excellent pad or block may be made from a piece of heavy felt.

Should an edge be sanded through it must be restrained and touched up with shellac before the varnish is appied. The reason for shellacing is that if the stain happened to be lapped on the shellac it would show green under the varnish, unless it was covered with shellac.

A Green Finish for Oak

A very pleasing green finish may be secured on oak by mixing together one pound of chrome green and one-half pound chrome yellow, both of medium shade. In another vessel mix together three pints of turpentine, one pint of raw linseed oil, and a little good white japan. Thin the color mixture with this and apply one coat. When dry apply a coat of white shellac, colored just a little with tumeric and a few chrystals of green aviline. Finish with wax.

MARIETTA WOOD FINISH SPECIALISTS

Beat the High Cost of Shellac

The ever increasing cost of shellac has become a serious problem among manufacturers of furniture.

But hundreds of them are now holding down this cost by using

BUCKEYE SHELLAC

Composed of 50% pure shellac combined with another specially selected hard gum, it is **guaranteed to contain no rosin** and for all practical purposes is serving the place of shellac at a **saving to the user of approximately $1.00 per gallon.**

BUCKEYE ORANGE SHELLAC IS lighter than the pure orange shellac and for that reason is used by some in preference to the White Shellac, adding still more to the economy.

Buckeye Shellac has long since passed the experimental stage. We have sold hundreds of barrels to leading manufacturers during the past year.

Like all MARIETTA PRODUCTS, it is thoroughly practical—a fact which you can prove. Let us send you a sample for testing or give us a trial order.

Tear out and return to us the attached coupon and we will do the rest.

"Good workmen know the difference"

Look for this trade mark on the back of every sheet, belt or disc.

A $25.00 prize—and Joe Pocaro earned it.

"A prize of $25.00 will be given to any employee who can show a means of speeding up the work of his department.

JOHN LANG, *Superintendent.*"

Joe Pocaro, on his way to lunch one noon hour, stopped at the factory bulletin board and read this notice. Joe runs a belt-sander in the Estey Piano Company's big factory in New York City. Under the whirring sandpaper belt of his machine the hardwood panels of the piano cases receive their smooth satiny finish.

That afternoon Joe did some tall thinking as he worked. Most of the time lost in the finishing department was due to belt trouble, he decided. Breaking belt joints, even when the men made their own—grits wearing off in an hour, that should have lasted half a day—and all the other troubles that require a change of belts and eat up time.

Next day he spoke to Mr. Lang, the superintendent, "You've got a lot of sample sanding belts in your office, Mr. Lang," he said. "Will you let me have them to try out on my machine?"

Mr. Lang tells the rest of the story:

"I let Joe have all the sample belts that had accumulated in my office. In a few days he came back, with one of them in his hand. 'Mr. Lang,' he said, with a grin, 'put this belt on all the belt-sanders and I'll win your $25.00.'

"That belt was marked Manning Speed-grits," Mr. Lang continued. "I took Joe's advice and put them on all the belt-sanders. Result—I'm saving hours of time in my finishing department, and Joe Pocaro got his $25.00."

"It pays to talk over your troubles with your workmen," he concluded. *Good workmen know the difference.*"

Send for "The Difference Book." Address the Ritchey Supply Company, 130 West Wellington Street, Toronto, Canada, or write to the Manning Abrasive Company, Troy, N.Y.

Manning Speed-grits

Don't say Sandpaper— say Speed-grits.

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.

Increasing speed and reducing costs while making certain highest quality work, in your finishing room with

Aeron Finishing System
Surpasses Brushing

Spray-finishing Equipment

Whether you manufacture phonograph cabinets or chairs, metal filing cabinets or brass beds; whether you varnish, enamel or lacquer those products, 1 Aeron operator will do at least 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be uniform and free from brush marks, runs, fatty edges and like faults.

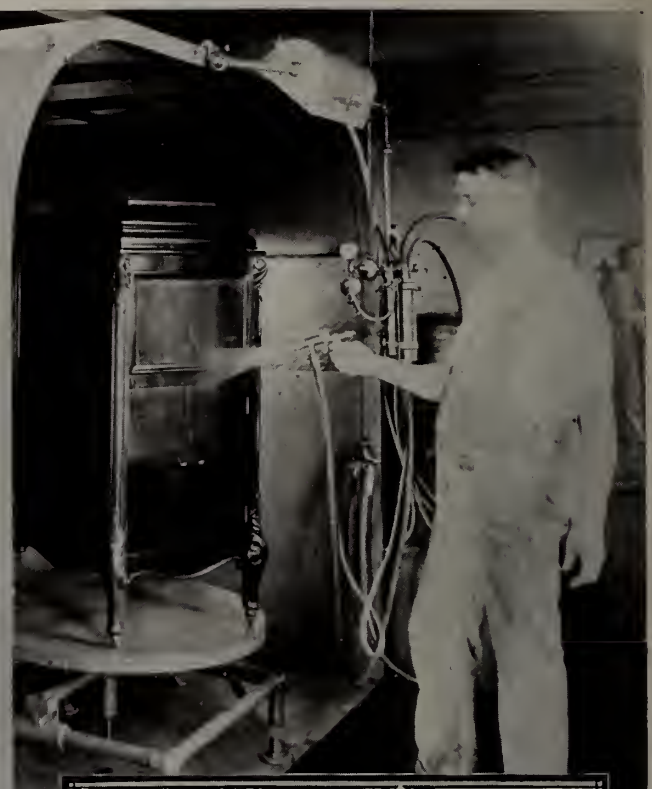
Aeron System exhausting equipment will insure a clean, healthful place in which to work; and reduce any fire hazard.

The outfit will be on the job every day, and cost very little to operate and keep up.

These average savings and advantages possible in your finishing room, are taken from the years of economical, and successful operation of the Aeron System in thousands of wood and metal-working plants of every kind.

Let us mail you further particulars that meet your individual requirements—

The DeVilbiss Mfg. Co.
1318 Dorr St. Toledo, Ohio, U.S.A.



Manufacturers also of

Buying and Handling Veneers

Suggestions for Judging Value of a Log—Size of Sheets Most Important—Wide Stock Eliminates Excessive Jointing

By A. M. Clark

A good veneer man should be able to size up the value of a log of veneers, in fact that is one of his first and most important duties. When examining samples, even though three are shown one from top, bottom and centre, study the samples and keep a sharp lookout for defects, for it is practically certain that a log will not be any better than the samples exhibited. If wormholes, knots, sap or other defects are noticed try to form an opinion as to how much of the log will be effected and the amount of percentage of waste that will result. All these defects cause a certain amount of waste and in some instances entail extra labor so if a good price is being paid the loss or waste will assume large porportions as the cost of the good material in the log will be increased to a considerable extent.

Another important feature that calls for a certain amount of judgment is the length and width of the stock to be purchased. Needless to say it is advisable to always try and buy a log that will cut to the best advantage. When buying veneers a person usually knows where that particular veneer will be used or in other words veneers are usually bought for a specific purpose. Stock that will work up well on one article if used on some other item may show a large percentage of waste. For instance, if one is buying walnut butts for piano work and the cases is say, four feet, six inches long, the veneers when cut for a butt joint will be two feet, three inches long. One should try and secure stock that will cut with as little waste as possible so if a butt thirty or thirty-two inches long can be secured it will give a sufficient length to get out any part of the case. The nearer one can come to the required sizes the greater value there is in the log secured.

Wide Stock Works Advantageously

The same principle should be followed where buying oak or mahogany or other long stock. However, with the long stock there is this difference, that the material works out to better advantage as four or five lengths may be cut from the one piece thus doing away with a considerable amount of trimming waste. Another point in buying long lengths is to pick the widest stock availabue for the wider the veneer the fewer joints will be needed and thus the work lessened and the waste reduced.

When commencing to cut a log it is a big advantage if one knows how to go about it; where to start and how to secure the best effect from the figure of the veneer. It is advisable to start with the widest part of the case or article to be veneered and cut the veneer for all the widest parts first. In many instances this will avoid the necessity of making any joints. Then by gradually working down to the narrower faces it will be found that practically all the narrow pieces can be utilized to advantage with as little labor and waste as the wider pieces. It would be well to mark each piece of veneer as cut so as to be sure to get the right pieces together and thus secure the best effect and show the figured grain to advantage.

Veneers Must Be Dry

Before jointing it is important to see that the stock is dry. This is an item that must not be neglected. If it should be glued up when it is not thoroughly dry it will surely dry out after it is laid and as it dries it is bound to shrink. As the veneer shrinks it is bound to give somewhere and it is likely that the joints will part slightly and checks appear. Nothing is more unsightly than an open joint in the face veneers, no matter how slight the movement may have been. In view of this one should be sure that none but dry stock is laid up.

When the writer first started at the veneer work we used to make all our joints with a straight edge and knife, cutting the joint by hand. To-day we find that most places have large cutters, similar to paper cutters, or veneer jointing machines. We have a cutter and make all our joints with it. Better results are secured if the stock to be jointed is perfectly flat. Not only does a better joint result but a considerable amount of time can be saved as more sheets may be handled at a time.

When cutting the joints by hand it was only possible to joint one sheet at a time but using the cutter we find that we can handle as high as forty-eight and fifty sheets at one operation. With this machine the knife must be kept sharp and in first class shape. Should it become sprung in any manner poor joints will result. Veneer jointing machines work out very advantageously and enable a large quantity of perfectly jointed veneer to be put through in a day's run.

Gluing Paper and Fabric on Joints

When taping the various joints the first thing is to see that the figure matches. We follow the practice of tacking the veneers on a board, making certain that the joint comes up perfectly tight. Next thing is to glue a strip of paper over the joint. This is allowed to stand while three or four sheets are being jointed and then taken off the board, reversed and a piece of veneer fabric glued over the other side of the joint. This fabric is left on when the veneers are glued on the core and helps keep the joint from opening. I have tried veneering without the fabric on the underside but find that the results are better when it is used. When making a joint in mahogany, oak or any veneer where the joint runs lengthwise of the grain the same procedure is followed only that the fabric is not required on the underside, because if the veneer is thoroughly dry there is not as much danger of the stock shrinking and the joint pulling apart for there is not as much endwood as in a butt joint.

Many shops are employing veneer taping machines and find that these machines make a well taped joint.

bringing the two sheets well together, and increase the output of the department. The machine is certainly a labor saver. The reason we have not installed one is as explained elsewhere in the article, namely that our policy is to buy stock that will need a minimum of jointing.

A New Company in Walnut Field

Well Equipped Plant Operating on Walnut Exclusively—Outline of Operations Performed in Producing Various Veneers—Good Supply of Raw Material Available

One of the newer companies who are at present devoting their attention to the manufacture of walnut veneers is the Pickrel Veneer Company, New Albany, Indiana. This firm, which was recently incorporated, has taken over the plant and business of the John N. Roberts Co., New Albany, and are carrying on at the old stand.

A glance at the personnel of the new organization

Veneer saw in Pickrel plant

would indicate that those in charge are well versed in the veneer manufacturing game. The president, Ray E. Pickrel, who is also president of the Pickrel Walnut Co., St. Louis. Mo., has had twenty years experience in manufacturing and selling hardwood and veneers. B. M. Minigus, secretary and manager, and N. C. Lyon, the plant superintendent, are also men of wide veneer manufacturing experience.

The plant, which has direct rail connections with several lines, is completely equipped with modern veneer cutting machinery. The equipment installed includes an eight foot band mill, for cutting flitches and lumber, veneer saws, one twlve foot Capital slicer, two combination rotary and half round machines, and in addition such equipment as edgers, swing cut-off saws, clippers, etc.

Large vats used for steaming logs

The log buyers of this firm scour the woods and purchase the very choicest walnut logs. These are delivered to the mill either by rail or by auto truck. Upon arriving they are taken to the band mill and cut into suitable flitches. The next operation is steaming. The accompanying illustration shows the vats used for this purpose. The steaming is carried on from twelve to twenty four hours, depending almost entirely on the character of the log being steamed.

The wood is now ready to be cut into veneers. The flitches for the rotary stock are taken to the rotary or half round lathes while the other material goes to the slicer or veneer saw as specified. After being cut the

The machine used for cutting sliced veneers

veneers are trimmed or clipped and dried in a modern veneer dryer. This machine is capable of handling fifty thousand feet of veneer each day and produces a flat, thoroughly dry product.

The sheets are graded and sampled and then placed in a large warehouse where they are kept until sold. This building provides accommodation for fifty million feet of veneer and contains in addition to the storage facilities a veneer taping department and a crating and shipping room. Each log of veneers is properly tagged with the log number and the number of feet and samples taken which are shown to a buyer so that he may see what he is purchasing. As a log is sold it is promptly crated and shipped out to the customer.

The plant is admirably situated and commands an almost unlimited supply of walnut logs. The veneer manufactured consists of a complete line of walnut in sliced, sawn, rotary cut, half round and fancy butt stock.

FIFTY-TWO YEARS IN OPERATION, BUT -

ahead of the times in equipment. Business institutions of many years standing divide themselves naturally into two classes. One group through too long moving in the same groove eventually dies of dry rot, in many cases behind the times in methods and equipment. The other absorbs and applies knowledge with each year of

Northern Grown Oak

experience and so keeps constantly many paces ahead of the procession. The evidence of our participation in the second group is concretely shown in our plant and reputation.

American Beauty Walnut

Those founding the business originated and operated the first band sawmill used in the United States. Today we are in many things that make for quality and efficiency just as far ahead relatively as that mill was in the days gone by. In short, the experience acquired through fifty-two years of operation has not been left to accumulate dust in the office files. It has been applied by the successive managements, who, all in the same family, have been anxious to maintain, each for his generation, an equal standing with the generation which preceded him. Today the HB brand is recognized nationally as the stamp of quality in the goods and in all the services going into each delivery of the goods to your plant.

Buyers of Veneers and Panels

will find it to their advantage to purchase from the manufacturers and dealers whose advertisements appear in this publication. They are progressive firms—the leaders in the business, which is a guarantee of good service and prompt attention to orders.

Give your business to the man who will spend his time and money to get in touch with you. He deserves it—if his stock and prices are right.

Laying Ten Ply Grand Piano Rims

All Plies Glued in One Operation—Speed Main Requisite When Glueing Commenced—No Trouble from Warping or Checking—Rims Stand for Months

An interesting veneering operation which is performed in a number of piano factories is the laying up of the bent rims for grand piano cases. These rims are no doubt made to different specifications by different manufacturers and vary in length, running from fourteen to twenty-two feet, according to the style of piano being made. The writer recently had the pleasure of watching this operation being performed. This particular piano maker builds up an eight ply core for the outer rim and lays a face veneer on each side. An inside rim or blocking is made, of twelve or fourteen ply, to fit the outside rim.

The accompanying sketch shows the type of form and clamps used. These are built up of 1½ pine and accurately shaped. The form for the outside rim has the inside section solid and the outside half divided into a number of pieces. The reverse holds true for form used for the blocking. Here the outside is solid and the inner section divided. This ensures that the two rims fit accurately, as the inside of one and the outside of the other are laid against solid forms. These forms are well shellaced to prevent the glue adhering.

Preparing the Core Stock

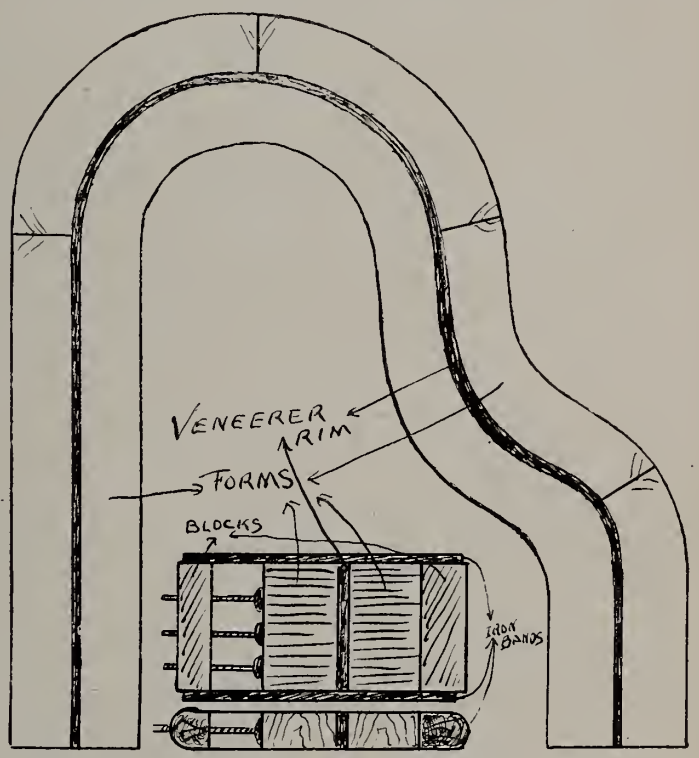
The core stock is first prepared. This consists of ⅛ in. sawn whitewood and ash veneer. As far as possible these woods are laid alternatetly in building up the core. In preparing the veneer for this work all the cracks and checks, if not too large, are carefully taped. Any knots that may occur are cut out and veneer fitted and taped in all holes. The core stock is, as far as possible, purchased in long lengths, but often for the larger cases and where it was found necessary to cut split ends, etc., a square butt joint is made and taped. In laying, these jointts are alternated and kept as far apart as possible. The same applies to a flitch with a knot running through it. Every second piece is turned end for end and the knot cut out and plugged. This ensures that two such places will not come opposite each other. The outside sheets both inner and outer, which must be in one length, are sanded on both sides on a drum sander. This gives a smooth surface for the face veneers. As crossbanding is seldom used this latter operation is very necessary.

As intimated crossbanding is seldom used. The grain of the core all runs lengthwise and when mahogany and plain walnut veneers are laid the grain runs in the same direction as the core. Some times when a fancy burl or blister walnut or other fancy wood is laid where the grain runs at right angles to that of the core a crossbanding of face veneer, not fancy, is laid diagonally between the core and the face.

Matching and jointing fancy veneer for a case is an operation requiring considerable patience and skill. In preparing burl walnut for a grand rim there are, say, twenty pieces fourteen inches long and twelve wide to be jointed side by side. Not only does the grain have to match but unless every piece is absolutely parallel it will be found that when taped together the completed sheet will have a nice curve to it, one end being thrown out perhaps six or eight inches. If this happens the joints will all have to be corrected to straighten the curve.

Material Warmed In Heater

When everything has been prepared the core stock is laid, in order, in a long heater and left there for about three hours. Two thin zinc cauls are also warmed in this heater. While the stock is warming a long bench is set in place, the forms placed and everything made in readiness. All the pieces are laid in one operation and when once the gluing is commenced



Forms and type of clamps used

speed is the main requisite. The glue is all spread by hand and large pots are placed convenient to the long bench.

The first piece of core is removed from the warming box and as it is an outside piece is glued on one side only. The remaining pieces are brought out one by one and glued on both sides and carefully laid in place. When the last piece has been glued on both sides the inside face veneer is laid and a hot zinc caul placed on top and the whole bunch turned over. Glue is spread on outside of the first piece brought out and the outside face veneer laid, then the remaining hot caul.

The rim is now picked up and placed on the form. The outside sections are shoved in place and the clamps put on.

Pressure Worked Around Rim

The pressure is first put on at the outside end of the straight side and carried right around. Then all the clamps are loosened and commencing from the

same end each one is tightened in turn. This ensures that any bulges or kinks are worked out. The same procedure is followed when laying the blocking except that there is not any face veneer to apply. The rims are left in the forms for about three days. When they are removed a number of batons are screwed on the inside to prevent any warping and a baton fastened across the end to prevent spreading. One edge is now cleaned with a draw knife and trued up on a jointer, then it is ripped to width on a saw.

The finished rim is now stored for from two to six months so as to dry out and set before being utilized. With the grain all running in one direction everything shrinks together and practically no trouble is experienced from warping or checking.

When to Heat Wood Before Glueing

Whether a hide glue joint will be strengthened or weakened by heating the wood before gluing depends on the size of the joint. It is assumed, of course, that the work is being done in a glue room that is warm and not draughty, and that the wood itself is at room temperature. Under these conditions, if the joint to be made is of small area, heating the wood is unnecessary. In fact, it may be detrimental, for the warmth of the wood will keep the glue thin; and, when pressure is applied, too much glue may squeeze out, leaving a starved joint. It is very easy to apply too much pressure to a small area.

In making glue joints of large size (several inches each way), heating the wood before gluing is of distinct advantage. Many experiments at the Forest Products Laboratory, Madison, Wis., have proved that when the wood in large joint work is not heated, the joints develop full strength only in spots. Weak spots and even open joints are too frequently discovered.

Uniform high strength in joints of large size may be secured by heating the wood in a hot-box for 10 or 15 minutes at 120 to 130 degrees Fahrenheit just before gluing. The heat from the wood prevents the glue from chilling and keeps it liquid until pressure is applied.

It should be remembered that heating the wood retards the setting of the glue to some extent. In heavy woods, from which the heat escapes slowly, this retarding effect is more marked than in lighter woods. In all species glued cold at the laboratory the time under pressure required to develop full joint strength was less than 8 hours. When heated wood was used, at least 10 hours were required to develop full joint strength in mahogany, and more than 12 hours in red oak and maple.

The Length of Wood Fibres

The current supposition that each species of wood has a characteristic fibre length is not borne out by the many thousand measurements which have been made at the Forest Products Laboratory on wood fibres. These measurements show that a greater differences may be found in one tree than exists between the average fibre lengths of different species.

In one Douglas fir disc, for example, the fibres varied from .8 to 7.65 millimeters (.03 to .3 inches) in length, which is a variation of nearly 7 millimeters. On the other hand, the averages of several thousand measurements on Douglas fir and longleaf pine were less than one millimeter apart, being 4.41 and 3.67 millimeters, respectively.

In the first case, 67 per cent. of the fibre measurements in one tree fell between 4.5 and 6.5 millimeters, which roughly indicates the meaning of the common term "average fibre length" for the tree or species.

Such data obviously can be of little value for identification purposes, because of the overlapping of the ranges of fibre length in the various species.

Some relations have been observed between the length of fibres and their position in the tree. During the first 20-50 years of growth, the increase in fibre length from the centre of a tree outward in any plane is very striking. An approximate maximum having been attained, fibre length, though it may fluctuate somewhat, does not radically change thereafter, even in trees 400 or more years old. Some increase in fibre length occurs also for about two-thirds of the distance from the butt to the top. Within each annual ring the length of the fibres varies, particularly in the conifers, where the early springwood has the longest elements, and the last-formed cells of summerwood the shortest in the ring.

No clearly defined relation has been found between fibre length and the strength of wood. The longer fibres are often found in the weaker material.

Resistance to Decay Now a Factor in Choice of Airplane Wood

Airplanes in the past have been so short-lived that it has mattered little whether the wood in them was resistant to decay or not. Now with better construction and less accidental breakage of airplane parts, instances are coming to the attention of the Forest Products Laboratory of parts needing replacement because of decay.

The fact is being recognized that many woods in common use for airplanes are not resistant to decay and may be destroyed very rapidly when exposed to unfavorable weather conditions.

Fortunately, there are woods whose value in aircraft has been demonstrated which are highly durable. Among these perhaps the most notable is Port Orford cedar. Two others which in tests made by the laboratory have proved very resistant to decay are southern cypress and California redwood. Douglas fir, white oak, and black walnut stand fairly high in durability. Mahogany and Spanish cedar are reputed to be very durable, but no tests have been made on them in the United States. Spruce, which has been the favorite wood for aircraft, is, unfortunately, appreciably less durable than any of the species mentioned. Likewise basswood, beech, birch, and maple may be classed with the less durable species.

The sapwood of practically all species decays readily. Hence in selecting wood for durability, only the heartwood should be accepted.

In cases where it is not practicable to use a naturally durable wood, the life of the wood part may be prolonged by giving it a preservative treatment. Sodium fluoride is a preservative which may be successfully used on parts that are to be glued. Coal-tar creosote, where its color and color would not be objectionable, may be used for parts that are not to be glued. Decay in struts ,propellers, and some other large members can be prevented by applying a coating of aluminum leaf. This keeps the wood dry, and dry wood does not decay.

Heavy patches on a belt throw it out of balance.

A double cut-off saw will save a lot of work and time.

Are You on the Lookout For Quality Veneers?

From our stock of high-grade veneers in Mahogany, American Black Walnut, Quartered Oak, Figured Quartered Gum and plain woods, we can meet your requirements for "something better" in veneers. Our large showrooms are at your service, drop in and make your own selection if you desire, or write, wire, or phone your order. Our quality and service will win your permanent patronage.

The Lumber Market

Domestic Woods

There is very little change in the local situation as reported last month. This is the quiet period between seasons. The demand continues fairly strong and available stocks are rapidly approaching the point of depletion. Operations in the woods are proceeding apace and indications point to a slight increase in production over 1919 probably amounting to from 10 to 25 per cent. Weather conditions have hampered operations in certain districts and the labor situation has not been very favorable, but on the other hand the scarcity and high values of lumber have induced a large number of small operators to have a try at the game. The lumberjacks seem unusually restless this season. There is a constant movement from camp to camp. In some instances the visits paid are very brief. If it were not for this feature the amount produced would be greater.

The American buyers are still scouring the field and securing all the stocks they can. To show how wide a demand there is for Canadian woods one local dealer was recently offered an order for 100,000 feet of 4/4 FAS. birch at a good price, from a concern in New Orleans. It is unusual for our lumber to travel so far south.

The building situation will likely have a marked effect on the lumber market during the coming season. There is no doubt about the demand for houses and other construction work but building operations are so costly that there is a marked hesitation on the part of many prospective builders to commit themselves to the high expenditure involved. If conditions are slack in the building field it will have a marked effect on demand. This effect may be far reaching for if houses are not built there will not be such a wide market for furniture. This situation will clarify shortly when the advent of warmer weather permits of building on a large scale. It would appear to be the part of wisdom not to delay purchases hoping for lower prices. Some who have stocks for sale do not appear to be anxious to clean them up. They would hardly act thus if lower values were expected.

Imported Woods

There is very little change reported in the American hardwood situation. While a few manufacturers claim to see indications of a falling off in demand the consensus of opinion seems to point to a continuation of the present strong features of the market. Even though the demand were to ease slightly production and stocks are so low that present prices would still maintain. Quotations remain at the same high level. In fact any changes that have been reported indicate slight advances. Some believe that the limit has been reached, but each time that opinion has been advanced, prices seemed to take another jump.

Conditions in the Southern producing centres have not improved. Wet and stormy weather still prevails. In the event of dry weather it would take many weeks for the swamps and roads to dry and logging conditions return to normal. The situation looks very serious from the production standpoint for unless there is a marked change for the better, southern woods will be scarcer than they were during 1919. At present many buyers are laying stress on the increasing scarcity of available stocks. This is likely to have only one effect on prices, upward. In the northern districts a feature is the compilation of comparative figures on stocks, showing that on February 1 there was less than 50 per cent. the amount of hemlock and hardwoods on hand, as compared with the same date last year. Some items show extraordinary decreases. Taking the situation as a whole indications are lacking which point to any relief or improvement in the existing state of affairs. Production appears to be hampered and low in nearly all producing centres, so with a continuation of the present demand or even a slight easing off in demand the present quotation will prevail and stocks will be scarce for a considerable period to come.

Kiln Drying of Green Hardwoods

Successful kiln drying of hardwood lumber green from the saw necessitates a very even control throughout the kiln at all times. This means that variations in temperature of even a few degrees or variations in relative humidity of 5-10 per cent. are seldom permissible. Such uniformity is possible only when the heating coil is properly drained, is relieved of air, and is distributing heat uniformly along its length.

It is the contention of the Forest Products Laboratory, Madison, Wis., that the return-bend heating coil system, by bringing about more uniform distribution of heat in the kiln, enables the operator to obtain quicker and better drying than is possible with the header-coil system, as it is generally installed.

The return-bend heating coil gives a practically even heat distribution under any steam pressure. The header-coil produces different temperatures at either end of kiln, the extent of variation depending on the steam pressure, length of coils, drainage, traps, etc.

Refractory hardwoods require low temperatures, and the lower the temperatures used, the more evident will be the difference in the results obtained with these two types of heating equipment. Under the same careful operation, green hardwood lumber may be turned out from kilns using the other type checked and over-dried at one end and molded and under-dried at the other end.

Will Call on Canadian Trade

C. W. Peters, vice president and manager of the lumber department of the Mercerau-Hawkins Tie Co., Huntington, W. Va., expects to call on the Ontario trade the week of March 22nd. Mr. Peters is well and favorably known to many of the Canadian hardwood buyers. We understand he has some attractive prices and good stocks of shipping-dry Southern hardwoods to offer, including about half a million feet of oak tie siding.

Hardwood Manufacturer Erects New Mill

Hunt, Washington & Smith, hardwood lumber manufacturers, Nashville, Tenn., are equipping a new mill at Blakley, Georgia. The new plant will consist of a band mill, planing mill and dry kilns. Nothing but long leaf yellow pine will be cut at the new mill, which will be in operation in about three months. W. R. Youmans, Parkview Hotel, Toronto, is the Canadian representative of this firm.

Information and Inquiries

You are cordially invited to make use of this department

Machinery for Spring Clothes Pins

Nelson, B. C., Feb. 27, 1920.

Editor "Canadian Woodworker:"

The machines mentioned in your reply to my enquiry of Jan. 31st, which was published on page 86 of your February issue, are for making the ordinary slotted clothes pin. The equipment we are in the market for is for making spring clothes pins and from the cuts we have seen must be a different type of machine. If you can supply this information we will greatly appreciate it.

Yours truly,
T. H. Waters Co.

From the enquiries we have made it would look as if this equipment is not on the market. One machine manufacturer stated that he has been unsuccessfully trying for some time to find anyone who makes this line and thinks that the manufacturers of the pins make special equipment of their own design. We think that these pieces could be successfully made on a sticker by using special heads with milled cutters that would give a shearing cut and perhaps making some special alterations to the machine itself. The stock would be cut to suitable lengths and fed through edgeways. One manufacturer of slotted pins has adopted this method and there does not seem to be any reason why the same method should not be applicable to spring pins. The springs could either be purchased or a wire forming machine installed to make them on the premises.

Operation of Dry Kiln

Silver Hill, Ont., February 21st, 1920.

Editor "Canadian Woodworker:"

I am going to manufacture oak flooring and am installing a dry kiln to dry the oak. If I use the exhaust steam and only have heat on in the day time will the lumber dry properly? Is it advisable to rip the stock before placing it in the kiln? How long will the dried oak remain dry if allowed to stand in the kiln without the heat being turned on? I figure on putting the pipes along each side. Do you think this will give good results? Awaiting your reply, I am,

Yours truly,
Jas. Gilkes.

Having the heat only during the day time will dry your oak but much better results may be obtained if it is possible to keep the steam on both day and night, thus maintaining an even temperature throughout the 24 hours. It is more economical to keep the heat on all the time; as when this is done the lumber is dried in a much shorter period and in addition the time lost in heating the cold kiln each morning is saved. Again it has been found that when lumber is subjected to heat during the day and allowed to cool at night, it is very hard on the stock. This is specially true if green lumber is being dried. In the old days when all the lumber was well air dried, allowing the heat to drop at night did not have a marked effect on the results.

The ripping of the oak to rough size is a good idea as it means that the drying may be accomplished quicker than if the larger pieces were put in the kiln.

The length of time dry lumber will remain dry can only be determined by experiment. Oak is a wood that absorbs moisture very quickly, and as soon as the stock has cooled, it commences to take up moisture from the air. If you find it necessary to store dry lumber in the kiln for any length of time, it would be a good idea to turn the heat on again for a day or two before removing the lumber to the factory.

Instead of putting the pipes along the wall, you would possibly secure better results by putting them in a pit underneath the car or pile of lumber, and building a fresh-air duct, having an outside connection under the pipes. This should give a good circulation of warm air up through the stock you are drying. If the pipes are placed along the sides, there is a possibility that you may get a circulation around the pile rather than through it.

Wood Graining Equipment

St. Jean Chrysastome, P.Q., Feb. 20, 1920.

Editor "Canadian Woodworker:"

Would you be kind enough to favor us with the names of the manufacturers who make graining machines and plates for use on hardwoods. This information will be very much appreciated.

Yours truly,
Philipe Roberge.

Graining machines and plates for use on all kinds of woods are made by the Hugh Silver & Sons, Prescott, Ont., and the Grand Rapids Panel Co., Grand Rapids, Mich. The plates are made to imitate such woods as plain and quartered oak, walnut and mahogany.

Information Wanted on Small Dry Kiln

A subscriber writes in stating that they operate a small factory on sash, doors and building material, using about 125,000 feet of lumber annually. The kiln they have at present is not giving satisfactory service so they are considering installing a new one. They want to know what size and shape to build, the best arrangement for heating whether steam pipes or coil and hot blast, how to secure an adequate ventilation and other information that will enable them to instal and equip a first-class kiln.

Will you kindly send in to the "Canadian Woodworker" your idea, giving details, of the best kiln for them to instal.

Box Shooks Wanted

A British importer is desirous of securing quotations from Canadian box manufacturers on shooks for 500,000 cases for direct shipment to Greece. The shooks required are of whitewood, planed on one side and having the following specifications: tops and bottoms 19½ in. x 10 in. x ⅜ in.; sides 19½ in. x 8 in. x 7/16 in.; ends 9¼ in. x 8 in. x 9/16 in. The name of this importer may be had by writing the publishers of this journal.

Wood kept permanently dry will last longer than that exposed to climatic conditions.

Cleanliness is essential if you want your band-saw joints to be of real service.

100,000,000 Feet a Year

WITH the completion this month of our double band mill at Vicksburg, Miss., we will have a total yearly production of 100,000,000 feet of Southern Hardwood Lumber. This makes five band mills at Vicksburg—eight band mills in all.

Thus we are doing our utmost to take care of customers' needs with "More Than Service" our outstanding endeavor.

The Muskoka Wood Mfg. Co., Limited, Huntsville, Ont., are considering adding to their dry kilns during the coming season.

The plant of the Ontario Spring Bed & Mattress Co., London, Ont., was recently damaged by fire. The loss was very small.

The McCarthy Aerial Service, Toronto, contemplate erecting an airplane hangar at New Liskeard, Ont., at a cost of $10,000.

The Engel Upholstered Furniture Co., Waterloo, Ont., is the name of a new firm who recently entered into the production of upholstered goods.

Waterloo Furniture Co., Limited, Waterloo, Ont., are making additions to their plant. This is to meet the spring demand for their line of furniture.

The Muskoka Wood Manufacturing Co., Huntsville, Ont., recently purchased the Vernon House, and are remodelling it as a lodging house for their employees.

A company known as Ramsay, Barron & Co., Toronto, Ont., has been formed to take over the cabinet-making business conducted in Toronto by J. W. Ramsay.

The Western Aeroplane Co., Limited, Moose Jaw, Sask., has been incorporated to manufacture and deal in aeroplanes and to conduct commercial flying. Capital $50,000.

The Globe Furniture Co., Limited, Waterloo, Ont., have been authorized by supplementary letters patent to increase their capital stock from $300,000 to the sum of $500,000.

Salter & Co., Edmonton, Alta., who for years have carried on an upholstering and cabinet-making business, have changed their firm name to Thornton, Perkins & Co.

Recent Montreal registrations include Louis Pistono & Co., cabinet makers; Canadian Pattern & Woodworking Co.; and Silver Bell, manufacturer of pianos and gramophones.

The McKinney Lumber Co., Woodstock, Ont., intend to erect a sash and door factory as soon as the weather permits. The expenditure will likely run from $20,000 to $40,000.

The Newall Mfg. Co., Prescott, Ont., manufacturers of curtain poles, bathroom fixtures, and upholstery hardware, have let a contract for alterations and additions to their plant.

The Board of Education of Sault Ste. Marie, Ont., are equipping a manual training department in their new technical school, and are in the market for woodworking equipment.

The Peppler Upholstering Co., Kitchener, Ont., were recently organized to manufacture and deal in furniture and upholstered goods. C. H. Peppler is the head of the new concern.

The carriage makers of Alberta recently met in convention at Calgary, Alta., and elected the following officers: Walter Hobbs, Edmonton, president, and A. Jessiman, Didsbury, secretary.

The Gray Furniture Co., Limited, Winnipeg, Man., was recently incorporated to take over the business of the Gray Furniture Co., and to manufacture and deal in furniture of all kinds. Capital $75,000.

The Columbia Handle Co., London, Ont., whose plant was recently destroyed by fire, contemplete erecting a new factory at a cost of $25,000. They are in the market for the necessary equipment.

Recent British Columbia incorporations include the Robertson & Hackett Sash & Door Co., Limited, Vancouver, B. C., capital $50,000, and the Acme Box Co., Limited, Vancouver, B. C., capital $15,000.

The Porcupine Pulp & Lumber Co., Limited, Hoyle, Ont., contemplate equipping a woodworking plant and are in the market for the following machines:—lathe, tenoner, edger, saw-tables, band saw and re-saw.

The saw and planing mill of Malloy & Brian, Haliburton, Ont., was completely destroyed by fire. The loss amounts to about $40,000. The plant will be rebuilt and new equipment installed as soon as possible.

W. J. Patterson, Newmarket, Ont., is manufacturing a line of phonographs, known as "Harmonola Phonographs." These instruments embody many of the newer features and are being sold at very reasonable prices.

It is expected that a by-law will be submitted to the ratepayers of Cobourg, Ont., in the near future, regarding the establishment of a large furniture factory by the Langslow, Fowler Furniture Co., of Rochester, N.Y.

The Office Specialty Mfg. Co., Limited, Newmarket, Ont., manufacturers of office furniture of all kinds, have acquired a site and are contemplating erecting an addition to their plant. Definite plans have not been formulated.

A. I. Root Co., Medina, Ohio, have decided to locate in Ingersoll, Ont., and have secured suitable premises in the Noxon Building, where they will install all equipment necessary to produce their line of beekeepers' supplies.

The Walter Dean Canoe & Boat Co., Limited, Toronto, Ont., were recently incorporated to manufacture and deal in boats and canoes. Two of the incorporators are W. J. Dean and E. M. Dean, of Toronto. Capital $100,000.

Thibault, Limitee, Montmagny, P. Q., have been incorporated to deal in lumber, furniture, doors, sash, and other wood products. R. Thibault and N. Letourneau, of Montmagny, P. Q., are two of the incorporators. Capital $99,000.

The Montreal Heel Co., Limited, Montreal, P. Q., have been incorporated to carry on business as manufacturers of heels and trunks. Among the incorporators are J. E. Dupre and N. Belair, both of Montreal, P.Q. Capital stock $49,000.

Shaienks Incorporee, Levis, P.Q., have been incorporated to take over the business conducted by Shaienks & Frere, and to manufacture such items as furniture, toys, wooden articles and household goods of all kinds. Capital $99,000.

The Karn Piano Co., Limited, Toronto, Ont., have been incorporated to manufacture and deal in pianos, phonographs, and other musical instruments. Capital $500,000. J. E. Hoare, piano manufacturer, Toronto, Ont., is one of the incorporators.

In an effort to cope with the shortage of houses in Elmira, Ont., the Elmira Planing Mill Co., Limited, accepted a contract from the Elmira housing commission, not only to supply the necessary material, but to erect and turn over six houses complete.

The Phonola Company of Canada, Limited, Elmira and Kitchener, manufacturers of phonographs, have established a repair department at their Elmira plant. This department will take care of the repairs sent in by their customers throughout Canada.

A fire occurred in the plant of the National Cabinet Co., King St., Toronto, manufacturers of phonographs. The damage, which amounts to $5,000, was confined chiefly to cabinets finished and in the course of manufacture. The loss is fully covered by insurance.

The carriage factory of Coady Bros., Toronto, Ont., was completely destroyed by fire. The loss entailed amounts to about $50,000. When the flames reached the room where the varnish and paints were stored a voilent explosion occurred, wrecking the entire building.

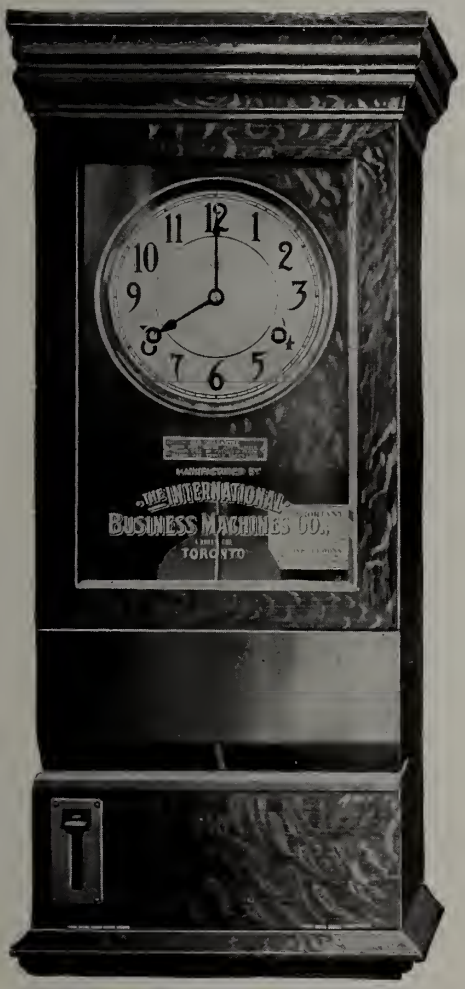
The Windsor Phonograph & Record Co., Limited, Mon-

The Biggest Thing in a Thousand Furniture Plants



A Modern International "Job" Time Recorder

It's an International Job Time Recorder and its bigness is measured by its importance. Thousands of them are in daily use in industries of the world.

It will print an accurate, unalterable and undisputable time record of every job that is done in your factory. It does not beat the worker—neither can it be cheated by the shirker.

It is the watch dog of your factory costs and a true guide to establishing a proper selling price for your products.

Your factory equipment cannot be complete until every department is fully equipped with this International Job Time Recorder.

Write, wire or phone for full particulars.

treal, P.Q., have been incorporated to manufacture and deal in phonographs, records, pianos, musical instruments and furniture. Capital $1,000,000. John Kerry and Aimie Bruneau, of Montreal, are among the incorporators.

Taylor Brasco, Limited, Hamilton, Ont., have been incorporated to construct, install and repair store fronts and store, office and showroom equipment of all kinds. Capital $50,000. J. D. Moser, manufacturer, and T. R. Sloan, barrister, of Hamilton, are two of the incorporators.

The upper storey of the E. B. Eddy match factory in Hull, Que., was recently damaged by fire to the extent of several thousand dollars. There was considerable excitement among the three hundred girls employed in the factory at the time of the blaze, but all escaped with safety.

Langstaff, Schurg & Co., Limited, Emo, Ont., manufacturers of boxes and box shooks, have recently installed a Standard wire bundler. They contemplate adding several new machines which will necessitate an entire change of system, but this has not been definitely decided on as yet.

The Belleville Sash & Door Co., Limited, Belleville, Ont., have been incorporated to manufacture and deal in sash, doors, finishing material and wood products of all kinds. R. J. Graham and J. Bone, manufacturers, of Belleville, Ont., are two of the incorporators. Capital $40,000.

The Hartland Lumber Co., Limited, Hartland, N. B., have been incorporated to manufacture and deal in furniture, flooring and building material. A general lumber business will be conducted in connection. Capital $18,000. H. H. Hatfield and R. W. Cameron, of Hartland, N. B., are among the incorporators.

A company known as the Westminster Furniture Mfg. Co. has been organized in New Westminster, B.C., to manufacture a line of furniture. It is the intention to utilize native hardwoods, chiefly maple and birch. British Columbia should present a good field to the manufacturer who produces a first-class line.

Laminated Materials, Limited, Sapperton, B. C., manufacturers of three-ply and veneers, plan on erecting another plant. An option has been secured from the New Westminster council on a suitable site and a site in Prince Rupert, B. C., is also being investigated. In all probability both the old and the new plant will be operated.

The Regina Sash & Door Co., Regina, Sask., contemplate erecting a factory 60 ft. by 265 ft., early this spring. The building, exclusive of equipment, will probably cost about $40,000. A separate dry kiln will likely be constructed. The intention is to install practically all new equipment. When in operation about fifty men will be employed.

The Sterling Bay Lumber Co., Tenby Bay, Ont., at a meeting held recently, decided to purchase machinery and other equipment for the purpose of manufacturing a line of furniture. The following officers were elected at this meeting: President, M. Mickalsen, vice-president, Peter Bergan, secretary, J. O. Johnson, treasurer, Peter Bergan.

The Rhodes Curry Co., Limited, Amherst, N. S., who conduct a large general woodworking business, have been reorganized and will in future be known as the Rhodes, Curry Limited. C. D. Dennis is one of the principals in the new company, and will hold the position of managing director and secretary treasurer. This business was founded in 1877.

The Singer Manufacturing Co., St. Johns, P.Q., have about completed the installation of a battery of modern dry kilns. These kilns, of which there are seven, are 104 feet long and 8 feet 6 inches wide, and will accommodate seven cars containing 4,500 feet of stock, or 31,500 feet per kiln, giving a capacity of 290,500 feet for the full compliment of kilns.

The Victor Woodworking Co., Amherst, N. S., did, according to the manager, A. H. Miner, an unusually good business during 1919. He stated that their business increased from month to month, and he believes that this increase shows that the public realize that the present scale of prices does not represent a temporary increase, but rather indicates the level of permanent values.

At the annual meeting of the Office Furniture & Supplies Co., Limited, Brockville, Ont., which was held recently, it was decided to erect additions and add equipment that would about double the present capacity of the plant. The following officers were elected:—President, H. W. Fleury, Aurora, Ont.; vice-president, Hon. G. W. Fowler, Sussex, N. B.; managing director, H. K. Bowes, Brockville.

W. D. Midmer, Limited, Napanee, Ont., has been incorporated to manufacture hardwood flooring, building material and wood products of all kinds and to take over as a going concern the business and plant of W. D. Midmer. Capital $100,000. W. D. Midmer and Philip Woodcock, of Napanee, are two of the incorporators. A ten acre site has been secured and new factories and additions will be erected as required.

The Canadian Wirebound Boxes, Limited, with headquarters in Toronto, has been granted a charter. Capital stock is $300,000. The company is empowered to carry on the business of manufacturing and dealing in wirebound boxes and other wood products. Other powers are to engage in the planing and dressing of lumber and building materials of various kinds. The incorporators of the company are L. A. DeLaplante, and others, of Toronto.

The Goderich Mercantile Co., who took over the old Wheel Rigs factory at Goderich, are making good progress. At present they are manufacturing a line of baby carriages, rattan furniture, go-carts, toys, etc., the quantity produced being limited only by the raw material attainable and the labor situation. The officers of the company are Thos Pritchard, president, W. T. Miller, vice-president, and A. F. Sturdy, secretary-treasurer.

Modern Wood Products, Limited, have been granted a charter, with a capital stock of $60,000, and head office in Milverton, Ont., to carry on the business of a planing mill, and to purchase, sell and manufacture all classes of building materials, as well as to make and deal in furniture, lumber and all kinds of wood products. The incorporators are John Boshart and Enos Nafziger, manufacturers; A. C. Clemens, merchant; Norman H. Honderich, traveller, and John C. Grosch, all of Milverton.

The plant of the Meaford Furniture Co., Limited, Meaford, Ont., narrowly escaped destruction by fire. The blaze started in one of the dry kilns and spread through the other three kilns. The sprinkler system, together with the town fire brigade, kept the flames from spreading to the main buildings, and also saved the greater part of the 144,000 ft. of lumber which was in the kilns. The dry kilns and lumber were damaged to the extent of several thousand dollars. Then there is the additional cost of re-drying the lumber saved. The loss is fully covered by insurance.

J. N. Archambault, Limited, with a capital stock of $50,000, and headquarters in Montreal, has been granted a federal charter to take over as a going concern the business of J. N. Archambault, wholesale and retail importer and exporter, and to manufacture and deal in furniture of all kinds. The new concern is empowered to carry on business as manufacturers, merchants, importers and exporters of woodenware, furniture, gramophones, toys, etc. The company is composed of J. N. Archambault, Philippe Trottier, Joseph E. Nantel, Henry Prevost, of Montreal, and others.

The Casper Heimbecher Furniture Co., of Elmira, Ont., has been taken over by Messrs. Snyder Bros., of Waterloo. This business, which until October, 1919, was known as Heimbecher & Jung, specialized in the manufacture of frames for upholstered furniture, and Snyder Bros. were one of the largest customers. Messrs. Snyder Bros. plan on continuing the operation of the plant they have just acquired; in fact its output will probably be increased, and the whole output will be utilized by their upholstering plant in Waterloo. In all probability Henry Heimbecher, son of the former proprietor, will be placed in charge.

A company represented by Capt. E. V. Argon is negotiating for the purchase of the shipbuilding yards which were operated by the Foundation Co. of B. C. Limited, at Victoria, B. C. While the identity of the company or the interests behind the deal have not been disclosed, the plans of the new concern call for the construction of forty or more wooden steamships. The vessels will be larger than those constructed by the Foundation Company for the French Government, being all from 4,000 to 4,500 tons register. The construction of these steamers will provide work for the yards for several years, and might develop into a permanent industry, including the possibility of the construction of steel ships.

The employees of the Meaford branch of the Seaman, Kent Company, manufacturers of hardwood flooring, who were out on strike, have returned to work. Owing to the large number of orders on the books, the men were notified that it would be necessary for them to work ten hours a day and Saturday afternoons until the company had caught up with its work. They were offered time and a quarter for

all overtime. This was refused, the men demanding time and a half. Following this, the men, on going to work one morning, found a notice which stated that if they were not prepared to accept the company's offer and work the ten hours, they could look for other employment. As a result all the men walked out. After being out a few days, the men agreed to accept time and a quarter for overtime for five days a week, and time and a half for Saturday afternoons for a period of one month, during which time arrangements will be made for operating a night shift so that all overtime will be eliminated. The bonus which the company has been paying has been discontinued, and in its place a straight advance of 10 per cent. has been made in wages.

Personal

W. P. McClung, cabinet maker, recently passed away in Toronto.

Jas. Morrison, of Morrison & Co., carriage manufacturers, Ingersoll, Ont., recently passed away.

E. Ziegler, who recently acquired an interest in the Harriston Furniture Co., Harriston, Ont., has moved his family from Kitchener to Harriston.

The death occurred recently of Mr. J. D. A. Senecal, manager of the Willis piano plant at Ste. Therese, Quebec. The late Mr. Senecal has been connected with that firm for the last fifteen years.

Jas. Christie recently passed away in St. John, N.B. Mr. Christie was president and manager of the Christie Woodworking Co., Limited, of that city, manufacturers of store and office fixtures and general woodworking.

J. F. Thompson, who holds a responsible position with the National Table Co., Owen Sound, Ont., was elected by acclamation to the position of first deputy reeve of Owen Sound. Mr. Thompson has been a member of the Town Council for many years.

J. E. Gagnon, of Ottawa, recently passed away while on a visit to Montreal. During the past twenty years Mr. Gagnon had been in the employ of the Ottawa Car Mfg. Co. For the greater part of this period he held the position of foreman of the cabinet department.

Major James Brechin, former B. C. Lumber Commissioner in Eastern Canada, who resigned some time ago and left Toronto for the west, has been appointed private secretary to Hon. Dr. King, Minister of Public Works, Victoria, and has entered upon his new duties.

Angus Morrison, Sr., recently passed away at his home in Ingersoll, Ont. He was well and favorably known, having conducted a carriage-making business for many years, and in addition he took a great interest in public affairs, serving as member of the council for a number of years.

The many friends of J. B. Jarvis, of the Elgie & Jarvis Lumber Co., Limited, Toronto, are extending sympathy to him on the death of his wife, who passed away recently from pneumonia. Previous to her own illness she had been nursing her children, who were down with influenza. Mrs. Jarvis is survived by her husband and two children.

Harry E. Turnbull, manager of Turnbull & McManus Ltd., sash and door, and general woodworking wholesalers of Winnipeg, left recently for the Pacific Coast on an extended business trip. Mr. Turnbull does not believe that lower prices for lumber and building supplies will prevail during 1920, owing to heavy domestic and foreign demand.

James G. Kent, President of Kent, McClain, Limited, recently passed away at his home in Toronto. Mr. Kent was born at Selkirk, Ont., about 63 years ago, moving from there to Hamilton and later to Toronto. Some fifteen years ago he became president of the Kent, McClain show case business, and had been actively connected with this firm ever since. His death was rather unexpected, for while he had been sick for some time, he had improved and was preparing to pay a visit to the office. John G. Kent, general manager of the Canadian National Exhibition, is a brother.

Olson Units for Ford Trucks

The majority of the lumber dealers, furniture dealers and box and barrel manufacturers should be interested in the new Olson equipments for Ford chassis, which allow the mounting of bodies of special length for use in handling lengthy or bulky products.

Somewhat more than a year ago the Swedish Crucible Steel Co. of Canada, Limited, Windsor, Ont., began manufacturing frame extension units for the Ford Truck. At first this business was only to supply the local demand, but to-day Olson equipments are in use in every province of the Dominion. With recent additions to this line it is now possible to secure an extended frame and drive shaft giving any length wheel base desired for use on a light truck of this type.

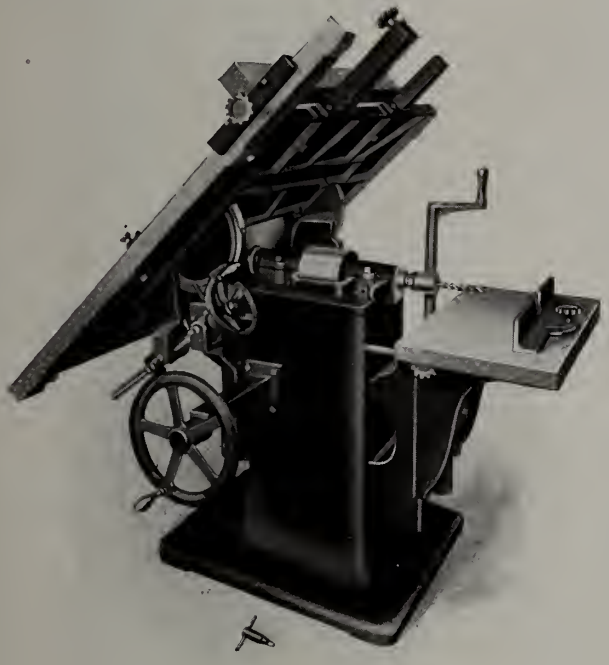
There are very few concerns in the woodworking industry, to-day, who have not work for at least one truck with a carrying capacity of around one and one-half tons, which is the rating of these trucks under ordinary road conditions. Heretofore it has been necessary to invest several thousand dollars in a large heavy duty truck, in order to obtain sufficient wheel base to be of any value and real service for hauling lumber and other bulky products. This investment has deterred many from purchasing truck equipment, but to-day with the proper type Olson equipment it is possible to use the standard Ford truck for this class of work and secure the advantage of its well-known economy of operation and exceptionally low initial cost.

Four types of Olson extensions are now manufactured and it is an easy matter to secure the proper body type for particular requirements. Truck bodies may be built any width ordinarily required, but the difficulty has been to get sufficient length. The Olson equipment overcomes this trouble. It is made in different lengths to accommodate bodies up to 15 feet in length. In addition, there is supplied the No. 12 equipment, which does not require a body, but is equipped with three special rollers of the proper size. These greatly facilitate the unloading of lumber in that the load may be rolled off in a couple of minutes in place of the slow and costly method of unloading by hand.

Elect Officers for Current Year

At a meeting of the stockholders of the Buffalo Forge Co., Buffalo, N. Y., the following gentlemen were elected to office:—Henry W. Wendt, president; Edgar F. Wendt, vice-president and treasurer; Henry W. Wendt, Jr., Vice-president and secretary; C. A. Booth, vice-president and sales manager. The directors for the ensuing year included the above named officers, and in addition H. S. Whiting.

An Excellent Machine for Furniture and Cabinet Work



The "Famous" No. 16 Variety Saw Bench with boring and mortising attachment will do much to increase your output in your furniture and cabinet shops. Accuracy is a main factor in its operation, while the roughest class of work is handled with the same degree of efficiency.

Write us for further information regarding the "Famous" No. 16 Variety Saw Bench and many other machines that you may need and are included in our complete line of woodworking machinery.

Accidents to Railroad Employees Decrease

Records compiled by the Safety Section of the Division of operation, United States Railroad Administration, recently made public by the Director General, show that during the first ten months of 1919, 1,107 fewer employees were killed in accidents and 25,930 fewer employees were injured during the corresponding period of 1918. Since the Safety Section had only begun to function in January, 1919, these figures are considered evidence of the application of safety practices.

NAPCO WATERPROOF GLUE

No wastage

Applied cold—and mixed cold

Profitable in its saving

Consistent in all grades of work

Odorless in the glue room

NAPCO is absolutely uniform. It eliminates waste, is easily applied, is impervious to water, and never lets go.

NAPCO joints are as strong as the wood.

H. LEFEBER

Lewis Building, Montreal, Que.

SOLE AGENT FOR CANADA

Vegetable Glue

We desire to enter into correspondence with parties now using, or those contemplating using, VEGETABLE GLUE in the Woodworking Industries of Canada.

IF YOU ARE NOW USING ANIMAL GLUE IN YOUR WORK WE CAN SHOW YOU CONCLUSIVELY THAT YOU CAN MAKE A LARGE ANNUAL SAVING, BESIDES TURNING OUT SUPERIOR WORK BY SUBSTITUTING VEGETABLE GLUE.

We make VEGETABLE GLUE in a number of grades to meet every and all requirements FROM THE FINEST PIANO OR CABINET WORK TO THE CHEAPEST FORM OF BOX SHOOKS, and where the consumption will warrant this, are prepared to furnish the entire equipment of machinery necessary to apply the Glue.

We especially solicit your enquiries and correspondence.

Do not be coerced into entering into contracts with anyone claiming a basic Patent on the use of Vegetable Glue. THERE ISN'T ANY SUCH THING. We operate under our own Patents and guarantee you protection against any and all suits for infringement that may be threatened or brought against you.

FURTHERMORE, WE CAN GIVE YOU REFERENCES TO SOME OF THE LARGEST AND MOST SUCCESSFUL WOODWORKING ESTABLISHMENTS IN THE UNITED STATES WHO HAVE USED OUR PRODUCT FOR YEARS AND WILL TELL YOU THAT OUR GLUE GIVES UNIFORMLY PERFECT RESULTS AND IS BETTER THAN ANY OTHER PRODUCT MADE.

That is a strong claim but we will prove it to be true.

In order to meet the present abnormal conditions in the matter of exchange, WE HAVE MADE ARRANGEMENTS WITH CANADIAN BANKERS TO HAVE YOU PAY ALL OF OUR BILLS IN CANADA IN YOUR OWN CURRENCY AT PAR, which at present rates of exchange ruling, will mean a SAVING OF FROM EIGHTEEN TO TWENTY PER CENT. on your requirements.

WE BELIEVE IN THE FUTURE OF YOUR GREAT COUNTRY and are ready to back our faith by putting her manufacturers on an equal footing with our own by meeting the temporary handicap of abnormal exchange, and investing your payments in CANADIAN VICTORY BONDS and hold them ourselves until the restoration of normal conditions permits a realization without loss to either you or ourselves.

We send expert demonstrators to your plant at our expense to properly start you in the use of OUR UNEQUALED VEGETABLE GLUE.

Write us for particulars.

Victor G. Bloede Co.

BALTIMORE, M.D., U.S.A.

Perkins Vegetable Glue

The Glue of No Regrets

Process and Product Patents covering Perkins Glue were granted July 2nd and March 19th, 1912, and have been held valid and infringed by the United States Circuit Court of Appeals. Patents have also been granted in Canada, England, France, Austria and Germany.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without re-sharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,
Per O. H. BRUBAKER, Manager.

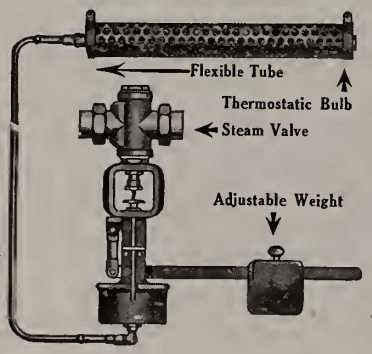
The Better Way of Controlling Kiln Temperature

The world wants finished products now. All costs are rising and your problem is to produce more. Begin by insuring your wood as it goes into the kiln. Every inch of green wood has cost you real money and represents two values—raw value and finished value. Don't allow fluctuating kiln temperature to tamper with these values. Prevent fluctuating temperatures by equipping your kilns with

Powers Heat Regulators

As long as steam pressure is maintained Powers Regulators operate. Their operation insures correct kiln temperatures, saving of fuel by using only necessary heat, saving of labor by releasing men from watching thermometers and



The Powers Regulator No. 15

Specially designed to control temperature in dry kilns, ovens, varnish and dry rooms, etc. Requires no outside power for its operation.

valves, saving of material by cutting down the loss from case hardening, warping, and checking. They also speed up the drying by fully 25 per cent.

During our more than thirty years of experience in automatic temperature control we have gathered some very profitable information for the woodworking industry. Let us show you how to save money on your kilns or other apparatus where heat is a factor. We are cheerfully at your service. Write us today.

The Magazine Feed Does It!

Simply dump a gross of screws (either wood or machine) into the hopper. The machine does the rest.

Speed and accuracy combined is the result of driving screws by **Magazine Fed** Automatic Screw Driving Machines. They drive screws the entire length revolvingly which gives an increased holding power of 49 per cent. over screws driven by hammer. Think what this would mean to your plant and product. Greater production through lightning swiftness, due to the magazine feed, accuracy and security in every screw driven. Reynolds' Automatic Magazine Fed Screw Driving Machines will drive from 1,000 to 2,000 ordinary screws in one hour and under the operation of your newest hand. Simplicity in construction yet thoroughly efficient in operation. Investigate the possibilities of these machines in your plant.

THE REYNOLDS MACHINE CO.

Department C

MASSILLON, OHIO - U. S. A.

Hey, Bill! when 'yer goin' t'unload that truck?

"Fred's waiting for a bunch of stuff upstairs and the "Sup's" raising "cain" because it wasn't at the sanding machines an hour ago. I can't move it by hand, and it won't move itself.

"Well, if you've got to have this truck you'll have to unload it yourself; I haven't got time."

"Nothing doin'—that's your job!"

. . . . . .

If there's much inter-department trucking in your plant, you know that sort of back talk is no exaggeration.

Result: Time of skilled mechanics and machines wasted, because of the truckman's idea of where his job ends, and because of old-style trucks that have to be unloaded piecemeal, before they can be used again.

Away with it. Install one or two Tranco Trucks and a battery of platforms. With

A TRANCO ELEVATING TRUCK

a man can easily move loads up to 3,000 pounds, dump them without piecemeal unloading, and be free for the next job at once.

The principle of their construction and operation will appeal to all reasonable men. Write now and get full particulars.

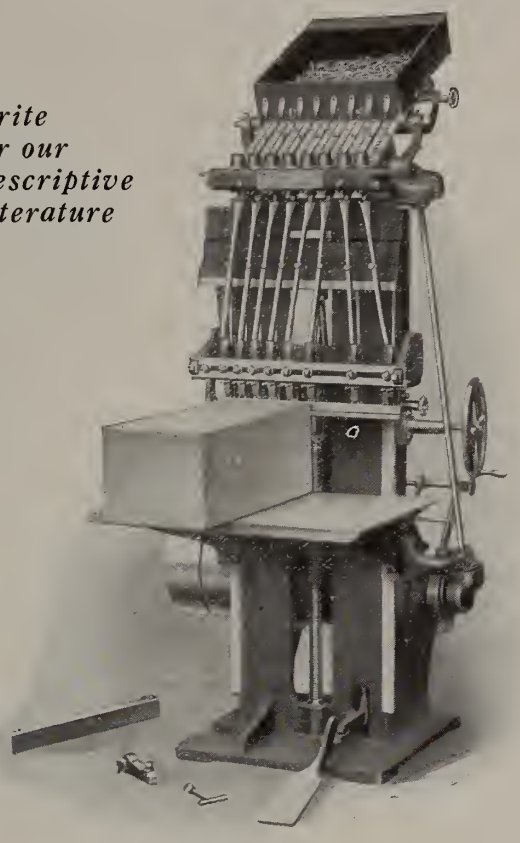
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A . ROCHESTER, N.Y.

Just a Few Users—

Robert Bury Co. Canada, Limited, Toronto, Ontario.

Batts, Limited, Toronto, Ontario.

Gibbard Furniture Company, Napanee, Ontario.

Langmuir Manufacturing Company, Toronto, Ontario.

Gardiner Lumber Company, Galt, Ontario.

Irvin Lumber Company, Toronto, Ontario.

OLSON FRAME EXTENSION

For Increased Capacity and Decreased Costs

The Olson Frame Extension is built expressly for increasing the carrying capacity of any Ford truck. Designed and built to give perfect balance which results in smooth, easy operation that is most suitable for the transportation of lumber, furniture, etc., for short or long distances.

Olson Frame Extensions are sold by all Ford dealers. Write our nearest branch for further information.

Swedish Crucible Steel Co. of Canada, Limited, Windsor, Ont.

Branches:—614 Excelsior Life Bldg., TORONTO. 285 Beaver Hall Hill, MONTREAL.

Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Carver, 5-spindle, Moore.
Door clamp, Fay-Egan, heavy.
Edgers, two, three and four saws.
Glue cookers and retainers. Glue spreaders.
Hogs, two, Mitts & Merrill.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Knife grinders, two 32-in., F. & E.
Lathe, Ober spoke and handle, almost new.
Lathes, Mattison, No. 8 auto; No. 6 block mach.
Lathes, speed, eight, mounted on iron bed.
Lock-corner machine, Morgan No. 8, full set.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, end, Sherman, fine condition.
Matcher, 24x6-in., 3 and 4 sides.
Automobile spoke machines, Defiance, complete set.
Band resaw, 50-in., Fay & Egan, tilting rolls, full set of filing room tools.
Molder, Smith 14-in. outside, latest style, practically new.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan No. 184, 12-in. outside.
Molders, inside, 13-in. American and Woods.
Mortiser and router, Fay & Egan No. 124.
Mortiser, chain saw, New Britain No. 1, 25 chains.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type.
Nailers, two, Morgan No. 8, used three months.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread.
Pony planers, 16, 20 and 24-in.
Relisher and mortiser, Greenlee.
Rip saws, self-feed, Hoosier, F. & E., Greenlee.
Router for stair stringers, H. B. Smith, flexible arm with adjustable table and forms.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30 and 42-in. Columbia; 30, 42 and 48-in. Invincible; 30-in. double Invincible.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, B. & M. double-end, also several single-end tenoners with and without copes.
Timber sizer, Fay-Egan s4s, 17x12-in.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

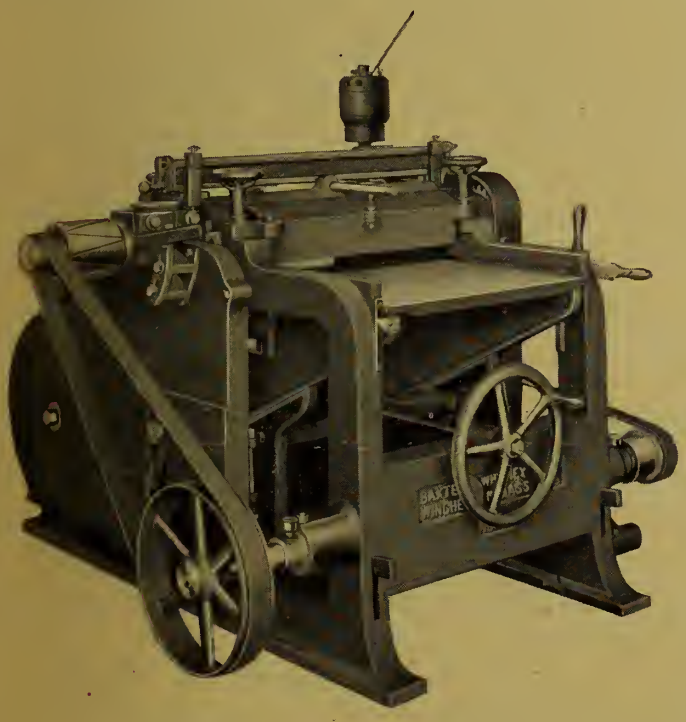
THE WHITNEY

30" No. 32 Single Planer

with Round Cutter Head and Electric Grinder

has special features that appeal to every woodworker, such as the



30" No. 32 Single Planer—Round Cutter Head and Motor Grinder

RIGID FRAME with ample weight of metal.

BED raised and lowered on Solid Wedges operating on wide tracks.

HARDENED CENTRE TABLE made extra thick.

AUTOMATIC CHIPBREAKER working concentric with the cutter head.

SIDE CLAMP CUTTER HEAD BOXES easily detached.

CUTTER HEAD with long bearings of large diameter.

REMOVABLE BABBITTED FEED SHAFT BOXES.

SECTIONAL FEED ROLLS to handle narrow and uneven stock.

MACHINE CUT GEARS.

Whitney Planers are equipped with motors coupled direct to the cutter heads when desired.

These machines can be furnished with two or four-knife Square Cutter Heads or four-knife Round Cutter Heads, Flexible or Sectional Chipbreaker and Motor-driven Grinders and Devices.

Write us for further information about this machine.

Model 1-D Portable Drill

HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to $\frac{3}{16}$". Wood and alloys, 0 to $\frac{1}{2}$".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center $\frac{23}{32}$".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

Garlock-Walker's List of Woodworking Machinery in Stock

(Balance of Equipment of Toronto Furniture Company's Plant)

Manufactured by

American Wood Working Machinery Co.

1—AMERICAN FIG. 640, FOUR SIDES BOSS TIMBER SIZER, capacity 30" wide, 20" thick, 8 feed rolls, straight knives on all heads, only three years old, as good as new.

1—AMERICAN No. 229, FIG. 660 15 x 6 HARDWOOD FLOORING MACHINE, equipped with six knife top and bottom heads, knife setting and jointing attachments, thoroughly overhauled, in first class condition.

1—AMERICAN No. 229, FIG. 660, 15 x 6 HARDWOOD FLOORING MACHINE, same as above.

1—AMERICAN FIG. 8442, No. 26, 10" x 4" FOUR SIDED FAST FEED OUTSIDE MOULDER, with slip on and off top and bottom heads, latest type machine, complete, overhauled and in A1 condition.

1—AMERICAN FIG. 8442, No. 26, 10" x 4" FOUR SIDED FAST FEED OUTSIDE MOULDER, same as above.

1—AMERICAN FIG. 8412, No. 22, 10" x 4" FOUR SIDED OUTSIDE MOULDER, in first class condition.

1—AMERICAN FIG. 8521, No. 5, 8" x 4" HOUSTON FOUR SIDED OUTSIDE MOULDER, overhauled and in A1 condition.

1—AMERICAN FIG. 8601, 6" x 4", FOUR SIDED OUTSIDE MOULDER, new.

1—AMERICAN FIG. 5014 No. 111, 54" BALL BEARING BAND RESAW, carrying blades up to 7" wide, capacity 30" vertically, using extended rolls, 22" without extended rolls; from ⅛" to 20" horizontally, will centre split a 16" timber; cut a veneer from 12" stock, rates of feed from 32 to 192 feet per minute, only three years old, in first class condition.

1—AMERICAN FIG. 5859 No. 3 DOUBLE CUT-OFF SAW, capacity between saws 8" to 6' 9", 4" thick, 30" wide, equipped with two 16" saws and power adjustment to movable table; new machine.

1—AMERICAN FIG. 5610 No. 25 EDGING AND RIPPING SAW, complete with countershaft; new machine.

1—AMERICAN FIG. 541, No. 4 CIRCULAR RESAW, with 24" saw, in good working order.

1—AMERICAN FIG. 5701, No. 2 SELF-FEED CIRCULAR RIP SAW, capacity 25" wide, 6" thick, equipped with 14" saw and countershaft.

1—AMERICAN FIG. 604, HEAVY SWING SAW, right hand to hang from ceiling, equipped with 48" saw and shield; almost new
84 feet of ROLLER TABLE for use with above SWING SAW.

1—AMERICAN FIG. 616, No. 7½ COMBINATION SAW BENCH, with full set of gauges, without dado head; in first class condition.

1—AMERICAN FIG. 6390, No. 1 DOUBLE ARBOR UNIVERSAL SAW BENCH, with tilting table, full set of rip, cross-cut and mitre gauges, including one 16" rip saw and one 16" cut-off saw, countershaft; in A1 condition.

1—AMERICAN FIG. 6390, No. 1 DOUBLE ARBOR UNIVERSAL SAW BENCH, same as above.

1—AMERICAN FIG. 575, No. 2 HAND FEED RIP SAW, with countershaft.

1—AMERICAN FIG. 6312, CROSS-CUT SAW BENCH, movable saw operated by foot treadle, capacity 10½" x 2½", particularly adapted for cutting off crating stock; in A1 condition.

1—AMERICAN FIG. 824, 24" BUZZ PLANER, fitted with square cylinder, power feed attachment and countershaft; in A1 condition.

1—AMERICAN FIG. 937, No. 1 SINGLE SPINDLE SHAPER, with plain countershaft; in first class condition.

1—AMERICAN FIG. 1110, No. 6 DOUBLE DISC SANDER, 36" dia. discs; in first class condition.

1—AMERICAN FIG. 1126, No. 9 UNIVERSAL KNIFE GRINDER, capacity for knives 31" long, two sided knife bar, one side fitted with clamps for holding thin high speed knives, one side slotted and fitted with bolts for holding ordinary thick knives; in A1 condition.

1—AMERICAN FIG. 1127, No. 9 UNIVERSAL KNIFE GRINDER, same as above.

1—AMERICAN FIG. 1145, No. 2 DOUBLE END EMERY GRINDER, bench type, complete with countershaft; in A1 condition.

In addition to the machines listed above, we have a complete line of high grade new and used machinery for any and all purposes.

Everything in Wood Working and Metal Working Machinery

The Jenkins-Falls Veneer Jointing Machine

The only Veneer Jointer that will effectively joint buckled veneer.

Stock is held flat by patented clamping device while the carriage travels past cutter and returns automatically according to length of stock worked. Many Canadian manufacturers are buying this jointer. It will prove a cost-cutter in your veneer room.

The Jenkins Machine Company make a specialty of the following high grade woodworking machines:—

Double End Geared Tenoners (Light and Heavy Type)
Single End Tenoners
Double End Gear Driven Cut-Off Saws
Special Veneer and Panel Sizing Saws
Veneer Jointer
Chain Feed Rip and Jointing Saw
Automatic Feed Attachment for Hand Jointers
Automatic Multiple Mortising Machine—2, 4, 6, 8 or 10 Bits

Full particulars and illustrations of any of these machines gladly sent on request

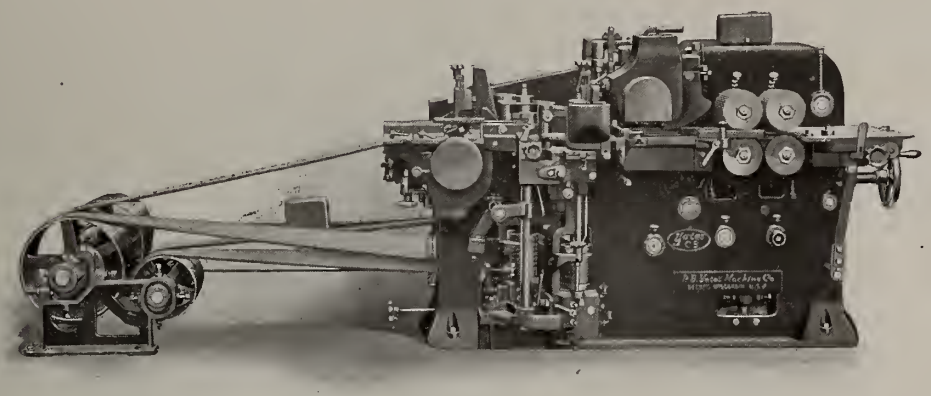
More Help!



The invariable choice of the man who knows

Type C-3 Moulder

combines strength, accessibility and speed to a remarkable degree. The capacity of this machine for handling the smaller mouldings is unequalled.

Feedworks have many unique features which add greatly to their strength. Entirely open side so that the utmost accessibility is secured. Reversible steel plate on working bed gives four ground surfaces and many times the wear of the ordinary bed. It is the last word in moulders.

Send for free, detailed, illustrated circular.

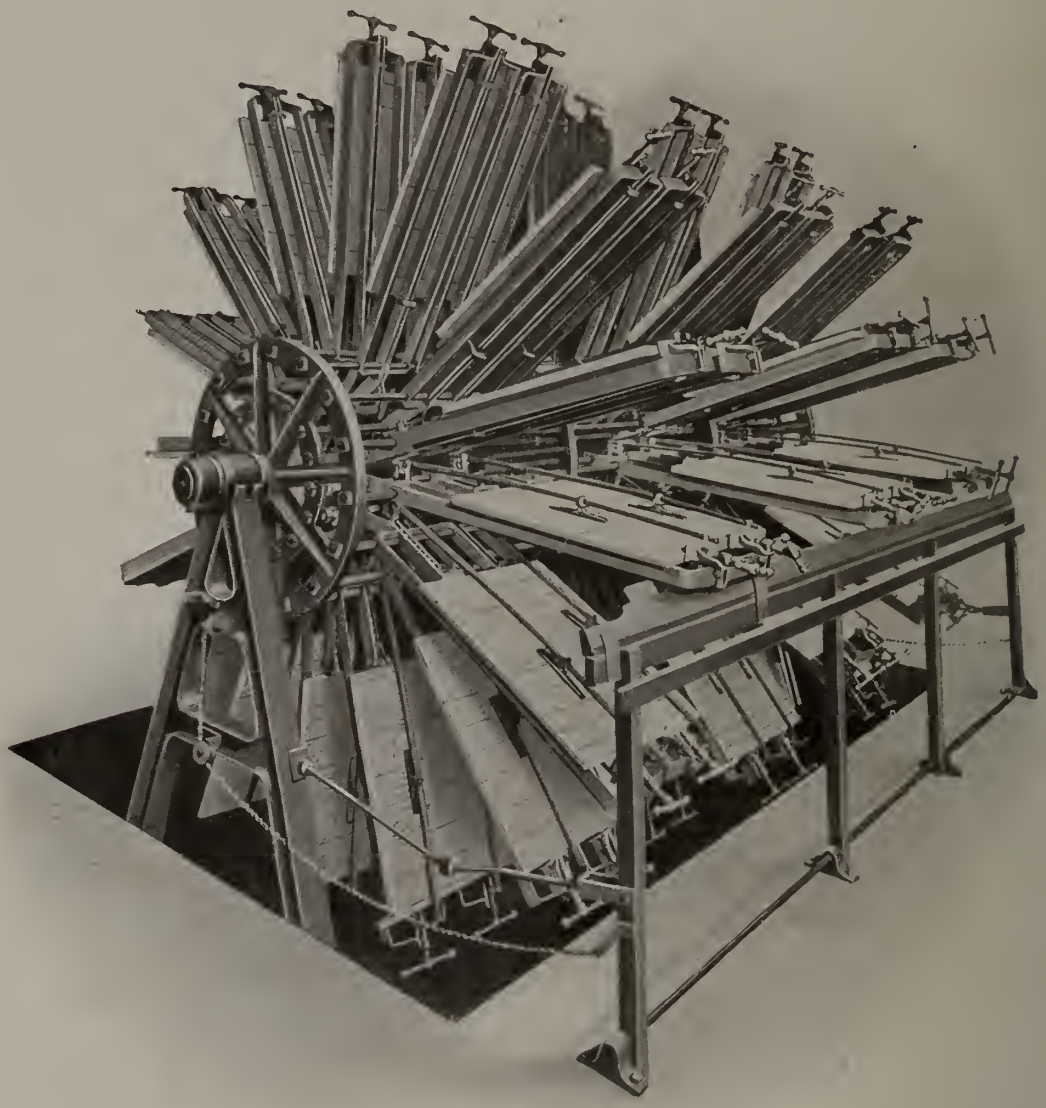
The

No. 200 Perpetual Revolving Clamp

for Simplicity of Operation



Wonderfully simple in operation is the No. 200 Perpetual Revolving Clamp. Its efficiency marks its use as practically indispensable for increased output of the better kind of work. For chair seats, furniture, dimension stock, school desks, refrigerator ends, special shapes, etc., it is without equal. It takes in 2½" in thickness up to 40" wide and 14' long. Many features of this machine will interest and please you. Write us for further particulars regarding this and many other machines that will assist for greater output.

Jackson, Cochrane & Company

KITCHENER - CANADA

The "Shimer Limited" Expansion Head

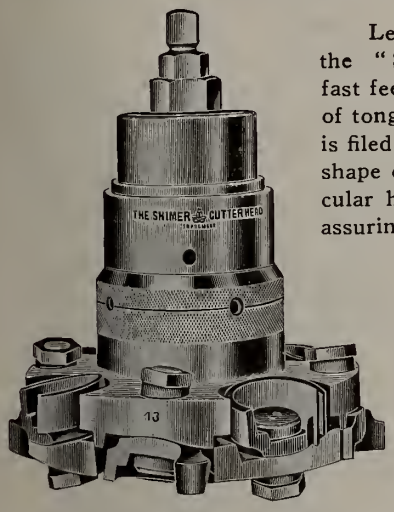


Fig. 627

Let us draw your attention to the advantages of using the "SHIMER CUTTER HEAD" for general Mill and fast feed Planer work. The Cutter is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The bit being circular has from 3½ in. to 5 in. cutting length to the cutter, assuring long wearing life to the cutters.

Note that the cutter, being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without the Self-Centering Sleeve, and made Expansion or Solid, to suit the customer's wishes.

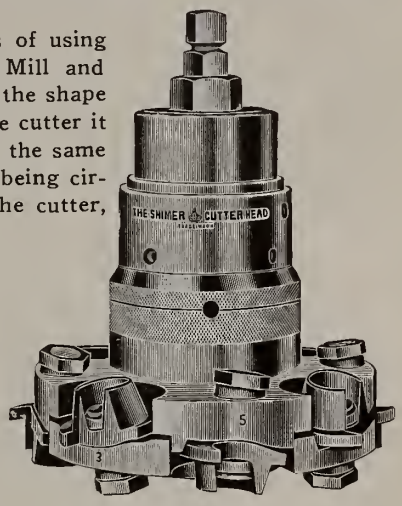

Fig. 268

Shimer Heads have been in use for sixty years, and their reliability and reputation have spoken for them in the past. Let us know your wants and we will guarantee their reliability at the present.

W. S. HAWKER.

Inventor and Designer of the World's most efficient Tubular Turning Machinery

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

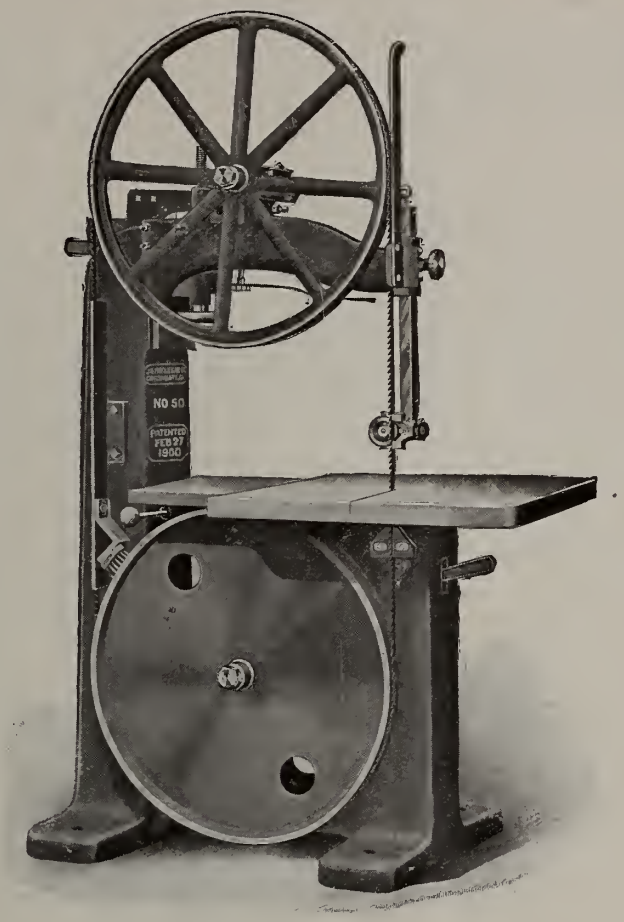
COWAN & COMPANY OF GALT, LIMITED, Galt, Canada



Save 25% to 50% of Blade Upkeep and Power Cost

Get Two, Even Three Times As Much Work

It's not the blades that wear out that cost, it's those that break.

It's the broken blades that cut down productive time and cost to repair and to replace.

Blade breakage is reduced to a minimum on Fay-Egan No. 50—36" **Square Column "Lightning Line" Band Scroll Saws.**

The Fay-Egan "Knife Edge" Blade Tension, made on the principle of a fine laboratory balance scale, is so sensitive that it compensates for changes in atmospheric conditions—yet, so flexible, you can pass a block between blade and wheel, while running, without breaking the blade. Folks tell us blade expense on "No. 50" averages 50 to 75 per cent. less than on the old timers.

The solid lower wheel acts like the fly wheel on your engine, its momentum carrying the load, so that the power consumption is reduced fully one-half, while at the same time it controls the light-spoked upper one, preventing over-running and choking down on a heavy cut.

The heavy square column eliminates vibration and permits the wheels to be revolved at 50 to 100 per cent higher speed, increasing the cutting capacity to double, and in some cases, triple that of the ordinary band saw.

As a user of saws, you cannot afford to ignore what Fay-Egan Square Column Band Saws are doing for others and can do for you. An investigation does not obligate you.

What Does SKF Mean?

To say that SKF denotes a standard of quality in a ball bearing is to recount that which has been proven and obvious for years.

To even say that SKF is a mark denoting a kind of bearing is to omit its more important significance.

For years this SKF mark has been the device of a business, pioneering in all fields of industry, championing the application of the ball bearing to mechanical design.

So that to the extent that it has overcome precedent in machine design, or upset traditions in bearing practice, SKF means more than a kind or type of bearing; it is a brand of service—working in the cause of better machine practice.

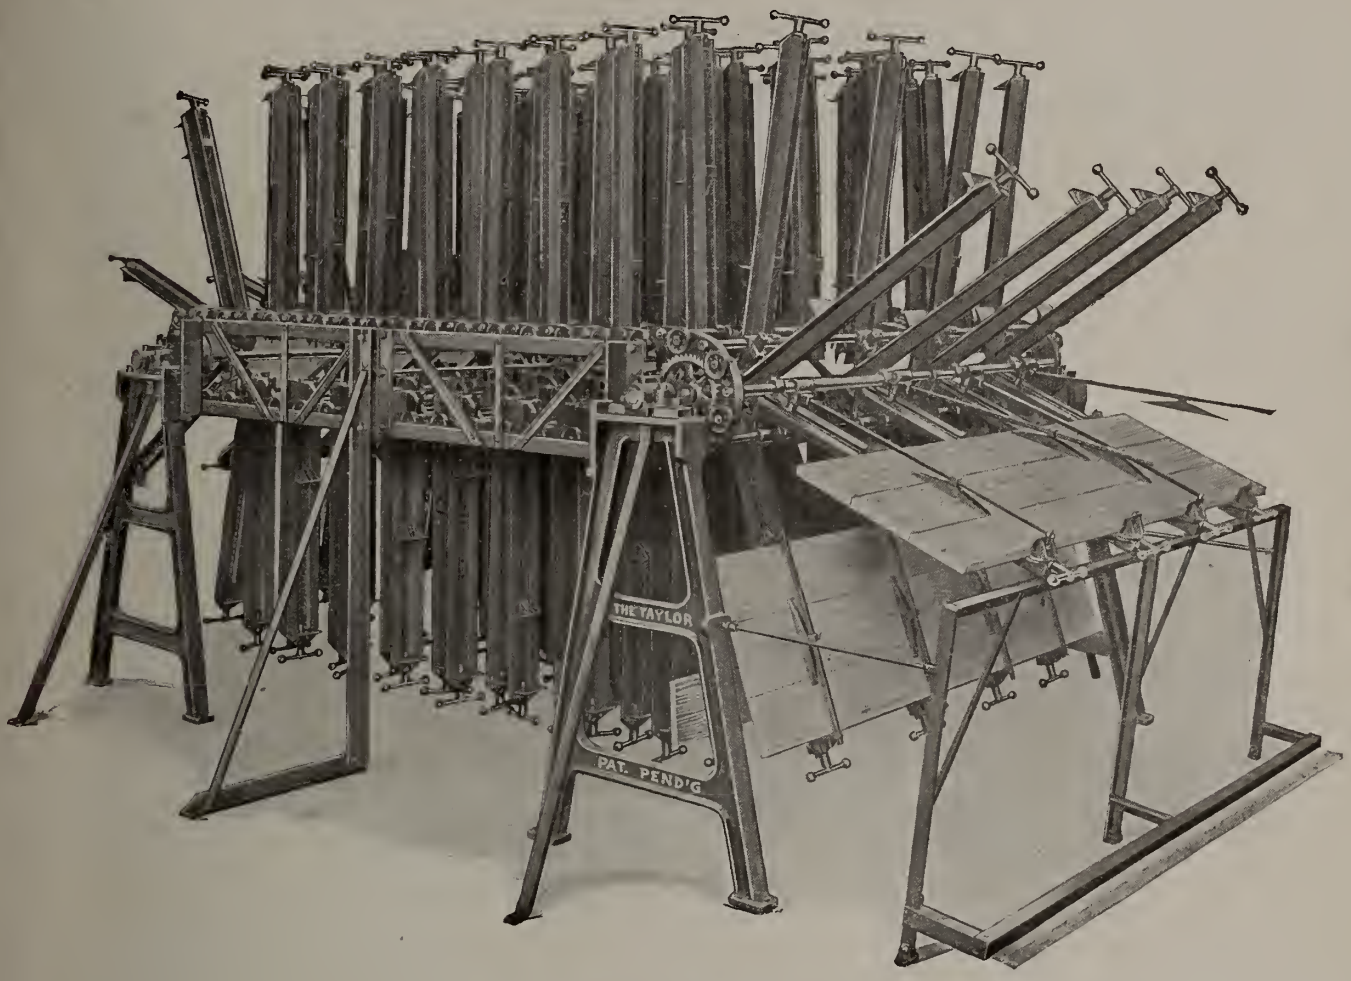
CLAMP The Taylor CARRIER

REG. U.S. PAT. OFF. TRADE MARK



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

OUR MOTTO

REASONABLE PRICES—that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

"AMERICA'S FINEST CABINET WOOD"

RED GUM

furniture "has come into its own at last." Whereas a few short years ago the alert furniture manufacturer (and dealer), with a finger on the public pulse, showed RED GUM only when it was insisted upon, and then with a half-apologetic manner, HE NOW SAYS: "COME RIGHT UP HERE IN FRONT —I WANT TO SHOW YOU MY RED GUM LINES." (Proud of it—and well he may be.)

WHY DON'T **YOU**, MR. FURNITURE MAKER, GET YOUR **RED GUM** LINE INTO THE SPOTLIGHT OF POPULAR FAVOR?

There's a lot of honorable profit in meeting public taste. Do you realize what our advertising to the general public (the real market) is doing for manufacturers who feature GUM? "Come on in—the selling's fine" with "America's Finest Cabinet Wood."

WRITE US FOR SAMPLES, PARTICULARS AND GENERAL INFORMATION. OUR REPLY WILL BE PROMPT, PERSONAL AND DEPENDABLE.

ADDRESS: RED GUM DIVISION.

HERE AGAIN

is the proof that we are not only PULLING FOR GOOD OLD

OAK

but also pulling *for those who SELL IT*—

THIS MEANS *YOU.*

Month by month we shall prove to the CONSUMER (*Your Customer*) that *OAK FURNITURE*—is due for a very heavy "COME-BACK."

Does your line meet the issue? If not, it can by next season.

ANOTHER OAK FURNITURE ADV. APPEARING IN THE BEST MAGAZINES IN AMERICA.

"Good OAK FURNITURE is more nearly 'boy-proof' than any other equally fine cabinet wood"

Its elegance, dignity and artistic adaptability are backed by its sturdy resistance to dents and scratches. (Really a quite important point.)

"There is no finer heirloom than good OAK furniture." There is no more *safe* and *enduring* investment—none better worth *insisting* upon.

IOWA WALNUT

The War Brought It Out

The absolute insistence of our Government upon American Black Walnut for gunstocks (and for aeroplane propellors to the limit of our capacity) developed the fact that the amount of American Walnut still available is more than ample for our domestic uses of several generations to come!

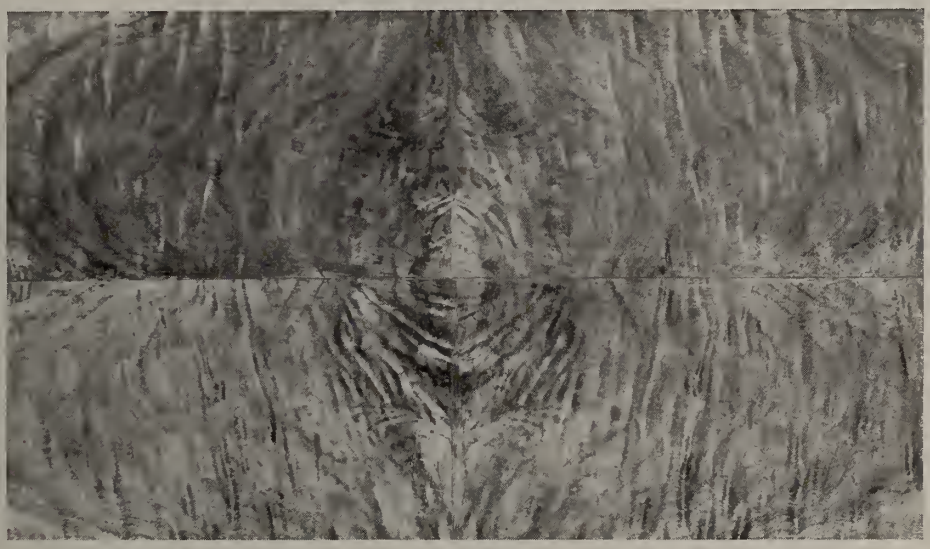
Its qualities are so incomparable among all hardwoods that it is no wonder that Walnut is classed as the supreme cabinet wood of the world. If you inspect the palaces and museums of Europe and America you will get quite an awakening—and you will then be glad that Walnut is still plentiful and that you can secure your supply—and at most reasonable prices.

Send us a list of your needs.

Des Moines Sawmill Co.
DES MOINES, IOWA

"Hartzell" Lumber and Veneers "Hartzell"

American Walnut Exclusively



"Hartzell's Choice Walnut"

Furniture manufacturers will do well to note that we produce only American Walnut, and therefore can be classed as the logical source of supply in this wood, and our years of experience in handling American Walnut will prove valuable to you if you desire to take advantage of it.

By saying that our long experience will prove advantageous to you we mean that you should by all means take time to examine our line before purchasing, because the quality will be far superior to the average line and the price no greater.

We study your particular interests and produce veneer of the kind and quality that is best adapted to your work, and whatever class of figure you are using we can give you a complete uniform line of just the wood you want for your selection, and it will not be necessary for you to handle a great lot of all sorts of samples and then find only a few stocks suitable for your needs.

When you purchase our line you can rest assured that you can duplicate your purchase just as near as it is possible to do so in Veneers, that is our part in serving you and we see to it that you are served right.

"SEND YOUR INQUIRIES FOR VENEERS TO US."

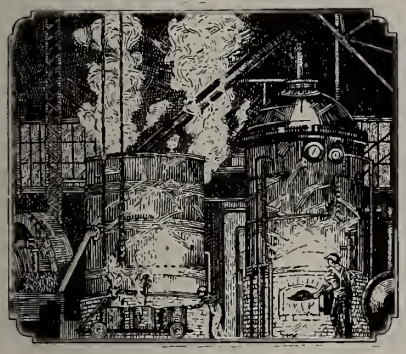
Wood Turpentine

(MADE IN CANADA)



THE Canadian Wood Turpentine—made at our mills at La Tuque, P.Q., is an excellent diluent and solvent and contains no free rosin.

This Turpentine is made by an improved laboratory process from Canadian woods and its distinctive odor clearly indicates that it is a different product from that given by the older methods of distillation.

Further and complete information gladly sent upon request.

Wake-up, Mr. Furniture Man!
Walnut is Plentiful!

AMERICAN WALNUT
"The Cabinet-wood Superlative."

Like Mark Twain

Everyone has enjoyed Mr. Clemens' famous comment on his premature obituary notice—"These reports of my death are grossly exaggerated."

So it is with the very erroneous but somewhat prevalent notion that "there isn't any Walnut left in American forests."

It isn't true. (And happy news it is for those who always have loved and coveted this "cabinet-wood of the elect.")

There are enormous quantities of American Walnut trees still standing in their patient and supreme majesty—growing year by year and awaiting the moment when they shall come into the homes of their admirers, there to become the choicest heirlooms of the wisest Furniture buyers of two continents.

AMERICAN WALNUT
MANUFACTURERS' ASSOCIATION
Room 1019, 616 South Michigan Boul.—Chicago.

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running Continuously in most of the Best Publications in America. Above is an example.

There are still a few Furniture Houses in the Country.

who are giving some of their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. Let them ask us for THE FACTS! (See address above.)

A Fine Finish for a Fine Instrument

IN a Jamestown, N. Y., plant they make the cabinets for a celebrated phonograph.

It is the work of master craftsmen, turning out these sounding boxes, the throats, as it were, of the phonographs. The cabinets must have a beautiful, uniform, satin-like finish, so the workmen use

CARBORUNDUM BRAND GARNET CABINET PAPER

They find it will do about forty per cent more work.

They find that it is remarkably flexible—that it lends itself to curves and angles without cracking or splitting—that it lays level without curling under the hand on the flat work.

It cuts fast, it cuts clean, and it's uniform

On the drum sanders and on the belt machines they are also using Carborundum Brand Products and sanding results prove the wisdom of the choice.

Is Canada to be Sectionalized?

It has come to our attention that the Postal Department of the Dominion Government is contemplating an increase in postal rates on Canadian business and technical newspapers. The new rate is zonal, i.e., it varies with the distance from the point of publication, and so great is the increase suggested that it would place a prohibitory tax on anything beyond purely local distribution, thus, in effect, dividing the Dominion into sections between which there would be no means of circulating news and information. This would affect us, as Canadians, in many ways. For example, it would, of course, make it quite impossible for Canadian publishers of a national character to exist, and would result in the circulation of foreign publications in Canada, with a consequent increase in the sale of foreign goods, and a corresponding decrease in the demand for "Made in Canada" products.

Another evident example is the influence such a move would have on our immigrant population. Difficult as it now is to assimilate him, this difficulty would be many times greater in the absence of national literature. All our past hopes and ideals of a Canadian "nation" would go for nought. We would become merely an aggregation of groups.

For the Canadian publisher himself, it can be said that he has received little encouragement and no protection in the past. All his raw materials are subject to heavy duty, in spite of which he has been forced to compete with foreign publications entering Canada duty free. In spite of this handicap our publishing houses are to-day covering the country from coast to coast, supporting our industries, urging the conservation of our national resources and the building up of an export trade—in a word, seeking to co-ordinate the various elements in this rich and rapidly developing country, so that we may become an appreciable factor in world history. Is it fair, or wise, to destroy this influence for good which has been built up at so great expense of capital and human energy?

Handling Stock to Advantage

The economical handling of lumber and partially manufactured stock has been given more consideration of late years than ever before. One reads of factory transportation systems, overhead carrier systems, elevating trucks and even whole lumber yards on wheels.

In this connection many factory owners are installing conveyor belts or chains to assist in the economical movement of work through the plant. A belt placed behind a certain piece of equipment will carry the stock to the next machine, eliminating all intermediate handling and will often place the work so convenient to the operator of the second machine that it will tend to increase production from that machine.

Where a conveyor, either belt or chain elevating, is feeding a machine it is advisable to train the men handling the stock to feed the belt at a rate that corresponds to the capacity of the machine. They can be taught, with a little instruction, to do this. Thus if lumber to be dressed in transit, or for ordinary manufacturing purposes, is being conveyed to a machine that is carrying a feed of one hundred and seventy-five feet a minute, the men would be instructed to place the material on the conveyor at a corresponding rate. This would give the machine operator a chance to handle the material to the best advantage as well as maintain maximum production.

Some form of conveyor systems could be used advantageously in practically every woodworking plant. After once installed it is capable of doing an enormous amount of work with a minimum of upkeep and expense.

Standardize Building Material

Nearly every municipality on this continent is claiming a shortage of workmen's houses. This branch of the building industry is one that requires the best possible results with the least expense, and in order to attain this object there is room for improvements on the before-war- conditions.

If the houses for the working men were confined to, say, five styles, and those styles were standardized in regards to specifications, it would assist the contractor to speed up construction and also the supply man to assemble doors and frames, window frames and sash during any time that the factory was not crowded with orders. If the different contractors would use cost sheets of their labor, waste, and overhead expenses, in other words, organize a campaign of education as regards equipment, transportation, cost of work, etc., that would prevent waste and must surely cheapen construction.

Shall We Divide Canada?

IN 1867 our fathers consummated at great price a union of all the provinces and interests of Canada. For over half a century the provinces of Canada have developed together, each the component of the other.

Canada must be bound together as it is to-day, not so much by the machinery of government as by ideas held in common by all and freely exchanged, so that all sections sympathize with each other. This result has been accomplished primarily by the press, particularly the weekly and monthly periodicals and business papers.

They have no local or sectional bias.They go to all parts of the Dominion. They serve all parts alike. Their service is in bringing all provinces close together into one great nation through one common understanding.

Canada must not be split into half a dozen sections—weak with the evils of sectionalism, disastrous in the extreme—overflowing with narrow provincialism.

Emanating from we know not whither, comes an idea that will rip asunder all the good done in over half a century of patient building.

It is proposed to tax the very thing that has bound Canada into one—to place on the nation-binding press a zone postal tax which would increase the postal charge upon national periodicals as high as 800 per cent. It means loss to you personally and a loss to your country. It will weaken, cripple and in some cases destroy Canadian national periodicals. You will be deprived of papers that have kept you informed on your country's problems, your business problems—that have helped you in your work. Such magazines as do survive will cost you much more.

The publishers are not trying to evade fair taxation. They will gladly accept any fair tax upon their profits.

But is it fair that you should be taxed out of getting journals, papers and magazines that have helped you build your business and in turn built the business of the country?

If you believe in national ideals and national periodicals, sign attached form.

Tear off and mail to-day

CANADIAN WOODWORKER,
345 Adelaide Street West, Toronto, Ont.

I am opposed to any zone postal law which would mean charging higher subscription rates to subscribers, according to distance from office of publication.

Well planned four and six room houses

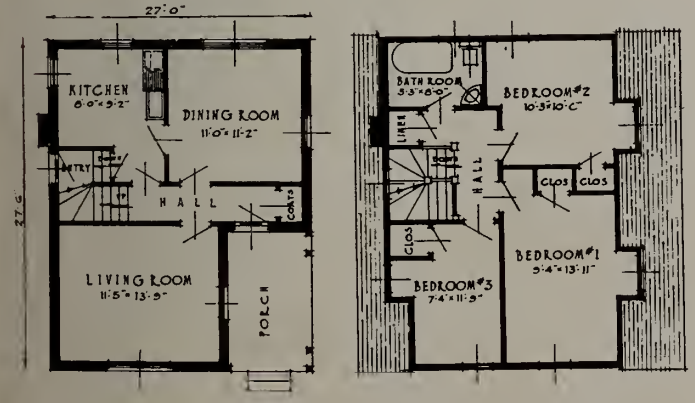
Cosy Homes at Reasonable Cost

The residences being erected by the different housing commissions contain many features that could well be embodied in the majority of private homes. The arrangement and size of rooms, the elimination of waste space and little used or extra rooms and other similar details are the result of years of investigation and study.

The accompanying sketches illustrate the type of houses designed by William Lyon Somerville, Toronto, for the Trenton Housing Commission. Many housing schemes are spoiled by erecting residences that are very similar in design. True the houses may not be exactly alike but the variation is in detail only and is not marked enough to detract from the monotony of a row of houses of the same general style. The staggering of the buildings helps some and is a very desirable idea to follow but in itself is not sufficient to overcome the sameness of construction.

In this scheme the contrast is more marked and consequently more pleasing. The cosy cottage between the more pretentious dwellings cannot help but lend variety and add to the attractiveness of the whole scheme.

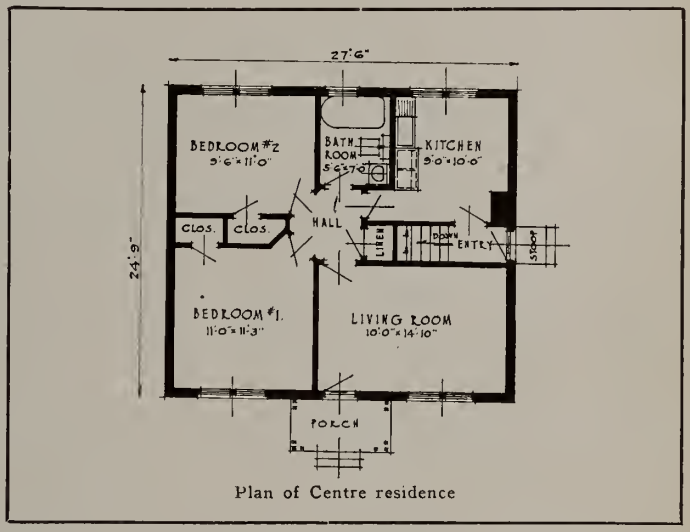
A study of the floor plans will reveal the fact that the hall space has been kept as small as permissible. This is in keeping with the idea of doing away with



Layout of larger house

all waste space. There is just sufficient room to provide access to the different parts of the house. Closet space is provided where needed and every attention given to detail so as to, as far as possible, provide a convenient layout and lessen the work necessary to the upkeep of the home.

The idea of making the rooms of odd sizes is to enable stock lengths of joists and rafters to be used without cutting. This lowers construction costs, for less labor is required to frame the house and a certain amount of waste is done away with. A room 9 ft.



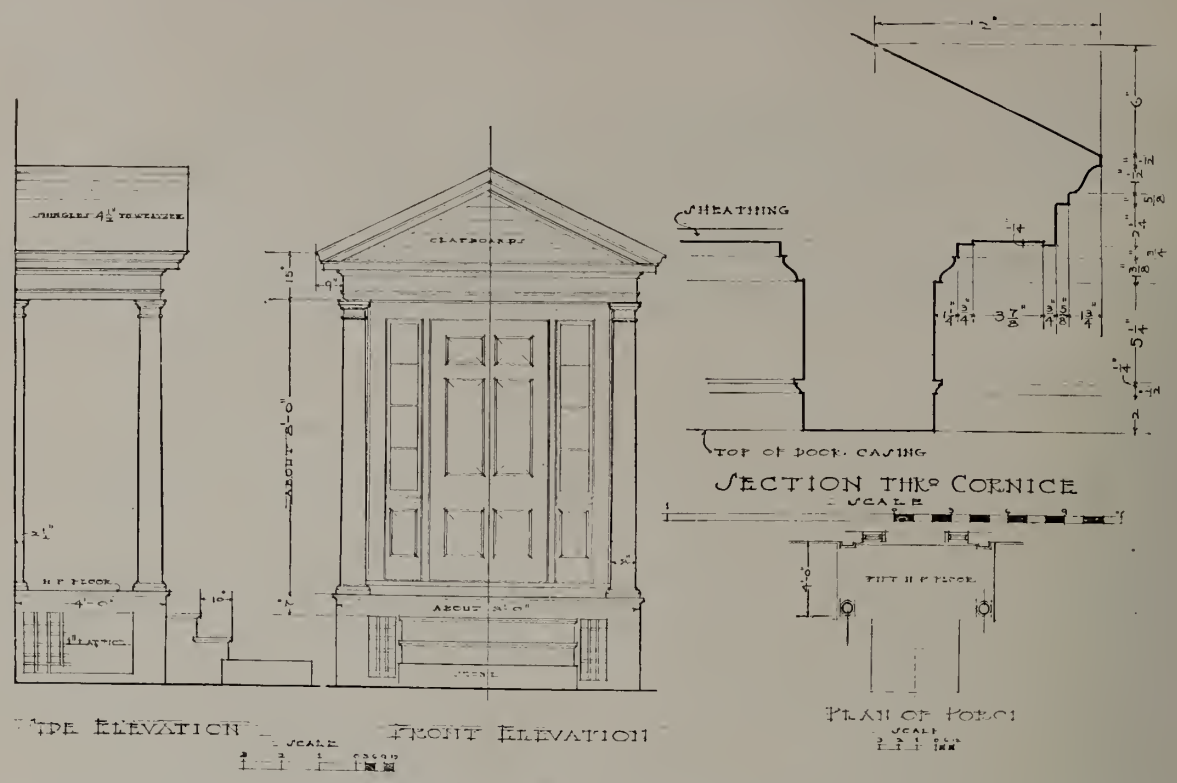
Plan of Centre residence

6 in. will require 10 foot joists while if it were made 10 ft. wide 12 foot joists would have to be cut to suit.

One suggestion would be a cheery fire place in the living room. As these houses were designed to be built for a very reasonable figure it was probably found that the amount allowed would not cover such a desirable item.

New Furniture Woods Brought to Light

As a result of the work of British investigators who have been studying the timber resources of the Malay Peninsula several woods not previously used for commercial purposes have been brought to the attention of the public. Among these, says Eastern Engineering, was the wood of the serays (Shorea curtisii), which seems suitable for use in the construction of furniture and of railway wagons and coaches; the wood of a tree locally known as belain, that is apparently of excellent quality, and four species of emranti, which are being experimented with for railway sleepers. Other woods there are suitable for making canes and matches.



Details of pleasing Colonial entrance

The Choosing of Doors and Entrance

Appearance Expresses Individuality of Owner—Should Conform with General Style of House—Attractive Designs for Doors—Vestibule Given Attention

By W. H. Shaw

Many people do not realize how large a part the entrance to a house plays in determining its character The doorway reflects the spirit of the owner, since his dominant traits characterize not only the type of house he builds, but the details and the whole atmosphere of the structure. To choose a doorway design arbitrarily, without adopting it to the house, is not the right way.

So many people make the mistake of deciding upon their details quite independently of the general architecture of the house they intend building. Of course, if the doorway seems to them more important than the house, they can choose their doorways first and then build a house to suit it. A far better plan is to choose the type of house first, and after that is done, pick out the details in the order of their importance.

Choosing Appropriate Entrance

One of the most difficult things is to decide on an attractive and appropriate entrance for a house which does not possess one. It is a problem which finds its way very frequently to the drafting board of the contractor and the millwork supply man.

The design of the entrance should be distinctly in the adopted style of the house. A beautiful design for a colonial house is the so-called Venetian type, 49 on the accompanying illustration.

It gives a cheerful aspect to a house, has a broad open-faced welcome, and admits an abundance of light to the hall. The lights can be leaded or divided with wooden sash bars into a number of different designs in lieu of those illustrated.

If more simplicity be desired, a design can be used for the transom light similar to 43, and the sidelights can be the same as 45. This design, altered as suggested, would match well with a Palladin window placed on the stairway at the opposite end of the hall. Much that has been said can be applied to design No. 44, except that it would go better with a window of simplier design.

Let me emphasize this point of keeping all things in harmony. If the style adopted can be carried out in the furnishings of the house, so much the better, but at least keep the house itself exclusively in one style.

Entablature Type of Doorway

The door shown as 43 is a century-old Deerfield, belonging to the class known as entablature doorways. These look especially well for a side-drive entrance or a front entrance where the porch is very high or where there is not any porch, the door opening directly on the street. The door knocker shown is not of much practical use in this day of modern eletcrical equipment, but it serves to bring up memories of the past and is often a very pretty ornament. To be too utilitarian or conventional often takes from the home the sentimental qualities that tend to make it inviting and homelike. These are most desirable features in a home.

The door numbered 50 is very attractive, while number 51 would make a neat cottage door. if in keep-

ing with the windows, divided likewise into diamond lights. Design 48 would make a very attractive doorway for a side porch, opening into the garden, or, better still, between a room and the conservatory.

The style indicated at 42 would make an attractive entrance to a small suburban cottage having no front porch. The columns should set out from the house from two to six feet. If not out more than three feet, it would look well to put a lattice, similar to that in the pediment, up the sides between the columns and wall, these to grow vines on.

A pretty side or rear doorway that was a favorite with our grandparents, is made by placing a vertical lattice about thirty inches wide extending outwards on each side of the door and across the top; overgrowing the whole with old-fashioned roses, or other climbers, transforming by nature's aid a mere hole in the wall into a beautiful entrance with the added fragrance of an effusion of flowers.

Dimension of Front Entrance

You cannot limit the exact dimensions of a front entrance, depending, as it does, upon so many conditions. Its proportions, therefore, can only be spoken of in a general way. It must not be narrow or of a stingy appearance for that would be the first impression one would then receive of the owner of the house. It should rather be broad and generous in its aspect, even to a fault.

Over the front entrance there should always be some kind of shelter to protect one while awaiting the opening of the door. This of itself expresses congeniality. Make that shelter or porch appear for utility rather than a means for expressing one's fastidiousness by excessive ornament, bearing in mind the charm of simple beauty.

Suggestions for Treatment

The home builder who can not or does not desire to go to too much expense for his entrance can find many good suggestions in designs 30 to 35, designs 30, 32 and 34 being particularly commended for their simple beauty and dignity. Doors 30, 31 and 42 can have either glass or wood panels, as desired. If there are no sidelights or windows in the hall it is best to admit light through the door in some one of the many ways shown.

The lights can be made of crystalline or other obscure glass if desired; but for the sake of looks it is best to use clear, plain or bevel plate for door lights, with plate (preferred) or double-strength glass for the transom and side lights.

Finish Alike on Both Sides

If the outside trim of your house is painted and the inside finished in natural woods, make the door of natural wood finish on both sides, the outside panes, sash and casing of the entrance like the trim, but the inside casings, etc., the same as the door and other inside finish. Never "mix" on the door, making the inside of one color or wood and the outside another, as it cheapens it in appearance.

After having studied the front door problem and having arrived at a conclusion of what is desired, due attention must be given to the interior doors, that they may conform in design and be in harmony with the entrance door. For example, if design 34 is used for the entrance, design 41 should be used for the interior, or if design 50 or 57 are used for the entrance door, design 36 or 38 should be used for interior doors. If one desires to copy our public buildings they can use design 40, as this is the design used in both the parliament buildings at Ottawa and Toronto.

Suitable for China Closets

A good china closet door can be made by using style number 46 and placing shelves as indicated by the dotted lines. One gets a glimpse of the dainty ware on four shelves. Below the shelves behind the door, build in drawers for table linen, utensils, etc.

For sliding doors use door hangers that are held on the track and cannot jump off. Use three strong hinges in outside doors and two hinges for interior doors. Have your hardware in harmony with the finish and design of entrance and other doors and windows.

Designs for exterior and interior doors

Veneered doors are better than solid doors if made right. A better grain of wood can be obtained. Make side and top styles to panel doors five inches, bottom rail the height of baseboard; muntins between panels not less than three and a half inches.

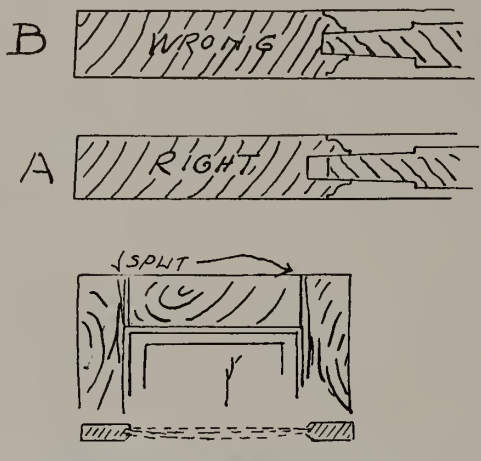
Thickness of Different Doors

In wide doors having considerable glass, top and side styles should be six inches for strength. Thickness of veneered doors one and three-quarters and two and a quarter inches. Solid doors are made inch and three-quarters and inch and three-eighths thick.

In the average house, the best width for front doors is three feet to three feet six inches; for interior doors, two feet six inches to three feet. Keep casings at top of doors on a line with top window casings. Usual height for interior doors is six feet two inches and six feet eight inches, but can vary. All doors on one floor, however, should be made the same height. Bedroom and closet doors are sometimes six feet six inches high. Height of entrance doors varies with

the design, but it is best when possible to make them the same height as the interior doors.

The front door of a very fine house is shown on the working drawing "A," allowing a space of half an inch in the style for the "come and go" of the mill oak panel. This particular door had been constructed originally as shown at "B". The panel expanded with the result indicated. This condition lasted for some time, when the oak styles, no longer able to stand the



Details of door, showing faulty construction

strain, let go with a crack like a pistol, the side styles separating from the top and bottom one, the door was a wreck and had to be made over.

Don't Overlook Vestibule

The vestibule is necessarily a part of the entrance. As its size, shape and location depend entirely upon the arrangement of the plan, a few remarks will suffice. The usual form is a rectangular box, a little wider than the entrance, but it is best to make it more of an ornament or of some use other than a mere place to pass through—and afford double doors to the weather. A small entrance vestibule is an eternal nuisance. A vestibule should be at least large enough to accommodate both the guest and the hostess at the same time.

A splendid arrangement is shown at "C," the interior entrance being a repeat of the exterior, while on both sides of the vestibule are coat closets, one each for ladies and gentlemen. The doors of these closets should have a mirror panel of two-thirds or all of the length. Do not project a square box vestibule out on the porch. It suggests a cramped condition of the plan within, being, as it is, fairly crowded out. Plan D. is a pretty and unique idea and would in no way trangress the above rule, being nearly a bay.

At E is shown a good substitute for a vestibule. Make the partition here twelve inches thick to prevent a hitting of the knobs. Make the outside storm door a counterpart of the permanent one, and replace it in summer with a screen door.

Speeding Up Production

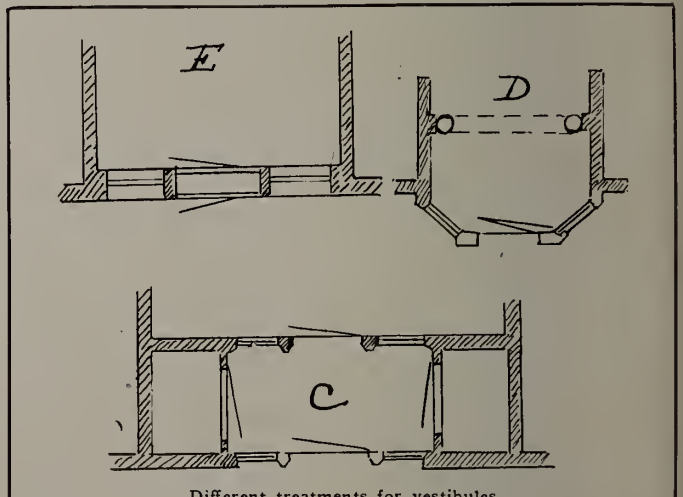
The March issue of the "Canadian Woodworker" contained an interesting and practical article on the application of the bonus system for increasing production and satisfying, to a greater or lesser degree, the demands and aspirations of the employees. The following item, taken from an American publication, shows that the above idea has been successfully adopted in certain factories and that it is believed that there are great possibilities in the bonus system as a panacea for most of the labor dfficulties with which industry is confronted:

"A new plan aimed to reduce industrial unrest and at the same time to secure greater output and efficiensy, has recently been adopted by a firm of machinery manufacturers in England, and the Higher Production Council, which has made public the details of the Priestman plan, as it is called, believes that it will solve many, if not all, of the labor difficulties now facing industry.

"The plan is based on the principle that a number of men can produce by ordinary effort a certain amount of work, which is considered the standard, but by increased individual effort this standard can be exceeded. Under the working of this plan every employee receives a percentage on his wages for all output in excess of the accepted standard. Therefore if the standard output is increased by 50 per cent. by an employee whose wage is, say, $12 a week, he would receive $18, the $6 over his normal wages representing the amount earned by him for exceeding the standard output.

"Under this arrangement, it is claimed, all friction caused by the usual piece-work system is avoided, and a maximum output is obtained because all concerned benefit by it."

This plan rewards any or many workmen for additional output. In a factory unionized it seems to us it would not operate satisfactorily, though it might serve as a temporary expedient. The union's policy is to subordinate the individual, and place all labor on a common wage-earning level.



Different treatments for vestibules

With either closed or open shop, would it not be better to fix a standard for the whole plant, and give the entire working force extra pay for additional production ?

Objection might be advanced that some of the men "soldier" on their jobs, and would get more than they deserve; but it is human nature in such circumstances for the industrious to get behind the laggards, and speed them up.

Anyway it is immaterial to the manufacturers whom he has to pay for greater production just so he obtains it.

Building Bigger Market for Furniture

Furniture Manufacturers Have Unique Opportunity—Co-operation of Retailers and Patriotic Bodies—Competition to Arouse Interest in Rural Centres —Organize on Large Scale for Extended Campaign

By G. W. Gibbard*

Any nation whose citizens are home lovers is bound to be prosperous, as the population would be contented and happy. We as members of the Furniture Manufacturers' Association have a unique opportunity to help solve the problem in both rural and urban centres, by educating the people of Canada to the importance of having comfortable and well furnished homes. An attractive house cannot help but be an influence and help solve the rural problem which is so much talked of to-day.

G. W. Gibbard, Gibbard Furniture Co., Ltd., Napanee, Ont.

At the same time we have an opportunity to do ourselves a good turn. When we realize that the annual per capita expenditure of Canadians for furniture is less than $1.50, or approximately $7.50 per family, we can realize that a great field for cultivation is available. This applies more particularly to the smaller towns and rural districts. Young people are more certain to be kept on the farms if home conditions are attractive. In this respect there is room for great improvement in Canada. To accomplish this we must follow the fundamental law of selling. Get all the people thinking about the same thing at the same time.

Start while Business is Good

There are several ways to create a much larger market for furniture in the rural districts of Canada and in the smaller towns. If we manufacturers will study this problem and map out a program of a comprehensive character. While it is true that this means the spending of a considerable sum of money, when the amount necessary for an advertising campaign is based on the output of our factories, the assessment per thousand dollars would be a mere trifle, and I think would assure the industry of a steady demand which would keep our factories busy, even should there be the period of depression such as many people predict will come next year.

I would suggest that our Association proceed at once to organize for a campaign to be started in September. If we do this, benefits should begin to show themselves by the spring of 1921, and results would become greater and greater as the campaign continued. It would be unwise to delay our plans until there is a real slackening of business. The creating of a new market cannot be accomplished quickly. We must work at least a year ahead and we should frame a policy extending over at least three years. If we do this we will undoubtedly achieve results that will repay the investment over and over again.

In order to appeal to the imagination of the people of the rural districts of Canada, I would suggest offering a comprehensive list of prizes for essays or articles on subjects that would stimulate interest in house furnishing. I suggest subjects like the following: Influence of a Well-furnished House on Keeping the Family at Home; How a Farm Ought to be Furnished; The Relation of Well-furnished Homes to the Community.

By advertising in farm magazines and local papers reaching farmers, the competition can be brought to the attention of the public in all the rural districts of Canada. But I would not advise confining advertising to the boosting of the competition alone. From the very first we would make the advertisements of such a character that they would stimulate interest in home furnishing. By means of the competition, which should probably spread over a period of three or four months, a lot of interesting matter would be gathered together, and new material for advertising will no doubt be received. The advertising campaign should be made continuous throughout the fall and winter. It might dwindle to smaller proportions after the opening of spring and either drop or run on a very small scale throughout the summer. Then it should be taken up again in the fall on fresh lines for the second year.

Organize on Large Scale

The propaganda should not be confined to newspaper advertising. As many forces as possible should be brought into sympathy with the movement from a patriotic standpoint. The co-operation of the Woman's Institutes should be enlisted if possible, and articles on home furnishing should be prepared to be read all over the country at meetings of Women's Institutes. The patriotic appeal should be used. The importance of the campaign might also be brought to the notice of the rural school teachers whose sympathy in the movement for better furnished homes would be very helpful. If the movement is properly handled a great deal of very interesting editorial matter can be secured, free of charge, in many rural newspapers as well as in the farm magazines and similar publications.

One of the first moves should be to stir up furniture dealers in the smaller centres of Canada to the importance of what we are attempting to accomplish. Every local furniture dealer should be stimulated to boost the campaign in his local advertising. A suitable propaganda for stirring up the interest of dealers should be organized. If handled aggressively the whole campaign, comprising many different forces working in unison, should attract very wide attention.

*Address before Furniture Manufacturers' Association.

There is no question but that advertising can be used by our Association in such a way as to increase the demand for furniture in the Canadian rural districts. We have many examples of great industries that have been built up by the power of publicity. The automobile industry, for instance, has been developed by the heavy advertising carried on by so many strong companies. Advertising has made the phonograph industry. These are examples from many that might be mentioned. Everyone wants to do the popular thing and, if you can focus attention on the better furnishing of homes, we are bound to reap rich results. The secret behind many of the successful patriotic campaigns that have been carried on within the past few years has been the fact that means were taken to get all the people thinking about the same thing at the same time.

A recent example of success by following this fundamental law is the Forward Movement of the churches. They used newspaper and magazine advertisign, as well as other forms of publicity. I had the privilege of watching the results from a point of vantage in a large rural community. Many farmers, who were considered hard-shells and never gave away more than five dollars before in their lives, contributed one hundred dollars and without any persuasion, to the great surprise of the whole community. Moreover, our memories of 1914-15 should still be fresh enough in our minds to remind us how quickly good times can change to hard times. The experience of the piano manufacturers at that time is an example of what can be done in a rural community. They were slack for a short time, then adopted advertising to influence rural communities, and were very busy long before the furniture trade had recovered to normal.

Associations Who Believe in Publicity

Many examples can be quoted to show that the soundest method of creating a demand is by advertising. As one example out of many, we might take chewing gum, the annual sales of which now amount to over thirty millions of dollars. Gramophones are another example of what trade advertising will do.

I wrote to several associations as to the success they had had in their advertising, and the following associations have assured me that their advertising campaign has been successful and very profitable to them. American Face Brick Association, Southern Cypress Mfs. Association, Oak Floor Mfrs. Association, National Canners Association, Rite Grade Shingles, West Coast Lumbermen's Association, The Irish Linen Society, Save the Surface and You Save All, Paint, Varnish, Save the Surface Committee, Birch Mfrs. Association.

Western Plant Increased Production 100%

Bonus System Effective Aid—Finished Parts Storeroom Lessened Confusion —Accurate Recording System to Keep Track of Parts— Factory Organization Strengthened

By James J. Martindale*

The manufacture of phonograph cabinets was seriously delayed, due to the lack of veneered panels, in a factory where Luxembergers were mainly employed. These foreigners had mingled very little with English speaking people and accordingly many of them could not understand even the usual English expressions. This condition greatly hindered efforts to betterment.

As the investigation of methods and product got under way, the clannish sullenness of the employees became more evident. Their minds could not grasp the fact that their methods might be improved to their individual betterment.

Officials Showed Marked Indifference

The superintendent of this particular department, a very well educated and sociable American, was phlegmatic, indifferent and a brother-in-law of the owner. He was lacking in a sense of responsibility to the firm. However, observations were continuously carried forward under these obstacles and finally a chart was prepared which showed standard times covering all the various kinds of panels being made.

A report showing daily gang standing was posted and excited but little interest. Such a report generally arouses attention. It was evident more than the usual time must be given to make over the human element.

Consistently, tactful explanations and suggestions were made to the superintendent and foreman and at the end of the fifth week the men got into the bonus pay. From then on, the work assumed an easier aspect as the effect of the additional pay cheque became slowly apparent. The men realized pay by pay that the company was rewarding them for increased output.

Individual Responsibility Fostered

That most valuable spirit—individual responsibility—took root, was well nourished and the gang itself commenced to weed out the drones and replace them by ones more active and interested in the daily output. Most interesting of all was the complete reversal of the superintendent. This man now publicly proclaimed his strong adherence to the principles displayed, and his desire to push them.

A shoulder to shoulder spirit had displaced the sullen, apathetic attitude—the production increased over 100 per cent.—the value of output per year jumped from $135,000 to $335,000 in this department alone. The accompanying chart shows the increase.

The above "story" portrays in a somewhat general manner the introduction of production methods in one department of a Middle West plant. This plant was located in a small town of about 3000 inhabitants and was the largest industrial in the place. Probably a member of every family had at some time worked in the phonograph factory. The habits and methods of the employees were traditional. It was commonly called the chair factory as chairs had been the plant's output for 35 years until 1918 when the phonograph business was developed.

Details of Operations Worked Out

The foremen held their jobs due to the knowledge stored in their heads. If this knowledge had been

*Vice-president, James E. Morrison Co., Detroit, Mich., Industrial Engineers.

a matter of record, some of them would have been out long ago but the management was naturally reluctant to dispense with the services of any man who, due to his long experience and consequent command of essential information, could by his absence, seriously cripple a department.

Specifications and operation sheets covering all parts made by the company were developed. With this information in hand the life hold on his job by any foreman was seriously threatened and moreover, he knew it. This situation somewhat spurred on the majority of the executives, but in the case of one foreman who had charge of a primary department his attitude became more sullen and indifferent. He was let out. The effect on the rest of the executives was most beneficial. The organization commenced to realize its responsibilities.

Finished Parts to Storeroom

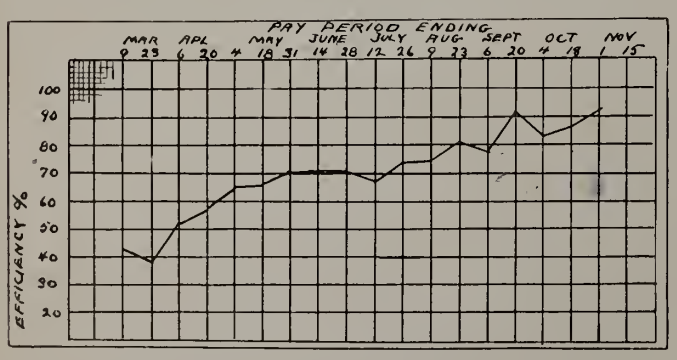
One of the serious handicaps to production in the main plant was the lack of a finished parts store room. The assembly floor was seriously impeded in its work due to the continual lack of parts and the consequent necessary switch to phonograph cases of a different construction. Work would be performed for a day or two on the second type of case until some part on it would be missing and the assembly gangs then changed back to case No. 1 or case No. 3. This condition was most discouraging to employees and the assembly foreman.

All truck loads of finished parts lying around the assembly floor, were moved into the stock room. This action gave the assembly men considerably more elbow room. They could arrange their individual activities to better advantage.

The primary departments were loaded with orders for parts and as fast as finished these parts were moved to stock and thence upon requisition, transferred to the assembly floor. Gradually a stock of parts for certain cabinets was built up. Finally a completed set of parts for case X was on hand and the assembly floor could be assured of a straight "drive up" for a week.

At that time the battle was won—production was under control.

Many other factors contributed to this control such as a "Part Order Progress Record," "Follow-up Report," "Job Ticket," "Stock Record," etc. The "Part Order Progress Record" and "Stock Record" are shown in accompanying illustration.



Indicating how efficiency increased

The Organization Biggest Asset

Carnegie didn't worry about a possible loss of his buildings and equipment—they could be easily purchased and set to producing if his organization was intact. He however, was most interested in his subordinates. His success was mainly due to the judgment and care he exercised in picking his executives and then rewarding their efforts.

An organization is the determining factor in the success or failure of any enterprize, therefore the big problem in all industrial betterment work is connected with the executive force of the client. This problem was rendered more difficult than usual in this case as there were but few opportunities for the executives to obtain the cosmopolitan touch of a large

city and consequently their habits had become set and hard to change.

It was necessary to devote considerable time and attention to conferences and impromptu talks in which the organization was brought to a better understanding of their duties and accountabilities. A production department was slowly and carefully built up. This department was coached in the betterment methods under way and future plans discussed and provisionally outlined. The work was terminated when the client's force was fully capable of carrying forward the principles implanted.

Combined Refrigerator and Kitchen Cabinet

A combination refrigerator and kitchen cabinet attracted considerable attention at the furniture exhibition in Grand Rapids recently. This cabinet, known as the Frigi-cabinet, consists of two parts, the lower section or base being fitted up as a side-icing refrigerator while the upper half is equipped with the usual kitchen cabinet fittings. It was shown in the usual woods and finishes.

The chambers in the refrigerator section contain ample storage room for meats, butter, milk and other perishable foods and the refrigerating qualities are such that these commodities will remain fresh for a considerable length of time.

The upper case is fitted with a flour bin, with sifter attached, a compartment for cake or bread, a large storage cupboard, and a bottom cupboard, with a roll front, containing the necessary glassware, sugar jar, measuring cup, etc.

The large number of ladies in attendance were very much taken with the idea of having their butter, eggs and milk in the same cabinet with flour and other baking materials as a saving in labor and steps would naturally result. So that in addition to the space saved by combining a refrigerator and kitchen cabinet the labor saving features of such an article should make a strong appeal to the housewife.

Accident Prevention as Dividend Producer

Furniture Manufacturers Assessed at Lower Rate Than Planing Mills—Woodworking Industry as a Whole Suffers by Comparison

By S. Price*

There has now been five years' experience of the present Ontario Workmen's Compensation Act. Since it came into operation laws similar in principle have been adopted in nearly all the other provinces of Canada. The outstanding features of the Act are the simplicity of its provisions and procedure, the extension of the benefits to all injured by accident arising out of and in the course of employment, the elimination of litigation and expense, and the expeditious payment of benefits directly into the hand of the injured workman or his dependents.

Comparing Compensation Laws

It is a collective liability law, as distinguished from the direct individual liability law of Great Britain, and from what may be called the private company insurance individual liability law prevailing in most of the United States, though the conditions upon which payment of compensation depends are now, in all the places mentioned, much the same. In England the law is said to be only about 50 per cent. effective, because of the litigation and law costs involved and the financial insufficiency of many of the employers, while in the United States, as revealed in a recent investigation and report made in the State of New York, the settlements which the insurance companies are permitted to make with the beneficiaries have been found to be far short of what the latter were entitled to, though the premiums collected are greatly in excess of those in Ontario. Abuses and frauds connected with agencies and "ambulance-chasers" have been exposed, and recommendations have been made for their prevention. In England, also, at the present time exhaustive investigation looking to alteration and improvement of the law is now being made. The Manitoba Act, which was previously an individual liability law, is at the present session of the Legislature being changed into a collective liability system similar to that of Ontario.

Elimination of Expenses and Profits

Under the old employers' liability insurance, according to statistics collected in the United States, less than 25 per cent. of what the employers paid actually reached the injured workmen or their dependants. In Ontario, apart from the expenditure for accident prevention associations, over 98 per cent. of the assessments collected from the employers goes for the benefit of the workmen. During 1919 only 1.71 per cent. of the assessments went toward expenses. It is believed that under no other law does so nearly the whole of what employers pay for accidents go directly for the benefit of the injured workmen and their dependants.

With the exception of a boiler explosion in a woodworking factory, which caused the death of five workmen and injury to seven others, the year 1919 has not been marked by anything out of the ordinary so far as the furniture manufacturing and woodworking industries are concerned. The experience in the furniture class, including also piano manufacturing, etc., has, as heretofore, continued to be much better than that in the planing mill and woodworking industry proper, the former being known under the Act as Class 3 and the latter as Class 4. The assessments and the compensation and medical aid for the year, including estimates for adjustment of assessments and for accidents not yet finally disposed of, are as follows:

	Assessments	Compensation	Medical Aid
Furniture and Piano Mfg. Etc.	$ 94,574.00	$ 79,993.51	$11,008.12
Planing Mills and Mfg. of Wooden Articles	186,385.83	189,026.89	24,242.32

Provision for Major Accidents

The boiler explosion above mentioned is costing, in compensation and medical aid, about $18,000. Under the provisions of Section 88 (2) of the Act a limited special fund, called a Disaster Reserve, comprising one per cent. of the assessments, has been formed to meet contingencies of this kind which might seriously and unfairly burden the employers in any class. Out of this fund $12,000 has been assigned to Class 4, to assist in meeting the burden of the explosion mentioned, thus reducing the deficit in the class and avoiding the large increase of assessments that would otherwise be required to be made.

The importance of making every possible effort to prevent accidents must again be emphasized. Accidents in the planing mill and woodworking industries are all too frequent, and it is felt that many of them could and should be avoided. The management and officers of the employers' accident prevention associations are, it is believed, doing their utmost to assist employers in this direction, but active and systematic co-operation and organization are essential if the best results are to be obtained. As a rule it is the industries that are well managed that have the fewest accidents, and it is now pretty generally recognized that accident prevention pays, as a matter of good business, even apart from its effect upon the rates of assessment, and apart from the higher humanitarian aspect.

Merit Rating Again Adopted

The system of merit rating previously adopted was again applied last year. This system permits an extreme variation of 45 per cent. of assessment between the employer, who has a good accident experience, and the employer whose accident experience is bad.

In the furniture and piano manufacturisg class the rates for 1919 are the same as those provisionally fixed a year ago, while in the planing mill and woodworking class an increase has been made. Regard has been had to some expected increase in amount of benefits, especially in the case of widows and children of former accidents. The rates in the furniture and woodworking industries in Ontario do not show the same exceedingly favorable comparison with other places that is shown by most of the other industries of the Province. This argues the necessity of greater attention on the part of the employer to accident prevention.

*Chairman, Ontario Workmen's Compensation Board.

Do You Guess at Your Cost Figures?

Many Woodworkers Give Estimates on Millwork Based on Insufficient Knowledge—As Easy to Guess Below Cost of Production as Above—Uniform System of Estimating Based on Past Costs Desirable

By S. J. Sutherland

(This is the first of a series of articles on shop estimating for woodworking factories. The author, who has had a wide experience in this field, will outline the methods employed in some of the more up-to-date plants. Labor and material costs are high and unstable, so a practical system of estimating is a real necessity if intelligent bids are to be made on all work that offers.—The Editor.)

Every manufacturer is vitally interested in the problem of securing for his manufactured products a price that will represent at least replacement value, together with a profit. All who are familiar with the mill-work business will agree that the poor showing made by many factories engaged in this work is due to ignorance of costs. A part of the product is sold at a profit, part close to the cost line and the balance at a loss. By eliminating the latter class, fair profits should result. There is little likelihood of any improvement until a better and more general knowledge of costs is sought and such knowledge applied when making estimates, thus avoiding the acceptance of unprofitable business.

None of us can afford to be deceived by our own affairs.

A modern shop must be more or less of a school, with the manager as one of the pubils.

Equipment is not the best because you own it.

Obsolete machinery is the foe of profits, the brother of high costs and the friend of bad methods.

It is better by self-criticism to find your own faults than to have your customers do it for you.

A factory manager must keep the balance between cost to manufacture, quality of product and service to the customer.

With lumber and labor rapidly advancing, a factory owner is severely handicapped, unless he has access to accurate material, labor and expense bills so that he knows his overhead costs and can figure his manufacturing costs. Whether the figures are carried in a vest pocket, handbook or a detailed weekly cost sheet taken from the factory records, it is absolutely essential that the estimating department be conducted on scientific, safe and intelligent principles.

Need of Cost Knowledge Great

The owners of planing mills, sash and door factories and general woodworking plants are experiencing trying times. They have all been impressed with the rapid increase in costs. It is doubtful, however, if they have realized the extent to which these growing expenses have cut down profits or increased losses. Notwithstanding the advanced selling prices, the results achieved for the first three months of this year, as reflected in actual cost records, have been more disappointing than ever before. The increased cost of materials, labor and expenses, with reduced efficiency, is simply astounding, and it is doubtful if the end is in sight.

It has been predicted that many contracts made even at present high prices, will prove to be unprofitable when they have been completed. Any losses on work already accepted must be overcome on new business taken if disaster is to be avoided.

In the case of orders calling for a large amount of bench work or labor of any kind, it is extremely difficult to obtain a price that will yield a profit. When higher costs are proven it requires only ordinary intelligence to know that higher prices should be immediately put into effect to avoid serious loss. We are aware of the advanced costs which have already taken place, and there is every prospect of still further advances.

Assuming that one is operating a planing mill and sash and door factory and competing for business, as is the custom, there is the choice of two methods,—First, the old way; plans are delivered with request for an estimate covering the items of mill-work required to complete the job. The estimator or other competent individual proceeds to price the numerous items, many of which or perhaps all of which may involve problems that are entirely new. Prices on many of the items are often established from memory or possibly from figures made on similar jobs, but without any available means of knowing if the figures used on the former items showed a profit or loss.

In many cases not even a comprehensive schedule to fortify the memory is provided, and few, if any, records of costs on previous work are kept. Only in rare instances do those in charge of this important duty of making prices, have any knowledge of the overhead expenses or cost of doing business, or any means of securing such information; notwithstanding they are attempting to make prices to secure the business and yield a profit. Numerous examples might be taken which show that it is no uncommon thing for a variation of from 10 per cent. to 40 per cent. to occur on the same items when estimates are made by different men in the same office, and sometimes even by the same estimator at different times.

Lack of Proper Basis Handicap

This is not surprising. It is a mental impossibility for anyone to commit to memory all the elements of cost entering into the many items manufactured in an odd work factory. The wonder is that any method so crude and hazardous should have been tolerated by men who show progressiveness in other respects. The effect of this policy has been to place the entire responsibility of determining the price at which the product should be sold on the estimator, (the prices realized determine the ultimate earnings of the business) and he without a guide, without a list or any means of knowing the various elements of cost except, possibly, a general idea of cost of material and direct labor, without any record of the results on previous jobs of the

same character, and nothing to serve as a guide for items that are new.

He proceeds to guess, after which the estimate is turned over to someone who often knows still less about the work, and this latter gentleman presumes that the estimate may be too high and proceeds to reduce certain items. At the end of the year the concern finds that the results are very unsatisfactory. They know the prices made were too low but they have absolutely no means of knowing what those prices were because no uniform guide, basis or list was used. Should the company decide they must have a certain percentage more, all they could do would be to instruct the estimator to have his prices average a certain proportion higher and then wait for another inventory.

Average Cost Figures the Solution

No one can determine in advance the exact cost of the most simple item of mill-work, as the workmen or material or conditions under which it is produced will vary and such variations will increase in proportion to the size and nature of the work, so that it becomes a question of averages based on previous experience. The safest guide is that which is based on the largest number of similar operations. Every man must choose as between establishing his estimates upon the schedules which are based upon averages or trusting to the judgment or memory of an estimator making prices in the old way. It is the part of wisdom, in fact the only sane and business-like procedure to assemble the largest possible amount of information, tending to prove the average cost of producing the various items of millwork based on actual experience, and, after having secured such information, that a list or schedule be compiled in convenient fashion so that it may be used as a basis upon which to determine future costs.

Uniform Schedules Desirable

"Uniform prices can only be brought about by the use of uniform schedules or lists. Nothing is more harmful than a wide range of prices. It creates distrust of the value of the merchandise as well as of the mill-man offering it. It invites a wider range of inquiries for prices, oftentimes extending to un-natural sources of supply, in the hope of finding someone still doing business in the old way. Every quotation and sale should be considered from the standpoint of how it will affect the market and future trade."

"Know your cost" is of prime importance. The systematic use of cost schedules is of still greater importance. The cost system makes it possible for the manufacturer to know the profit or loss on work put through the factory. Cost schedules provide the only means by which the manufacturer can anticipate his cost and thereby avoid contracting unprofitable business.

Although accounting has in the past been generally considered as an unproductive expense and has, therefore, not been given the attention which it deserves, there has been in recent years a very general realization that without the accurate knowledge of the cost of production and the expenses of doing business, the manager of a plant is as helpless as the pilot of an ocean liner without a compass. It is gratifying to note that the progress of cost-accounting is making rapid strides.

"This is Mandy"

The accompanying illustration shows a new type of combination serving table and tea wagon recently brought out by an American furniture manufacturer. The idea is a good one and the design could be changed to suit the ideas of the individual manufacturer.

The idea is that this piece of furniture ("Mandy," the maker calls it) may be taken to the kitchen and the entire meal placed on the shelves; there is a shelf for each course and a drawer for the silver and serviettes, and then wheeled to the dining room and the

Practical combination tea wagon and serving table

meal served without having to leave the table. The soiled dishes are placed on the shelves as each course is finished and the table cleared in one trip. As the dishes are washed they can be placed back on the shelves ready for the next meal.

There should be a strong demand for an article of this kind, as it will save many steps for the housewife.

The size is thirty-five inches high, thirty wide and thirteen deep. The wheels are swivel and fitted with felt treads.

Preparing Stock for Bending

In order to make wood pliable for bending, both moisture and heat are required. There should be a moisture content of about 25 per cent., or enough to saturate the cell walls, more than this does not produce any appreciable increase in pliability. Up to a certain point heat increases the pliability of wood very rapidly, but very high temperatures are not advisable. Boiling for any length of time permanently reduces the strength and toughness of the stock. Stock which is freshly-sawn at the mill is usually thoroughly saturated and therefore requires no additional moisture; but heat is needed to produce pliability. Air-seasoned or partly-seasoned material should be sprinkled, sprayed, or dipped in warm water before being placed in the steam retort, and once in the retort it should be steamed at low pressure with moist steam; dry steam at high temperatures will ruin it.

Wood kept permanently dry will last longer than that exposed to climatic conditions.

There Are Foremen And Foremen

Large Employer Describes Types Observed — Initiative Character and Knowledge, Valuable Assets—Should Have Real Interest in Work— Acquisition of Technical Knowledge Advantageous

By a Furniture Manufacturer

Did you ever ask yourself "What is a foreman?" The dictionary says: "An overseer, superintendent, or leading man of a number of men." The dictionary is probably right, as far as it goes, but my personal opinion is that a foreman in a furniture manufacturing establishment is anything from a millstone round the neck, to a priceless jewel. In this article, it is not my intention to give pointers on technical details to foremen, but rather to try and indicate some of the qualities and methods that make a foreman a jewel instead of a millstone.

In the first place let me illustrate by a comparison of two foremen in different factories, both of which have come under my close personal observation. One gets a salary of $1500.00 a year. He is a man of good appearance, intelligent in conversation,the work turned out of the factory under him is fairly good, (quite up to the average), and he knows how to set and run any machine in the place. He is also well liked by the men. In spite of this he has missed his proper vocation in life; he ought to be part of the machinery in a flour mill.

The Big Salaried Man

The other, in a factory of about the same size, is a man of inferior general intelligence, of uncertain temper, of poor education, (he brings into the office slips of paper about "peace-work"—of which he knows no more than President Wilson) with a salary of nearly $4000.00. The first man is so expensive that it would pay the firm employing him to build a glass case to put him in—if they could make sure of him staying in it. The second one is worth his salary and more.

Now if I could tell you exactly and completely what the difference is between these two men, and tell it in such a way that any foreman could imitate the better man, and assimilate all his valuable qualities as a foreman I would be doing something of priceless value to the furniture manufacturing industry in general and to most foremen in particular, but one cannot expect that at the price of this paper.

Get the Most from Each Department

The question is further complicated by the fact that some of the qualities that make a good foreman, or for that matter, a good man of any kind, are innate. The dictionary says the word "innate" means "inborn, not acquired." All the writing in the world won't make a coward into a brave man, or a sneak into a loyal man.

"Mais, revenons a nos moutons," which, being interpreted, means "Let us get back to our sheep, or, in this case, foremen." The better one was loyal to to the firm that employed him; he loved his work, and would put his whole soul into turning it out well and into getting each department to run up to its full efficiency. He was not a "slave-driver" and his men respected him, but he was not satisfied with anything less from a man than a full day's work. It seemed as if he would sooner break a leg than let one department fail to keep the next one supplied. If difficulties cropped up, as they have a way of doing in furniture factories and other places, he was always "right there," and faced them with sober commonsense. So much for his "innate" qualities, which are of even more importance than acquired technical knowledge, although that, of course, is essential.

His Heart Not in the Work

The inferior foreman, whose technical knowledge was fully equal to the other's, was of an easy-going disposition. He would put a man on a machine and not bother whether he got a day's work from it or not. He would not worry if one department got ahead of another. If goods "in process" got "hung up" on account of some department being behind, he would think it was "too bad" and let it go at that. The work he turned out was fair, as above stated, because he knew "how," but he never got within 15 per cent. of the quantity of the other men. His firm was not gaining any headway, while the other was doing well, in spite of the fact that they were paying their foreman and employees generally a higher wage.

Now, Mr. Factory Foreman, my most earnest desire—at the present moment—is to be able to tell you something that will be of service to you. If I could get your salary raised I would be delighted. Perhaps if you will "read, mark, learn and inwardly digest" the following advice, and also act upon it, it (your salary) will grow, itself. I hope so.

Questions for Self Analysis

First. Ask yourself: Am I playing the game as well as I can? Is the work turned out as good as we can make it? Could we get more out by better methods, say, by getting the firm to bonus any set of men that will give us more work, by putting in a better machine here, or by using a different method there?

Second. Ask yourself: Am I giving my firm the best judgment of which I am capable? Am I loyal to their interests and courageous in the face of all difficulties that come up ?

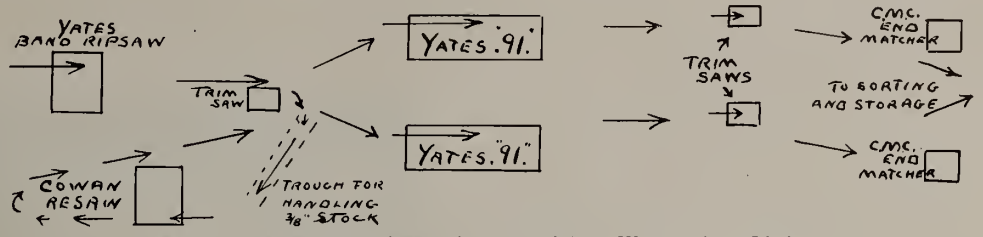
Third. Get all the technical knowledge you can. Study books on technical subjects connected with your trade. Read about new machines; some of them are good. Read trade papers. The Canadian Woodworker sometimes has a good article or two.

First, "Iniative"; second, "Character"; third, "Knowledge"—these three, and the greatest of these is—well, I won't say, but why not take the lot?

Let me just say that if you have them all you may not get more pay, but you will be worth more, and that's better—isn't it ?

Serving Trays Proving Popular

A line which has proven very popular, especially during the last holiday season, is the better grade of serving trays. The damask base, covered with glass, has been the big seller, because of the almost unlimited variety of designs and colorings to be had; but the mahogany and walnut all-wood lines have also been much in demand because of their rich effects.



Layout of hardwood flooring equipment, Midland Woodworkers Limited, Midland Ont.

Newcomer in Woodworking Field

Large Midland Plant Taken Over By Recently Formed Organization—Efforts Centered on Hardwood Flooring, Sash, Doors and Panels—Equipment Modern and Complete

One of the newer firms in the woodworking field is the Midland Woodworkers, Limited, Midland, Ont. This concern was recently organized to take over the plant and business formerly conducted by the Georgian Bay Shook Mills. The manufacture of boxes and box shooks, as conducted by the old company, has been discontinued and production centered on sash, doors, hardwood flooring and general woodwork. The building taken over contains about 6,500 sq. feet of floor space and employment will be furnished for about 200 hands. The excellent rail connections and waterfront facilities which this plant enjoys places them in a favorable position for handling a large volume of business.

The reorganozation of the plant, which is about completed, has been aimed at making each department a separate unit. This will enable each line to be manufactured with maximum efficiency and should tend for high production.

Modern Hardwood Flooring Plant

The hardwood flooring produced includes 3/8-in. and 7/8-in. stock in oak, birch, beech and maple. The lumber, after being seasoned, is thoroughly dried in a Grand Rapids vapor kiln and then run into the factory, where it is ripped to width on a Yates power feed band rip saw. The small kerf made by this machine ensures that the fullest advantage is taken of every foot of hardwood which is run into the mill. The accompanying sketch gives an idea of the layout of this department. The stock progresses in a straight line from the entrance to the store room. The only deviation from this is when 3/8-in. material is being run, then the stock from the band rip is taken back to the Cowan band re-saw, where it is split in halves. As the stock is passed to the resaw in a trough or chute the confusion consequent upon two lines of material crossing is eliminated.

Between the band rip and the stickers—two Yates No. 91's—a trim saw has been installed to cut out bad ends and large knots as the stock goes to the stickers. The two saws behind the flooring machines are used to trim the ends and cut out all defects as the matched stock passes to the C. M. C. end machers. From here the sorters now take the flooring, grade and bundle it, the different lengths being sorted on horizontal racks. The bundles are stamped with the grade length and other information and run into the storage room. Production runs about 75,000 feet weekly.

The other half of machine floor is fitted up as a planing mill, the equipment including a Cowan band resaw, C. M. C. power feed rip, and three stickers—one a Yates. These machines take care of the mouldings, handrailing and other forms of general planing mill work.

Door Department Busy

The sash and doors are made on the second floor. A separate kiln is operated for the softwoods used in this department. The two kilns, one for hardwood,

Preston belt sander in Midland Woodworkers' plant

have a capacity of 150,000 feet. The stock is carried to this floor on a chain elevator and is ripped to width on a C. M. C. power feed rip and then dressed on both sides. The next machine is the trim saw, on which the stock is cut to the required lengths. The rails and mountings are tenoned and coped on a Hayes double end tenoner and then, with the stiles, pass along to the boring machines. The rails are bored on a Hayes multiple spindle double-end machine, which bores both ends at one operation. Another Hayes multiple spindle machine handles the stiles. As the panels have been prepared and sanded, when the stock is run through the sticker, the doors are all ready for assembling.

The dowels are made on a dowel sticker and cut

to length and pointed on a special automatic machine. Another special machine drives the dowels in the ends of the rails, the required number being forced in at one operation.

Some Changes Contemplated

A gluing machine, with treadle attachment, glues all the holes in the stiles. The rails and panels are put in place and the door laid in a power clamp which forces it together. This press is fitted with a squaring attachment so that if the rails were tenoned true and square the door emerges absolutely square. As the stiles were stamped with the size, number and grade before assembling, the sanding of the doors completes the operations and the doors are ready for shipping out.

Practically all the door making equipment in this plant, such as power clamp, dowel sticker, double tenoner, automatic boring machines, etc., was manufactured by the E. B. Hayes Co., Oskosh, Wis. This concern has been taken over by the Jenkins Machine Company, Sheboygan, Wis. The Garlock-Walker Machinery Co., Limited, Toronto, are the Canadian representatives for this line of equipment.

The output of this department runs from 250 to 300 doors a day. This will be increased to 500 daily. To produce this latter number it is necessary that all special doors be made in another department. When this is done the door department can be kept steadily on large runs of stock doors. A tenoner and sticker are being added to the sash department and when installed will be used for special doors.

The sash-making equipment consists of the usual run of sash machines, such as a Cowan sash sticker, with plowing and boring attachment. Cowan chain mortiser, Cowan sash relisher and mortiser, arm sander and sash clamp. Other general purpose machines on this floor include a Hall & Brown panel raiser, Whitney planer, C. M. C. double cut off, Cowan shaper, band saw, Preston belt sander and other pieces.

Panels Form Part of Outfit

A veneer department is being operated and when fully organized and equipped, will be up to date in every respect. In addition to making built-up panels for doors and special work this department will cater

Installation of Hall & Brown panel raiser

to the demands of the furniture and phonograph trade for panels in various sizes and woods. The equipment consists of Preston veneer taping machine, Jenkins-Falls veneer jointer, Merrit power veneer trimmer, Perkins glue spreader and Cowan screw clamps. A hydraulic press will be added in the near future. This machine should effect a saving in manufacturing costs as well as increase the output of this department.

Jenkins-Falls Veneer Jointer in Midland plant

A few machines have been conveniently installed to take care of the milling in transit trade. These are so arranged that the lumber is unloaded from the car directly on chain carrier which takes it to a Yates No. 91. From this machine the stock is loaded directly into another car, thus the work is done with a minimum of effort and handling. In addition to the "91", a Yates double surfacer and a six-inch band resaw are available for transit work.

The personnel of the new company is as follows: A. H. Vanderburgh, Toronto, president; W. H. Firstbrook, Toronto, vice-president; R. H. Scrivener, Midland, secretary-treasurer; W. Benson, Penetang, director, and F. M. Beatty, Midland, managing director. Mr. Beatty has had a wide wood-working experience. Prior to taking hold in Midland he supervised the erection and managed the Saskatoon plant of Cushing Bros. & Co., Limited, of Calgary.

New Montreal Sales Office

The Engineering & Machine Works of Canada, Limited, St. Catharines, Ont., owing to the rapidly increasing demand for their products, consisting of boilers of all types, horizontal, vertical, locomotive and marine, tanks, plate work of all descriptions, etc., and particularly in connection with their recent and very successful venture, the manufacture in Canada of the Keystone Light Traction Excavator, Model 4, have found it necessary to open another eastern sales office in the Birks Bldg., Montreal, where inquiries can be more quickly and satisfactorily handled. This is in addition to their Sales Office in the Sun Life Bldg., Sherbrooke, Que.

The more prosperous the farming community the more need it has of forest products. Lands in Western Canada not fit for farming are set apart as national forests and reserved for the use of the surrounding community to supply it with firewood, rails and sawtimber. Regulated use by stock-owners of the grazing and hay in the forest reserves is provided for. Help to protect the people's forests from their enemies, the worst of which is fire.

Putting Wheels Under The Lumber Yard

Modern Way of Storing Stock Eliminates Excessive Handling — Lumber Unloaded From Railway Car to Kiln Truck — May be Started on Small Scale — Releases Hands For Productive Work

By J. C. Heath

It costs money, good money, to handle lumber in and about the ordinary woodworking plant and yard. Did you ever stop to consider the amount involved in paying for this unproductive labor or if any of the money could be saved by adopting a more efficient method of handling stock?

Here is the routine followed in many factories. The lumber is unloaded from the car to a wagon and hauled to the yard where it is unloaded and piled. When required, it is unloaded on a wagon and taken to the dry kiln where it is unloaded and piled on the kiln trucks. After being dried, it is loaded and, perhaps, being sorted, on a wagon again and taken to the factory where it is finally worked up.

Thus the stock is often handled from four to six or seven times, requiring the services of a team and a number of men. You will, probably, say that you do not do things that way; you have a more efficient method. It consists of a track, connecting kiln and factory, and the loaded cars are run from the kiln into the plant without further handling. This saves one handling, but is not there some way of reducing the number of times the lumber is handled down to one and thus dispense with the services of a number of men, and the team, that are not producing—unproductive labor—or at least putting these men at productive labor?

Many large plants have adopted the idea of placing their lumber yard on wheels. The accompanying sketch gives an idea of how this may be accomplished. A system of parallel tracks, together with transfer cars, is employed so that the lumber may be piled from the railway car directly on the kiln car and then stored in the yard for air-drying, taken to the kiln and from there moved to the factory without any further handling.

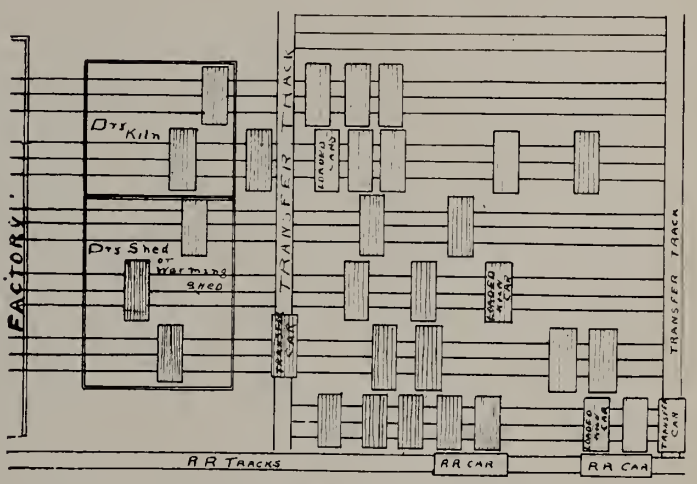
The tracks are laid on a series of concrete blocks. These provide a good foundation for the rails and in addition as they are 12 in. or 15 in. high, keep the stock well clear of the ground. By having two transfer tracks and a sufficient number of parallel rails, cars may be shuffled around so that any desired load of lumber may be picked out and moved into the kiln.

The cost of installation may deter many factory owners from putting down such a system. It is not necessary to do it all at once as it may be started in a small way; in fact unless one had a clear yard to work on, it would be impractical to attempt a complete installation at one time as it would mean that numerous piles of lumber would have to be moved. The better plan would be to start in a small way and then extend the system, from time to time, as circumstances permit or warrant.

The writer recently visited the plant of a western Ontario manufacturer, who had adopted this idea. He operated a progressive type kiln about 125 ft. long, and had placed a set of parallel rails, mounted on concrete piers, along one side of the kiln. This gave him a storage space, 125 ft. long, that would accommodate loaded cars containing about 125,000 ft. of lumber.

The transfer track was run right to the railway siding so that the lumber was unloaded from the cars directly on the kiln trucks and run on the storage track and taken from there to the kiln as desired. His plans include gradually extending this installation until the whole stock of lumber will be carried on wheels. When this is done, handling costs will have been reduced to a considerable extent.

In addition to the saving effected in the cost of handling the lumber, the storing of the stock on cars where it is carefully piled and stuck, insures that the lumber will remain straight and true while being air dried. Another feature is that where the piles are kept



System for storing lumber on kiln trucks

so far from the ground, the air has a better chance to circulate and the lumber will be in better shape enabling the kiln-drying period to be reduced. The saving in preliminary manufacturing costs effected through some such method would amount to a considerable figure during the course of a year.

Manufacturing Furniture Trimmings

Messrs. C. C. Larsen & F. Shaw have recently acquired the business of Messrs. C. C. Larsen and F. Clarke at Walkerton, Ontario, for the purpose of manufacturing a full line of furniture hardware, also motor boat fittings, all kinds of brass castings, special stampings, dies, tools and fixtures and special machinery. We understand the firm is fully equipped to handle any work in the above mentioned line.

Mr. C. C. Larsen was formerly chief engineer with the Canadian Linderman Company, Limited, Woodstock, Ont., and previous to this was connected with the leading manufacturers of furniture hardware in the States. Mr. F. Shaw, who is a brother of Mr. J. R. Shaw, general manager of the Canada Furniture Mfrs. Ltd., is also secretary-treasurer of the Canada Spool & Bobbin Co., Ltd., of Walkerton, Ont.

Care and Operation of Chain Mortiser

Bent Chain Bar Frequently Encountered—Jointing and Sharpening Chains—New Saws Require Extra Attention—Lubrication Must Not be Overlooked

By H. H. Ralphe

The care and operation of the chain mortiser is supposedly so simple that one seldom sees any reference to this machine in trade journals. Like any other piece of woodworking equipment it has little peculiarities of its own and the remedies and adjustments are not always known to the operator.

Probably the trouble most frequently encountered is crooked mortises. There are several things that would account for this fault. As a mortise that is not parallel with the face of stock causes extra work and worry later on it is well to make it a hard and fast rule to check over and make all needed adjustments and changes before running a quantity of stock through.

Keep Chain in Good Running Condition

The chain bar should be examined first. This often becomes sprung from one cause or another. Sometimes a poorly ground chain—one that has a tendency to follow the grain of the wood will gradually spring the bar. The sharpening is usually done on a special outfit which comes with the mortiser but that does not relieve the operator from all responsibility. This work must be carefully watched and executed. The jointing is often done with the chain running at full speed. This is permissible but the teeth must be jointed perfectly square and only the points touched.

A plan often followed is to hold an oilstone on a piece of wood clamped on the table and gradually feed up to the chain so that the points of the teeth just touch the stone. When properly jointed the teeth all cut evenly thus taking a lot of strain off the chain and bar. Another point is that on a properly jointed chain the strain is distributed thus lessening the risk of a broken chain. Any new teeth which may be inserted should be jointed to the same length as the remainder of the chain.

Never Run a Dull Saw

Other causes that account for a sprung bar are, tightening the clamp when the chain is in the cut, sometimes, when heavy pieces are going through, releasing the pressure before the cutter clears the work has accounted for bent bars, the chain being run too tight, not being sharpened often enough, and not being jointed square across, which leaves the teeth longer on one side than on the other. The best way to correct a bent bar is to replace it with a new one. Needless to say one should be certain that the trouble which sprung the old bar has been remedied before using the new one.

Another item that requires close attention is the roller bearing and ring at the bottom of the bar. While these are easily replaced yet they should be carefully attended, for with care such as cleaning every day and lubricating with a good grade of grease, they will last a long while without giving any trouble.

New Chains Often Heat

Watch the new chain bar carefully when it is first used. The constant striking of the chain as it leaves the ring will batter the plates which cover the bearing in the bar. Any roughness encountered here should be carefully filed down, otherwise it might cause the ring to bind.

The chain itself requires frequent oiling not less than twice a day when in continuous operation. Place a little oil in an open can and hold it to the chain, revolving the chain slowly through the oil. This method not only lubricates but has a tendency to remove any grit that may have gathered. Many operators keep all the chains in oil when not in use. This is a good practice and should be followed wherever a chain mortiser is used.

Judging Amount of Hook

Should the chain heat from any cause, new ones often will, do not attempt to cool it with water. Take it off and let it stand awhile. A good way to break a new chain in is to run it alternately with an old one, on short jobs until it works into a free easy running condition. This avoids excessive heating.

Regarding the amount of hook to use the principle applied to saws is followed. Where the work is on nothing but soft wood plenty of hook should be given, while for hardwood the hook should be reduced. For general work on mixed woods only a moderate hook should be used.

Production is being speeded up in some plants through the installation of gang mortisers, which have several cutters and permit of a number of mortisers being made at one operation. Other machines which are built with a rapid up and down stroke, can be used advantageously when a greater output is required.

Dining Table Manufacturers Meet

The Central Bureau of the Dining Table Manufacturers gathered recently in convention in Chicago.

The lumber situation was reviewed and no immediate relief from the present shortage is anticipated. The lumber held by the different table makers was about 33 per cent. of the normal supply and not more than 26 per cent. on order.

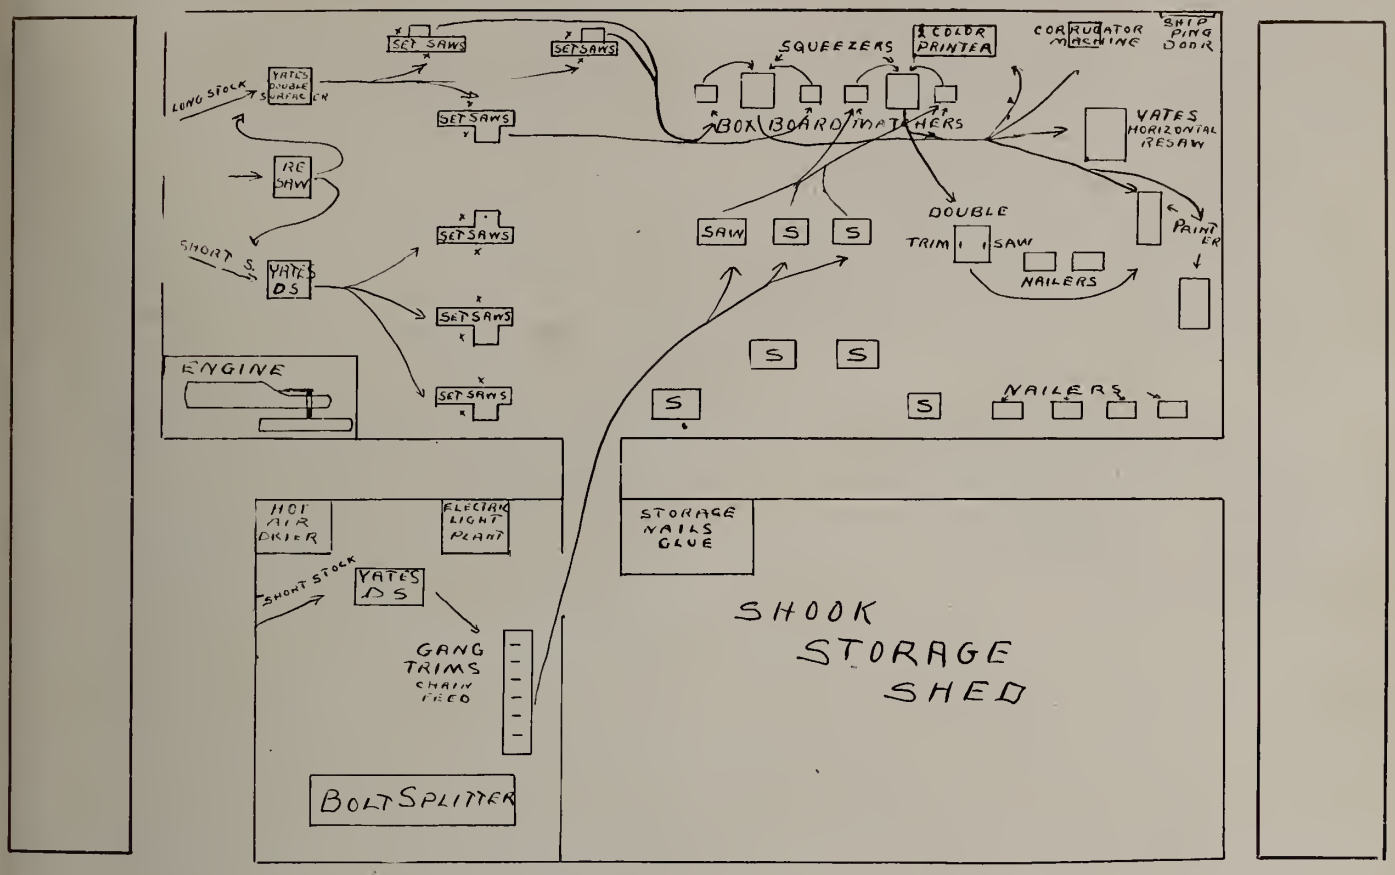
A number of protests from retailers regarding "prices prevailing" were tabled and an effort was made to explain why this policy was necessary.

Simmons, Limited, Open New Building

Between three and four hundred of the Simmons, Limited, employees gathered for the official opening of the new building on St. Ambrose street, Montreal.

The affair proved a very pleasant one and reflected the spirit of goodwill among the employees at the Montreal factory. Cards and dancing were indulged in, the prizes for the former being distributed by Mr. J. H. Sherrard, president of the company, and a buffet supper was served about midnight, after which dancing was continued until the early hours.

The committee in charge were Messrs. J. W. Abbott, A. C. Guthrie, W. Dubuc, L. F. Flanagan, G. E. Buckley, A. Healey, J. R. Lecompte. E. Leger, J. B. Shanahan, C. Lightfoot, T. Kaerney and Roland Gomery, chairman.



Layout of Penetang plant, Firstbrook Bros. & Co., Limited

Modern Shook Plant at Penetang

Well Equipped Factory Turning Out Car a Day of Finished Shooks—Product Made from Mill Waste—Gang Trim Saw Interesting Machine

In addition to their large and up-to-date box factory in Toronto, Firstbrook Bros. & Co., Limited, Toronto, operate a large shook factory at Penetang, Ont., and are constructing a similar plant at Thessalon, Ont.

The Penetang plant is a large well equipped factory, employing in the neighborhood of 100 hands and averaging slightly over a car of finished shooks a day. The material used is practically mill waste, consisting of short ends from the trim saws, called trimmer blocks, and mill cull lumber. At times a certain amount of stock is manufactured from short bolts.

The work is carried from machine to machine on trucks, the floors being kept absolutely clean to facilitate the moving of the stocks. A blower system carries the lighter waste from the different machines and suitable trucks with a box attached is placed at the saws to hold the small ends and edgings. The operator or helper chucks the wood waste in these boxes and a couple of boys keep moving them away and bring up empty trucks.

The equipment is laid out so that the work goes through with a minimum of effort and confusion. The long stock, mill cull, is routed differetly from the trimmer brocks. The dressing is done on Yates double surfacers, three being employed. The long stock goes to the saw sets, a combination cut-off and rip saw. These are manned by two men and a helper. The ripsaw man takes the stock from the cut-off table, thus eliminating all unnecessary handling. From here it is taken to the matchers.

The shorter material after being dressed is cut to length on a gang cut-off. This machine consists of ten or twelve adjustable saws mounted on an overhead spindle and an automatic chain feed to carry the pieces under the saws. The saws are usually set to cut both ends and sides and the stock is placed so that it will be cut to the best advantage. The men feed this machine and the helpers behind remove and sort the pieces, piling them on trucks. They are then taken to the rip-saws and edged and sized and from there to the boxboard matchers.

The matchers are set in batteries which consist of two matchers, together with a boxboard squeezer. This arrangement tends for high production with very little handling. After the stock is matched and forced together, the routine varies, depending altogether on the box being made.

The balance of the equipment consists of numerous rip and cut-off says, three Morgan printers, Yates horizontal resaw, six Morgan nailers, corrugating machine and automatic double trim saw, together with a completely equipped filing room.

Excellent trackage and loading facilities have been provided and as far as possible the material is loaded in cars as manufactured. A large warehouse gives

ample storage room should there be a dearth of cars, but needless to say, it is used as little as possible.

Both the Thessalon and Penetang plants are under the supervision of W. Benson of Penetang.

Standard Apple Box Specifications

At a fruit growers' conference which was held recently in Seattle, Wash., it was agreed that the following sizes be adopted for specifications and footage:—

No. 51—N. W. Standard "Heavy," 13/16 and 3/8, 18 x 11½ x 10½.

	Gross	Net footage

Two piece ends properly fastened with three corrugated metal fasteners have proven and will be considered as standard or equivalent to one piece sides. One or two piece sides satisfactory.

The object of specifying a number is with the intent of eventually dealing by number only, which will eliminate the necessity for naming specifications in referring to any one of the three boxes.

The numbers 51, 52 and 53 have been adopted instead of numbers 1, 2 and 3 with the view of eliminating any reference to grade, which might be the case should the smaller numbers be used.

It is the intention to supply all fruit growers with a copy of these specifications just as they appear here with the exception of the footage. It is desired that the fruit industry and the box manufacturers become so familiar with the numbers as pertaining to these specifications that the name referring to "heavy," "medium" and "light" can eventually be eliminated.

New Patented Box Construction

A patent has been granted Henry J. Williams, of Mobile, Ala., for a new and useful improvement in shipping cases, which it is claimed that it will revolutionize the box-making industry in this country.

It is also maintained that through the use of this patent it is impossible for thieves to break into a box without leaving a trace, and that such a box will be in demand by practically all the large shippers of the country, as there is no telling how much is lost every year by boxes being broken into, some of the contents removed and the container closed by replacing the nails drawn.

This patent box is very much stronger, though it weighs only about two-thirds as much as the boxes now in use, saving freight and express charges every time it is used.

It requires 108 large nails in an ordinary box 32 in. x 32 in. x 33 in., while only four are used in this new way. The invention consists of bevel-edged shoulders with little steel straps drawn over the corners in a slanting manner, causing them to act as wedges as the strain comes on the box. Small cement-coated nails driven through the strap and beveled edges of the cleats will resist 1,400 pounds' strain at each fastening. The box may be used over and over again by just cutting the straps that hold on the cover when opening it.

It would seem that the problem of placing on the market a box for which there has been a demand for many years has been solved, for this box with all its commendable features can be produced for less money than any now in use for the same purpose.

Ottawa Veteran Celebrates Birthday

John R. Booth, the veteran lumberman, pulp and paper manufacturer and railway builder, celebrated his 93rd birthday on April 5th and received messages of congratulation from all over the continent. Mr. Booth spent the day as usual in working and in getting his photograph taken. The latter has been a custom of his for some years now as an incident to passing each successive milestone. The members of the office staff and superintendents sent a bouquet of ninety-three roses to his home.

Mr. Booth has resided in Ottawa since 1857, when he landed with only $9.00 in his pocket and went to work for 60c a day. He later operated a small shingle mill from which his present mammoth plants have developed. He has always taken a deep interest in sports and recently faced the puck in the Ottawa-Seattle Stanley Cup hockey series.

Turpentine and Resin from B. C. Fir

A new industry for British Columbia which, according to its advocate W. C. Oliver of the Douglas Fir Turpentine Co., of California, promises to have most wonderful possibilities, is being considered by Hon. T. D. Pattullo and the experts of the Forests Products Department.

The Douglas fir, which Mr. Oliver describes as "the most valuable economic timber in the world and one of the prime assets of British Columbia," can, he declares, be made to produce hundreds of millions of dollars worth of turpentine, resin and other by-products while at the same time the timber growth of the tree can be enormously accelerated.

Machinery & Equipment

Two Color Box Board Printer

The fine distribution of ink, accuracy of register and printing, the simplicity and quick adjustment of the Morgan Two Color Box Board Printer make this machine a new feature in box making.

The smooth and complete distribution of ink insures an accurate, uniform impression on each board. The machine is built for accurate work, but is also a rapid printing press, making from sixty to eighty impressions a minute. The changing and re-arranging of the dies is quickly done. All adjustments are made from the front of the machine.

The latest model Morgan printer is equipped with a safety release device which automatically and instantly stops the feed chain in its forward movement in case a board becomes lodged from any cause whatever, preventing any part of the machine being broken.

Another feature of this new machine is the gearing which drives the cylinders and rolls. These gears are always in perfect mesh and require no adjustment when the cylinders are raised or lowered for various thicknesses of wood. The play, due to slight variation in thickness of stock, is taken up by the springs supporting the meshed gears. It is regularly fitted for belt drive, but can be equipped for direct gear connected motor drive, a seven and one-half horsepower motor being used. It will print stock as long as 40 inches and as short at 4 inches, and any width up to 24 inches.

Strongly built to stand the continuous use of box factory work, accurate and speedy, the Morgan Two Color Box Board Printer is in every sense a high-class, up-to-date machine. Full particulars may be secured from the Morgan Machine Co., Rochester, N. Y.

Montreal is to borrow $3,000,000 from the Provincial Government this year for housing purposes.

Portable Electric Drill

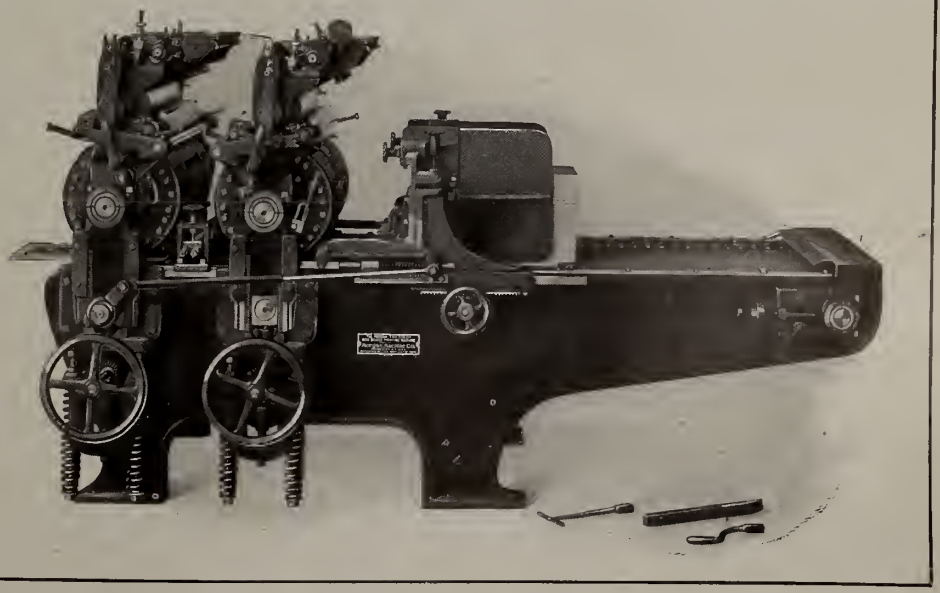
The Dumore Model 1-D portable drill is a light type of electric drill admirably adapted to the rapid boring and countersinking of small holes in wood and metal. Will bore up to 3/16 in. in steel, and

Light "Dumore" Model 1-D

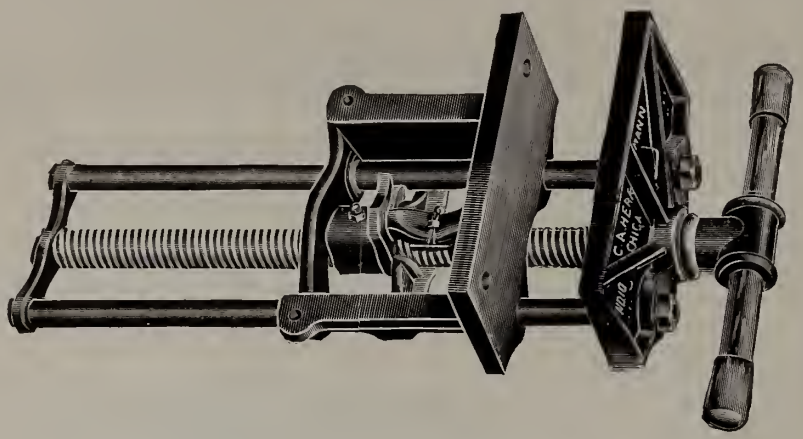
as large as 13/64 in. in wood and alloys. The offset spindle enables the drill to be worked at any angle, in corners and other hard-to-get-at places. It is small and may be handled with great facility, the overall length being but 10 in. and the weight 4¾ pounds. It is manufactured by the Wisconsin Electric Company, Inc., Rachine, Wis.

Quick Acting Vise

The Herriman Master Vise is a time and labor saving device that should appeal to all woodworkers. It is made in three sizes—7, 8 and 10 inch—the first size opening 9 inches, while the other two open 12 inches. Can be had to open wider if desired. This vise need not be screw loosened or screw set, a slight movement of the handle locks or unlocks the jaws. It is positive in grip and very rapid in action. The jaws are planed true and bored so that wood facings may be attached. The use of this vise reduces the time required in opening and closing the ordinary



Efficient two-color printer



Slight twist locks or unlocks this vise

Compact Colladay scroll saw

type of vise. The O. E. Johnson Co., 1293 W. Washington Blvd., Chicago, will gladly furnish full particulars.

Automatic Electric Screw Driver

The accompanying illustration shows an efficient type of electric screw driver. It is light (weighing only six pounds) easily handled and will drive all sizes of screws. It may be fitted with two spindles revolving in opposite directions, the right-hand spindle driving in and the left hand taking out. The electric motor is connected to spindles through gear and worm drive.

May be equipped with left hand splindle in place of handle

The bits do not revolve until pressure is applied, engaging a positive clutch. thus the bit can be readily entered in the screw slot and the risk of marring the wood surface eliminated. One man with this machine should drive as many screws as three or four men with ordinary drivers. For full particulars write Geo. C. McKay & Co., 1046 St. Clair Ave., Cleveland, Ohio.

Self-Contained Scroll Saw

An examination of the accompanying illustration of the Colladay scroll saw will show that this is a practical, efficiently designed machine. It is compact and self-contained in every respect. The table is 32 in. by 38 in. and allows for a swing of 37½ in. clear of arm. The height from table to arm is 10½ in. and 12, 14 or 16 in. saws may be used. The cross head is made of steel and gun metal and carefully strapped to insure long service. The springs and leaves are made of carefully selected ash, the tension being very evenly graduated. It is fitted with belt drive counter shaft but may be had with motor drive through flexible coupling on lower shaft at a slight additonal cost. Floor space 36 in x 53 in., weighs 800 lbs., power required 2 h.p., speed of counter 900 r.p.m. For full particulars apply to the Colladay Machine Works, Philadelphia, Pa.

Looking After Narrow Bandsaws

Correct sharpening and setting of band saws, writes a correspondent, go far towards prolonging their life. Some operators believe that it is always best to sharpen from each side, bevelling every tooth similar to a hand saw. Others are as equally convinced that the best results are obtained only if each tooth is filed straight across. Certainly the latter method is the easiest and consumes less time.

Much diversity of opinion also exists as to whether the use of rounded corner files actually does minimize the tendency of a saw to fracture from the tooth edge. My own experience certainly prompts me to this view, but would the use of a sharp edge file accentuate the common danger of breakages arising out of a flaw occurring on the back edge? I think not. Rather am I inclined to think such happenings point more to a lack of support to the back of the saw, the thrust not being properly taken up.

Personally, I always use a rounded saw file, as I find it use prevents undue weakening of the blade; and this is a consideration. And I always endeavor to bring each tooth up with a single stroke of the file —that is, unless a saw is in a very bad way.

Although my saw doctoring outfit includes a setting hammer and a bevelled block, I rarely use it unless on saws over 1 in. wide. I adopt the more speedy file method. With a length of the saw secured in the sharpening vice, I take an old file and bring it down between the first two teeth, and press the handle slightly to the right; this sets in different directions both teeth simultaneously.

Having thus gone through the full length of saw in the vice, the teeth are then sharpened, and a further section proceeded with.

Most of the land on which our Canadian forests now stand is not suitable for agriculture but it is suitable for growing fine crops of trees to keep our sawmills, our wagon factories, our furniture factories, and our paper-mills running at full force for ever. Let us all take part in protecting our valuable forests. Fire is their enemy. Therefore, be careful with fire.

Upholstering and Trimming

"For Men Are Square"

By D. D. Fennell*

I am sure that we Buffalo people feel very much gratified at having such a representative body of men in industry here at this convention, particularly because Buffalo has become an industrial city. Through a great many years of its life it was purely a commercial city, but in the last 15 months we have added a hundred industries to the city of Buffalo, which gives you some idea of what is being done by industrial Buffalo, particularly through the activity of the Chamber of Commerce.

I do not propose to discuss with you the technique of the "industrial relations" proposition at all, but I am going to draw out a few fundamentals that I believe are basic. I want you to know that I am little concerned as to whether we are to treat with the unions or not to treat with them. In fact, I am little concerned with unions, or with the opposition—the non-union movement. I wish just to make this prediction, that within fifteen years there will not be in the United States an organized Federation of Labor. I have a good reason for stating that, and my reason is that men are seeing so far and are planning so wisely, and are endeavoring to deal with this problem so infinitely just, that the management in industry will offer more to the men than any labor leader can possibly advocate. The only thing men demand is sheer, stark-naked justice, and they are getting it—more and more every day.

Six words will epitomize all that I have to say, and those words are—vision, spirit, aristocracy, democracy, justice and brotherhood, and in those six words I am going to give you a program that is absolutely workable along the lines of industrial relations.

Vision

First we have vision. We fellows in industry must acknowledge certain facts. We must know that in the early days of industrial life the American workmen did just what we told him to do—he had no say whatever concerning the conditions surrounding his job. He was given a job to do and he was supposed to do it for what it brought—it was not his to say how, where or when he would do it. This was the day of "Master and Man." Apprentices were trained in little shops by direct instruction, and their years of apprenticeship were long, and without pay.

After a time machinery came in and with its coming the master found that he could use a number of men. His unit developed until there was need for help in supervision, and then was introduced that most strategic feature of all industry—the foreman. We have come to recognize the foreman as the keystone in the arch. He is the man in direct contact with the men, and it is through him that we must get our vision to the men. If we are successful in this, we have accomplished a great deal towards settling the usual small difficulties in plants.

Training the foreman, then, is a very fundamental thing. To-day I believe that if I were operating a plant of any size I would spend a great deal of time trying to make my foreman understand me, and then have them represent me adequately and properly to the men.

In the early days we selected our foreman because he was a good workman. The human element was not seriously considered. Labor was bought and sold and we did not understand that the foreman who was an embryonic psychologist, was worth 20 foremen who might have the skill of any man in the shop. The man who had the right kind of feeling for his men, who was bound to them by a common interest, and who had a little of the milk of human kindness in his heart, was worth more than all the skilled men copied from mental machines.

Vision: All the preachers, theorists and economists, labor leaders, welfare societies and whomsoever you want to include—are not the men who are going to do great things for America. The hope of America, the salvation of America, will come through industry. There is no class of workers that feel more keenly the need for production and the dollar that it brings than the men who are in the industry.

I was greatly interested the other day when two gentlemen wished me to go out to the largest plant in the city of Buffalo where they were having trouble with the foreman. They could not get the wheels turning and production coming along.

Before I talked with the supervisors in that plant I talked to the president, with whom I am personally acquainted. I said, "Bill, tell me what you are trying to do. You are a rich man. You have plenty. You can retire now and take care of yourself for a hundred years. What are you trying to do?"

His answer was, "The vice president and the secretary and I could, to-day, sever connections with this firm and have plenty; but we are not in this thing for the mere money we can get out of it. Naturally, we hold out profits as an incentive to which we must work. Any industrial scheme which does not develop ambition is a worthless kind of dream. This is my job, right here. This is my duty to perform right here. I owe to America and these workmen all that I have and all I have in me until that day when I must totter away because I can do no more; even then I am still going to try to have an interest and some definite connection with this plant of mine which has meant so much to me. We are working to do something to serve the men, the community, the family.

I asked, "Bill, are you doing it? Are you working this thing out here or simply talking?"

His answer was, "No, I am not simply talking. I believe it is my bounden duty and my deepest conception of that duty to do this thing. We are going to have a big banquet and we will have 600 of our

*Address before National Association of Upholstered Furniture Manufacturers at Buffalo, N.Y.

leading people—superintendents and office force and the unit men all through the plant—and I wish you would come up and make an address—discuss some topic and then listen to my speech. I am going to commit myself to these people."

At the banquet that night his speech was something like this: "Ladies and Gentlemen, we did $20,000,000 worth of business this year. I did not do it—no one man did it—we did it."

All through that little unostentatious simple address, a talk from heart to heart as he spoke to those women and men gathered there, he just put emphasis on that fact.

I was in this man's office a short time ago when an engineer brought in a plan for a building and the bill of specifications was beside it. The building was to cost so much, machinery was to be so located, ventilation, rest rooms, and so on. When we got through, the president said, "Bring me in a perspective of the building." There was one ready and the engineer brought in a picture of the building. It was one of saw-tooth construction. Architecturally it was nothing worth looking at.

When he got all through, the president said, "Now tell me what it would cost to do so and so, and so and so, and have bushes and flowers and lawns and so forth."

The engineer replied that it would add 35 per cent. of the original bill to it.

I asked, "Bill, what will your stockholders say?"

His answer was, "Wait until they see the profits that will come out of this plant. Wait until they see the 35 per cent. returning many times over. You may be sure that they will say, 'We will follow you all the way when it is all over. I will tell you what it is for. This great big organization of ours is a family; it is a domestic proposition quite as much as the house we are living in.

"I want production to the very maximum. I want no shirkers in this plant. I want a man to give everything he has for his job. I don't want to stand by as a hard, exacting, parasitical individual and tell him to give me that production regardless. I want to be able to say, 'I am making a place for you, which, when you approach it in the morning, you will approach it with the same anxiety to get on the job as you feel when you turn at night to that haven of rest which you know as home.' This is one family, that is another, but they are bound together with a common cord."

He had the spirit to put that across and that kind of spirit is typical of that organization from the smallest boy to the highest in power.

We must have vision. We must see what we must do, and we must have the courage and strength to go to it, reach out to it and grasp the thing. The American wants vision to encourage and challenge his courage and then the man who is proud of his nationality will jump in and strive to reach it.

(Continued in May Canadian Woodworker)

Covering for Porch Furniture

The weather man isn't always very considerate of the feelings of the housewife who prides herself on her taste in furnishing her porch. When he sends along one of his sudden thunder showers, he generally sends with it, as an escort, a high wind that propels the rain obliquely under porch roofs and on to the pretty cretonne cushions and the linen arm and back rests and table covers that adorn the porch. After Jupiter Pluvius has finished shedding his copious tears and passed on to the next county, madam's porch upholstery is in a condition frequently to cause tears from some quarter other than the Heavens.

But this trouble can all be avoided now and without much sacrifice of artistic appearances either. Science has outwitted Jupiter. There is now on the market a material that defies the rain. It is made to resemble leather so slosely that only a leather expert can distinguish it from that. It comes in all the standard leather grains and finishes. It can be artistically embossed or painted and withal makes an ideal covering for all sorts of porch furniture.

The base is a cotton fabric which is coated with a pyroxylin film. It is this film that is water-proof. Rain harms it no more than it does a rubber boot. If it becomes soiled in any way, even with grease, it can be washed with soap and water without the slightest injury.

When housewives become better acquainted with this article, cretonne will have to look to its laurels for it looks as though its days as a porch furniture covering were numbered.

Comfortable Upholstered Chair

The chair shown in the accompanying illustration is a new design recently brought out by H. A. Bywater, Toronto. The lines are very suggestive of the English style of upholstered chair. Mr. Bywater has been conducting a retail upholstering business but is

An attractively designed chair

branching out and going after the wholesale trade.

The general appearance of this chair is certainly inviting. The low, deep seat with the thick springy cushion makes one long to recline in it. It is just as comfortable as it looks.

The workmanship and material is of the best. The cushion is filled with a good grade of curled hair. The usual construction, consisting of springs and curled hair, is followed in upholstering the back and arms. The covering shown is a striped denim in a rich brown. Taken as a whole the chair is very attractive and sho ' find a ready sale.

The Making and Working of Fillers

Provides Satisfactory Foundation—Many Substances Employed—Formulas for Paste and Liquid Fillers

By Dixy Wells

As wood fillers are very important in the proper finishing of furniture, a few paragraphs on this subject should be interesting. There are two well-known kinds of fillers, liquid and paste. The former is used on practically all classes of close-grained woods, while the paste filler is employed on the coarser grained species. The more open the grain the heavier and coarser must be the filling that is applied.

The purpose of all fillers is to provide a perfect foundation. One that will receive the varnish coats and enable them to stand out, producing a flawless surface. To make this foundation coat effective the filler must not only fill the pores but must so saturate the wood cell as to provide for the absorption of the varnish when it is applied. If any wood is not thoroughly filled or an inadequate foundation has been laid, the varnish will not stand out and pinholes, pitting, and other faults will result. The varnish can not be blamed for these defects, as the filler itself is at the root of the trouble.

Surfacer Often Applied

In some cases it is necessary to apply a surfacer over the filler coat, thus supplementing the work of the filler. This surfacer is, in most cases, a liquid filler. Sometimes the ordinary commercial article, or it can be made up in the shop by thinning a paste filler down to a consistency where it can be worked with a brush. Shellac is often used or the ordinary commercial liquid filler much reduced.

Fillers come in many colors and one should be used that matches the wood to be finished. For instance when the furniture is to be finished natural, such as oak, ash, etc., the no-color fill must be employed. Many beautiful effects are obtained in our modern factories by not coloring the wood, but by using a colored filler of the required shade.

May Be Made in Shop

While many of our filler manufacturers are supplying standard ready-mixed materials a good preparation can be made in the shop and a reliable formula is as follows: Mix two parts of good coach Japan and three parts of raw linseed oil, gauging them by weight rather than by measure. Add to this combination a sufficient quantity of puverized silica to form a stiff paste. If the facilities for putting this substance through a hand mill are available it will greatly facilitate the work. After going through the mill coloring may be added as required. The mill is used for the purpose of grinding the materials finer and ensures a better mixture. Authorities state that fine silica is the best basis that can be used in a paste filler, but this by no means the only one. A very satisfactory filler may be made from corn starch. In this case mix together equal parts of Japan dryer, turpentine and raw linseed oil; after this add corn starch sufficient to form a thick paste. A very good way, perhaps the best is to wet the starch by placing it in a suitable container and pour the liquid mixture over it, then cover and allow it to stand over night. After this it may be stirred to a perfect mixture. When this has been accomplished the result should be about the consistency of thick paint. If it should prove too thick it may be thinned with a little benzine or turpentine.

Equal parts of boiled linseed oil and japan, when thickened with corn starch, also makes a good filler. This should be thinned with turpentine. A finishing room expert recently furnished the following formula: To one pound of corn starch add one-half pint of boiled linseed oil, one-fourth pint shellac varnish and two and one-half pounds of finely pulverized pumice stone. After being thoroughly mixed this may be colored as desired. In making any of the foregoing formulas, uncooked starch is always used. There are many other bases in addition to silica and corn starch that may be used, such as China clay, marble dust, plaster of paris, whitening and others.

Shrinking to be Avoided

Some pastes cause a lot of trouble by shrinking as they dry, thus leaving cracks and partially filled pores. This fault does not occur when the best standard makes are used. A good non-shrinkable filled may be made as follows: Mix sufficient flour and water to form a thick paste. Boil this thoroughly and set aside until cold. This paste should then be thinned until it will barely spread over a board when poured. It should be neither too thick nor too thin. Then mix separately raw linsed oil and whitening in quantities to form a bulk equal to that of the paste and of about the same consistency and then mix the two batches together. A certain amount of dryers will have to be added to secure proper drying. This filler may be thinned out as required.

A certain amount of difficulty may be experienced in getting the right proportions for this formula, but a little experimenting will surely bring results. The chief trouble is in getting it to dry and not too hard, but with a little work and patience it will be easy to make a practical product.

Other Mixtures That May be Made

There are a large number of liquid fillers to meet the requirements of the various woods. One is made from a formula which calls for China clay and carbonate of magnesia, about twice as much as the former as of the latter, the two being thinned with turpentine to a proper consistency. Another filler on the market which enjoyed great popularity was made from pale rosin which, when melted and used with whitening turpentine and coach japan gave excellent results.

On cheap furniture an inexpensive filler is often used, the better grades being reserved for the higher class of goods. On some of the common grades, for

instance, glue may be employed in the composition. Good glue makes more size than a cheap grade, and thus the use of the better grades makes for economy. When something along this line is required make up a good size with glue and water, and thicken it to usual liquid filler consistency by adding a quantity of dry carbonate of magnesia or whitening and coloring to suit. This liquid is practically a surfacer, drying very quickly and may be sand papered within a few hours after being applied. This is an item of considerable importance with manufacturers of cheap furniture. It is also a good material to use on a one-coat job. In some cases a coat of varnish is not given as two coats of this surfacer gives a far better finish, and is often used on cheap lines that will not stand for a more expensive treatment.

Determining the Value of a Varnish

Some Tests Usually Applied by the Progressive Varnish User—Specific Gravity and Viscosity Test—Detecting Adulterants

Formerly the varnish salesman and the foreman finisher talked over the wares the salesman had to offer and decided which would be the best to select for the work in hand. Nowadays the furniture factory asks for a trial order of a gallon and tests it in his own way.

Usually an eight-ounce bottle of the varnish is sealed, labeled and laid away and the remainder put to a practical working test. Some factories employ the following method: Small boards are put through the various finishing processes until they are ready to be varnished. Several coats of varnish which the factory has been using is applied to some of the boards, and then the varnish to be tested is applied to the other. These are then put on racks in the open and exposed to the weather. Changes in the condition of the varnishes are carefully noted. The panels which lose their brilliancy and crack in the shortest time have been coated with an inferior varnish.

Color, Durability and Elasticity

Varnish may be tested for paleness by placing a small quantity of it in a thin glass vial, and comparing it with any standard sample by holding both samples to the light. Another simple test is to revarnish any suitable surface with the varnish being tested, and when the varnish is thoroughly dry rub it quickly with the finger. If the new varnish crumbles up quickly it evidently contains an inferior gum or most probably a large proportion of resin. A good varnish cannot be removed in this way. A method for testing varnish for elasticity is to apply two coats of it to a sheet of linen and after it has properly dried try its flexibility or tendency to chip off by crumbling between the hands.

There are three tests which a first-class varnish must be able to pass at approximately the figures stated, viz.: Specific Gravity, Flash Test and Viscosity. Specific gravity is the weight of anything compared with an equal quantity of water which is 100. The specific gravity of a varnish at 70° F. should be between .80 and .90. This is most easily determined by the use of hydrometer for liquids lighter than water, although it can be figured by a comparison of weights. If substitute oil or gum has been incorporated into the varnish, the specific gravity will show it, as no two oils or gums have the same specific gravity.

Determining the Viscosity

The viscosity of a liquid is determined by the length of time it takes a measured quantity to run through a hole of a certain size compared with the time it takes the same quantity of distilled water to pass through the hole. With a viscosimeter which can be purchased from any chemists supply house, this can be easily determined. The viscosimeter will have marked on it the time it takes 50 cubic centimeters of distilled water to pass through the hole. Allow 50 cubic centimeters of varnish at 90° F. to run through the viscosimeter and note the time required with a stop watch. Divide the time taken by the varnish to run through by the time required for the water to run through and you have the viscosity of the varnish as an abstract number. This should be in the proximity of 15. Any variation in the materials will be indicated by the viscosity of the varnsh.

In filling a long vial or test tube, a good pure varnish will appear without any cloud regardless of its color as some of the most expensive varnishes especially the hard drying varnishes are quite dark in color. Gum varnishes for instance, are darker than wood oil varnishes.

A Very Severe Test

The best and probably the severest test is the glass test. Take a clean piece of sheet glass, and pour some of the varnish on it, then watch it run. If it is a good varnish it will run out smoothly, level perfectly and set dustproof in a few hours, but will require two or three days to harden. Drying on glass will be much slower than drying on wood. Good varnish will not show up brittle by scratching nor will it leave white marks.

Rubbing and polishing varnishes of high grade will not show an impression when pressed upon with the hand. Failure to meet these tests successfully generally indicates cheap gums, the presence of resin, other impurities or imperfect manufacture. After all, however, these tests are not conclusive, and the best test is old Father Time.

Judge by Working Varnish

There are other practical tests, but the ones mentioned are the most common. The practical finisher can tell much by the action and working qualities of the varnish whether or not it is of inferior quality.

There is one point that should always be kept in ind, that is: that there is a varnish for every purpose, no general purpose varnish. The man who would get the best result from the varnish he uses will use only varnish made by a manufacturer with a reputation, and will use for his purpose the varnish that such a manufacturer recommends for that purpose.—Jamestown "Finishing Facts."

Heavy patches on a belt throw it out of balance.

A double cut-off saw will save a lot of work and time.

The Successful Finishing of Mahogany

This Wood Requires Special Care—Sponge Lightly to Raise Grain—Stain Applied Evenly and Quickly—Finishing Imitations

By J. C. Whitlock

IN these times of high prices one is liable to take a chance with something in the way of a finishing material which, under normal conditions, he would never think of doing. Owing to the scarcity of competent help, mistakes will occur with the best material, and when a piece of goods has been finished, but not finished right, it is a rather difficult matter to determine whether the trouble lay in the material or in the manner of application.

I recently visited a large furniture store in one of the border cities and was shown a crotch mahogany dining-room suite which was a beautiful example of workmanship, except the finish, and it was bad. The manager directed my attention to it and asked my opinion as to the cause. The pieces had been well stained, and the color of the wood was all that one could desire; but when a medium strong light was thrown on it there was a greenish cast to the whole which discounted all the other good qualities.

Should Use Pale Shellac

After careful examination I came to the conclusion that the goods had been shellaced with orange shellac, and the shellac had been applied in a damp atmosphere—possibly on a very damp day. It is also just possible that the solvent used in cutting the shellac was not the right kind. But apart from these things, orange shellac should never be used on mahogany unless it is a very pale shellac and used very thin; in fact, no matter what kind of shellac is used on mahogany, it should be used very thin. It should never be used for the purpose of helping build up a body. All that shellac should be expected to do on mahogany is to prepare a fine surface for the varnish.

The trouble seen here is all too common on the cheaper lines of furniture and might pass unnoticed there; but when one sees it on an expensive suite it calls for a note of warning against the causes. To this end we will give a few suggestions on how, and how not, to finish this class of wood. Starting at the very foundation of the finish, which is the sponging before staining. This should be done with as little rubbing with the sponge as possible. I know the more one rubs with the sponge the more the fibres will be raised, and which is really the object in sponging, but there are other things to be considered. If too much rubbing is done, the glue that has come through and remains in the pores will be drawn out and smeared over the surface, giving it a murky appearance after it is finished. Use clear, warm water for the sponging operation, and allow the wood to become thoroughly dry before sanding, which should be done with fine, sharp paper. Let me lay stress on the word sharp, for if the paper becomes dull it will merely press the fibres down again instead of cutting them off.

Apply Stain Quickly

The staining should be done with a brush, and the stain should be applied as rapidly as possible and with little brushing. Do not let the stain drag; flow it on to cover the surface, then lay it off lightly with the brush fairly dry, so as to break the flow and prevent running. If one tries to put on a light coat of stain the work is almost certain to show streaks and laps. If the stain is too dark to permit flowing it on, reduce it to the desired shade. Never wipe a water stain with a rag, as it will smear the glue and stain over the surface, making it murky.

The condition of the work after staining will determine what the next operation shall be. If the wood is smooth and free from projecting fibre and fuzz, one may go ahead and fill it as soon as sufficiently dry, but if it is fuzzy it had better be given a coat of wash shellac, which is 1½-lbs. gum shellac dissolved in 1-gal. of solvent. Put this on with a brush, and, when dry enough, sand lightly with very fine paper before filling.

Dark Filler Used

To show the best advantage the finer markings of the wood, fill with a black filler to make a dark pore. Use pure silex for the base of the filler, with Vandyke brown ground in oil or japan for the coloring matter.

In some instances the filler is followed with a coat of varnish, without any additional preparation of the surface, the object to avoid the very thing we spoke about at the outset of this article. But a coat of shellac makes such a great improvement in the surface, and leaves the first coat of varnish in so much better shape, that the care necessary to overcome the difficulties incident to its use is worth while. As far as possible observe the following rules for applying shellac to mahogany: Use bone-dry bleached shellac, not more than 2-bs. shellac to 1-gal. solvent. The solvent should be methylated spirits of alcohol or a good grade of wood alcohol. Never use any of the cheap substitutes. Never use a shellac that will not thoroughly dissolve in the solvent. If bleached shellac becomes old or affected by a warm, damp atmosphere, only a percentage of it will dissolve, the indissoluble postion settling at the bottom of the receptacle. When one finds shellac of this kind he should discard it all so far as its use on mahogany is concerned. If not too bad it may be strained and used on oak or any of the light finishes, but not on mahogany. If it is such that it would not be wise to use it on any finish it should be returned to the factory, where it can be reclaimed by a process they have for treating this kind of shellac.

Use Shellac Carefully

Never apply shellac on mahogany near an open window, especially on a damp day. If one is putting on bleached shellac and it loses its transparency if touched with the brush after it has become partially dry, even though it recovers its transparency you had better stop long enough to investigate, as there is something wrong with either the shellac or the conditions under which it is being applied. It may be that the atmosphere of the room is damp, in which case you had better do something to dry it. Close the windows and turn on the heat—do something, anything, except to put on shellac under those conditions.

If putting on orange shellac and it takes on a greenish cast when touched with the brush after it has be-

come partially set, the trouble here is as described above in the case of the bleached, and the same rules given there to overcome the difficulty will apply here.

Imitating Mahogany

The comparative scarcity of solid mahogany has forced some to resort to the uses of gum and other substitutes for certain parts, even on the higher priced goods, while still using the fancy veneers on the more prominent parts of the article. Where one does employ a substitute he should try and make it look as near like the genuine article (and not as much unlike it) as possible. Do not stain it any darker than the mahogany veneer which it is supposed to match. If the following process is followed an expert will find it difficult to distinguish it from real mahogany: Prepare a small quantity of stain three or four times as dark as that used on the main body of the work. After the substitute has been stained and is almost, but not quite, dry, put a few stripes on it with the dark stain, using a fine pencil brush for the purpose, and just before these stripes get dry blend them out with a camel-hair blender. In making these stripes be sure and follow the natural grain or figure of the wood.

The writer has always deplored deception in the finshing of our native woods, and no deception need be practiced here. Because it cannot be distinguished from mahogany does not mean that it should be offered as such. Gum has merits of its own on which it can stand. and goods of this kind should be sold for what they are. Call it mahoganized gum, or anything you like, but call the gum, gum; and the mahogany what it is.—"Furniture Manufacturer and Artisan."

Metallization of Wood

The following is a method of treating wood to give it the appearance of metal. The wood is soaked for three or four days, according to hardness, in a solution of caustic alkali at a temperature of 75 deg. to 90 deg. C. It is then transferred at once to a bath of hydrosulphite of calcium, to which a saturated solution of sulphur in caustic potash is added after a lapse of 24 hours. The wood should remain in this bath at a temperature of 35 deg. to 50 deg. C. for about 48 hours. Finally it should be soaked for about 30 to 50 hours in a solution of acetate of lead at a temperature of 35 deg. to 50 deg. C. These successive baths take some time, but the effect is surprising. After the wood has been dried at a moderate temperature, it may be polished with a burnisher of hardwood, and acquires a brilliant metallic lustre, which may be heightened by previously rubbing the surface with a piece of lead, tin, or zinc, and using a glass or porcelain burnisher. The wood then resembles a metallic mirror, and it is very hard and strong.

Keeping Brushes in Condition

How many finishers have experienced trouble with curved bristles in their brushes. The blame for this is frequently placed at the door of the brush manufacturer and no doubt in many instances he is to blame. The manner in which the brush is used and the way it is wiped and put away at night will often account for this trouble.

A brush should be wiped on the flat sides and just to the end of the bristles. When finishing fancy pieces, such as carving and grill work, if the ends should happen to curl they can be straightened by dipping the brush in hot water.

Good brushes are too expensive and too hard to secure to be allowed to deteriate for the lack of a little attention.

Judging Light Value of Colors

Investigations made by scientists prove that dark blue reflects 6½ per cent. of the light falling upon it, dark green about 10 per cent., pale red more than 16 per cent., dark yellow 20 per cent., pale blue 30 per cent., pale orange nearly 35 per cent., while white 70 per cent. Here is valuable information for the woodworker who would increase his shop efficiency.

New Lumber Reckoner

The "Tudor Lumber Price and Freight Reckoner" is the name of a book recently issued by Tudor B Carre, 6034 Prytania St., New Orleans, La. This reckoner will enable anyone to instantly secure the delivered price of a given quantity of lumber, of a stated weight and at a stated price and freight rate. The tables run up to $80 per M. but any combination of figures may be reckoned. Full particulars may be had from the author. Price $2.50.

New British C. I. F. Ruling

The actual presence of an insurance policy among the documents to a "c.i.f." transaction is necessary in Great Britain in order to compel a purchaser to accept the consignment, the British High Court ruled recently in a decision of interest to Canadian exporters. Previously the submission of a certificate that the goods had been insured was all that customary procedure required.

The decision was to the effect that when goods were bought "cost, insurance and freight," the purchaser was not bound to accept the certificate of a broker, or anyone else, that they had been insured, but was entitled to call for the delivery of an insurance policy.

The ruling was the culmination of a suit brought against a purchaser who declined to accept goods because the insurance policy was lacking. His action resulted in a loss to the shippers, as the market had declined in the meantime. The shippers claimed that the acceptance of a broker's note or certificate of insurance instead of an actual policy was allowed by custom.

Possible Shortage of Fruit Boxes

At a meeting of West Coast box men held recently in Portland, Oregon, it was brought out that unless the fruit growers quickly place their orders for this year's requirements they will find themselves short of fruit boxes before the season is over and will not be able to market their full crop.

On account of figures that lumber commands today much of the material that would ordinarily go into box lumber will, this year, be cut into other stock. Unless the fruit packers awaken to the seriousness of the situation with which they are confronted the output of shooks in the Pacific northwest will not be sufficient to carry them through.

The question of standardizing fruit containers also came up for discussion.

The Shortest Cut to a Fine Wax Finish

Compare for yourself the two methods of finishing described below:—

You cannot fail to see the saving on all wax or mission work, made possible with—

MARIETTA
FRENCH LACQUER

The Old Way

(1) Apply the stain.
(2) Thin coat of shellac.
(3) Sand lightly.
(4) More shellac.
(5) Sand again.
(6) Wax and polish.

The Modern Way

(1) Apply the stain.
(2) Thin coat of shellac (or Kopalac).
(3) Sand lightly.
(4) Thin coat of French Lacquer, applied with brush, flannel or cheese cloth.

Result—the same.

With Marietta French Lacquer you take a much shorter route to the same end.

May be applied with brush or spray. Is being bought in large quantities by leading manufacturers. It is moisture proof and will not scratch white.

MARIETTA WOOD FINISH SPECIALISTS

"Good workmen know the difference."

This trade-mark is a small thing to look for but a big thing to find.

How Gibson found a real antique.

AS far back as I can remember, a dingy table in the cellar had been used as a work bench. Last year when the upholsterer was fixing our furniture, he spotted the old table and sent for his friend, Tony Gibson, the cabinet maker.

You never saw two men so crazy about anything.

Work bench! It was a masterpiece. The hand of a great New England cabinet-maker was in every line. Those two workmen could appreciate that old art. They set about it together, with devotion, to restore the nicked, dented, timeworn table.

And they did. Speed-grits did its share in bringing back the original satin-smooth surfaces.

When we got it back, I saw in that glowing mahogany just how it must have looked to its master maker, back in Revolutionary times, when he called it done, and wondered how a thing so simple should look so right.

Manning Speed-grits did the work—every bit, to the garnet finishing paper on the last coat. I know, for I asked, and Gibson said in answer to my question, "*Difference?* When you been at it as long as I have you'll say there's a heap o' *difference* in sandpaper."

Don't say Sandpaper —say Speed-grits

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

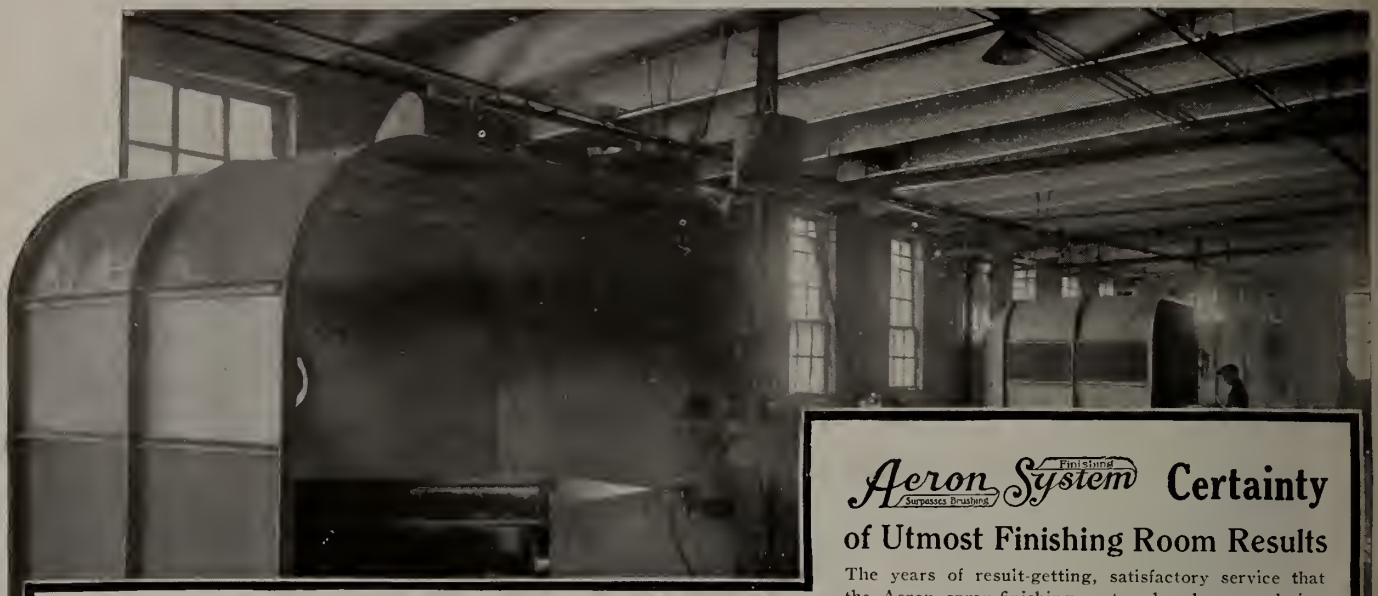
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



Aeron Finishing System — Surpasses Brushing

Certainty of Utmost Finishing Room Results

The years of result-getting, satisfactory service that the Aeron spray-finishing system has been rendering the wood and metal-working industries, gives to each new installation of this equipment an assurance of the utmost in quality, speed and economy.

No matter what type, size or grade of product you manufacture, nor with what kind of finishing material you coat it—the Aeron System undoubtedly is now being used on work of the same or similar character, and will be most certain to make it possible for you to do the highest grade of work at a big reduction in costs.

Operation Facts One Aeron operator easily does the work of 2 to 6 or more hand brushers—governed by nature of work.
A cleaner and more uniform coating of every material is applied—there are no brush marks, thin spots or fatty edges.
Work is made absolutely healthful and safe—all fumes are completely removed.
Equipment is kept in the best working condition at practically no cost.
The Aeron System is sold on a strictly guaranteed basis, and every installation followed up by a competent service organization.

Write and let us send on more definite particulars.

THE DeVILBISS MFG. Co. 1318 Dorr St., Toledo, Ohio, U.S.A.

High Grade Stains and Fillers

In our Stains you will find the highest possible color values—they are positive—they are permanent. Manufactured in quantities from the best quality raw materials.

Wood Fillers also that have been tested under the most difficult of varying circumstances and found satisfactory.

Eliminate trouble in your finishing department by using these tested materials.

Veneers and Panels

Have You Had These Troubles?

Difficulties Met with and How they were Overcome—Uneven Drying Floor Caused Considerable Worry Until Discovered

By Superintendent

Volumes have been written on veneering, and probably all the difficulties mentioned in this article have been dealt with and methods of overcoming them explained in a much better way than I can do. As quite recently I have noticed furniture on sale in some of the best stores in our larger cities that showed slight defects in the veneering, it may not do any harm to touch on a few of the common troubles in making veneered goods, with some suggestions for overcoming them.

In the first place perhaps the commonest trouble is that the veneer joints are apt to show. This is most noticeable, generaly, in a large horizontal surface such as a desk top, where the light has a chance to show up even a slight defect. The same defect in a vertical face would perhaps not be noticed, but at the same time should not be there. The defect I refer to is not a bad joint but a very slight hair lineline crack in the varnish directly over the veneer joint. This defect is more common than some manufacturers realize and frequently does not make itself visible for some weeks after the goods are made and shipped.

Stock Not Properly Equalized

This fault is caused, generally, by the fact that all the moisture which had been absorbed by the veneers when the glue was applied, had not been eliminated before the varnish was put on, and sometimes by the fact that the veneer itself was not sufficiently dry when the veneering was done. Whatever the reason, I think it may safely be said that in all cases of this kind there has been a slight shrinking of the veneer itself and as the only place that there can be any actual movement is at the joint (on account of the veneer being held tight in place by the glue) it shrinks sufficiently, where it can—that is at the joint—to show the hair-line crack in the varnish. To overcome this, if you use animal glue, do not use a glue that takes too much water, make sure that your veneer is bone dry before being glued, and last and most important dry the veneered work thoroughly before finishing. A good plan is to put the veneered work through a special drying chamber before proceeding with succeeding operations.

Another common difficulty is blistering, or loose spots in the veneer. This is not so often noticed on the sales floors, as blistered goods do not often get that far but most factories doing veneered work have had this trouble "in process" from time to time. There are various causes for these blisters. Sometimes it is poor glue or with animal glue, glue of wrong temperature, sometimes uneven pressure in the presses and occasionally by the core stock or crossbanding being of such a hard non-absorbent material that the glue will not hold. A combination of two or more of these factors will sometimes accur. The remedies are simple and suggest themselves if the cause is located. First test your glue for strength, second, make sure that it is not overheated—if animal glue. Third, be sure that it is evenly spread and that pressure in the presses is even, and finally use suitable core-stock and crossbanding. I suppose at the present the last sentence should be qualified by saying: "If you can get it."

Care and Thoroughness Essential

One of the most essential characteristics in a veneer man is that he shall be careful and thorough, and it will be noticed that the above suggested remedies are little else than a suggestion that your head veneer man be careful in his details, because he is certainly aware of these remedies if he knows his business at all.

I will mention now a trouble that a certain factory had some years ago with part of its veneer work, one which gave a good deal of worry for a considerable time. The remedy eventually formed was so simple that it certainly should have been discovered earlier, but as a matter of fact the trouble had been cropping up occasionally for months before it was finally rectified.

Overcoming Warping in Desk Tops

The factory in question was making a number of tilting typewriter desks and the tops of these were of five ply material with quartered oak face. The tops of these desks of course had to be cut for the typewriter opening, and it was found that in a certain percentage of each batch the tilting top was inclined to warp. The greatest care was then taken with the materials, the glue, the drying and in fact it was thought with every detail of the work. Still the warping persisted. The manager noticed that when the tilting top of the typewriter desk was closed, it was nearly always the same corner that was too high, in other work the tops had a tendency to warp in the same way. It occurred to him at last that perhaps the warping was done in the drying, and on investigation it was found that the floor on which these tops were dried was slightly uneven and that the tops conforming to the shape of this floor in drying, had a tendency to remain that way when dried.

The curve being located, the remedy was simple, and thereafter the tops were dried on a perfectly level place and held in a level position when drying and the difficulty vanished.

There are difficulties in selecting, matching, jointing, taping, laying, and drying veneers, but the great remedy for all is a mixture of care, experience and common sense.

Matching Veneers for Color Most Important

North Exposure Best Light for this Work—Saves Considerable Time in Finishing Operations—Strong Glare Deceiving—Bizarre Figures Not Desirable

By R. N .Y.

The proper matching and shading of face veneers is becoming one of the prime essentials of first-class veneering. Time was not so long ago when very little, if any, consideration was given to the matching of veneers. With the great demand for built up panels in the construction of phonographic cases, however, it has become more apparent that the veneers entering into the construction of the cases must be properly matched for shade, as well as figure, if the full beauty of the fine stock is to be brought out in the finished article. One mismatched piece of quartered oak or other face veneer, has often spoiled the beauty of many a high-priced phonograph case.

The matching of the veneers, as far as figure is concerned, is not such a difficult task. Where skill is required is where it is necessary to match veneers, both for the figure and for color. I know of men who are experts in the matching of veneers, as far as figure or grain are concerned, but when they are put at color matching—harmonizing the veneers in such a manner that they will appear all one color when stained with a light stain—they are complete failures.

Good Light Prime Essential

This may not be due to any carelessness or neglect on their part, for undoubtedly they are doing their best. The chief reason for such poor results lies in the fact that the prime essentials in properly matching veneers for color, are understood by only a small number of veneer matchers.

A delusion that prevails among veneer workers is that in order to do a good matching job, it should be done in a bright location on the sunny side of the plant. This is the gravest error that can be made. It is the very reason that much of the veneer matched in a bright sunlight proves away off for color, and will often show up decidedly shaded when the stain is applied.

Experiments have shown that the most uniform and reliable natural light for matching for color is the north sky light. Veneers that are matched on the north side of the plant have proven invariably better matched than when the work was done in any other light.

Plenty of Light Required

The writer does not mean to infer by this that the matching of all veneers should be done in some dark, forsaken corner on the north side of the building. On the contrary, if the matching of veneers for shade is necessary, the most satisfactory results will be obtained when the work is done where there is an abundance of north light exposure. This light, combined with the skill of the average veneer matcher, will produce work that is as accurate for matching in figure and shade, as is humanly possible.

It is quite true that a bright south side exposed sunny room seems a more appropriate place for the matching of veneers (and this is true especially in the winter time) than the one situated on the cold north side of the shop, yet where the requirements of the product demand that colors or shades of veneers must be evenly matched, it becomes a hard task for the most expert veneer matcher to accomplish satisfactory results in the bright, sunny side located room for matching veneers.

Colors Deceiving in Strong Glare

As a rule the veneers will look properly mached as long as they remain in that room, yet when they are glued up, and the panels pass through the different stages of finishing, it will often appear that nothing but utter carelessness on the part of the workmen can be responsible for the great contrast in the matching of the shades as they appear when stained or finished.

Many plants are so situated that matching of veneers must be done the greater part of time in artificial light. In many plants it has been contended that the bright tungsten electric light would make the ideal light for this purpose. It is quite true that the same does prove quite satisfactory where matching of veneers is done only as regards the grain or figure. However, where matching for shade must be done, the bright electric light is not to be recommended. The ideal artificial light to select is the one which is capable of absorbing the excess of color shadows down to the proportion of daylight, so that the light produced will be as near a duplicate of color blending properties of natural daylight as possible, both in composition and effect.

It has been shown that the Welsbach mantle gas light comes the nearest of all artificial lights to daylight. It is true that the electricity and acetylene give a brighter light. These have the same effect in matching veneers for color as the effects of bright sunlight have. The Welsbach gaslight maintains a uniformity in color of light thrown off, and its rays and reflections of color composition are a much nearer approach to natural daylight than any other artificial means of light production.

Judging Value of Figure

When is a piece of face veneer properly matched? This is a question to which it is difficult to give a direct answer. The opinions or tastes of different individuals are so varied. The creation of a certain figure or grain out of a combination of several pieces of veneer, may strike one person as pretty, while another would look upon it with aversion. In matching for grain effects only the combination of grains or figure effects should be studied. The character of a combination of figures can often be materially influenced by a predominance of certain grains.

What mode or pattern of figured matched veneer is the most popular with the public? In this regard it would be well to advise the veneer matcher to steer clear of all fantastic designs or creations. Designs leaning towards natural everyday effects, such as flowers, mountain ridges and gullies, or similar creations, are in greatest demand and will always prove pleasing to the eye of the public. The veneer matcher, who takes nature as his guide, will always be capable of producing a pleasing lot of face veneers without regard to the predominance of the figure in the same previous to being matched.

CONTINUOUS SERVICE FOR TWO GENERATIONS

One of our principal competitors recently paid us the compliment of the voluntary statement that our position in the hardwood and veneer trade was the result of never varying from the traditions on which our organization was founded.

Northern Grown Oak

Fifty-two years of making and finishing the right kind of product has resulted in service of that character becoming not only a trade asset and the basis of a National reputation, but a veritable business habit. Our endeavor has for so long been to never deviate from the standards of 100 per cent. excellence as laid down by those who founded this business, that it is practically a matter of impossibility for us to vary the quality of our goods without a complete reorganization over to a high-speed, quantity basis.

American Beauty Walnut

It is recognized by the discriminating trade that our service incorporates not only goods of the highest possible excellence, but thorough understanding of the customer's requirements in order that his share of our always choice selection of goods may be precisely what he prefers.

Our knowledge of customers. needs and our ability to exactly meet those needs, recommend our service to you as a careful and experienced buyer.

Estimating Red Gum Veneer By Weight

Outlines Advantages of Estimating Quantity Red Gum Veneer by Weight—Fair to Both Buyer and Seller

By Armin Elmendorf, Haskelite Mfg. Corp., Chicago, Ill.*

The following discussion outlines a plan for the purchase of red gum veneer, log run grade or sheet stock, on the basis of weight:

It is believed that the method proposed for measuring the number of square feet of red gum veneer in any particular shipment on the basis of weight is accurate, economical, and a justice to both buyer and seller.

It is proposed that veneer shall be bought and sold by the square foot, as heretofore, but that the square feet shall be estimated by weight in a manner similar to the estimation of the number of bushels of grain by weight. The latter procedure has been practiced by the grain industry for some time, and its advantages are quite generally conceded.

The proposal is a natural outgrowth of a practice which was adopted by the Haskelite Manufacturing Corporation in the fall of 1918 to check up losses in veneer during manufacture. The material was weighted as it passed from one department to another in the process of manufacture, and the losses in each department were determined. This naturally led to the weighing of veneer on its receipt from the mills, and then to the habit of estimating the square feet in any shipment on the weigh basis.

Has Proved Satisfactory

Our experience in estimating quantities of veneer by weight has proved so satisfactory that we have thought it our duty to the veneer industry to offer for general use a method which we believe to be more equitable, accurate and economical than that now in use.

A tentative table of weights has been prepared for general use in connection with red gum veneer. This table is called tentative because it has been necessary to base the table upon certain assumptions, and before such a table is finally adopted for general use it may be desirable to make changes in the assumptions upon which it is based. A change in assumptions will make slight alterations in the table. This table gives the weight in pounds per thousand square feet of veneer for each common thickness and for any ordinary moisture content.

We will say that one grade of veneer is to be made for shipment. Assuming that the veneer is of proper thickness and that the length is satisfactory, we must know two facts: one, the net weight of the veneer in the crate; and, two, the average moisture content of the veneer crated. The net weight of the veneer will commonly be obtained by weighing, first, the empty crate, and then the crate when packed with veneer; the difference is the net weight wanted.

Moisture Content Determined

The determination of the moisture content is already practiced by many manufacturers, particularly as a check against their drying ovens. The process is comparatively simple and should not be regarded as a hardship by any mill. One selects one or two fair samples of the veneer, possibly full length strips, marking the number of the crate thereon. He weighs these samples to an accuracy of ½ per cent. or a little better, and places them in an oven that is maintained at about the boiling temperature of water for about twenty-four hours, after which he weighs them a second time. The loss in weight expressed in per cent. of the dry weight is the moisture content.

The samples that are used in determining the moisture content need not be injured in the process, and may be included in another shipment of veneer of the same thickness.

Having determined the per cent. of moisture in the crate, one refers to the table and finds the number of pounds of veneer required to make 1,000 square feet at this moisture content. He divides the number of pounds of veneer contained by the crate by the number of pounds per thousand obtained from the table and in this way finds the number of square feet in the crate.

If one is making up several crates of the same thickness of veneer at the same time, it will be sufficient if all of the samples that are used for determining the moisture content are treated as a unit giving a single determination for the entire group.

Purchaser Can Check Up

When the veneer is received by the purchaser the procedure will be quite similar to that described above. Each crate will be weighed as received; a sample or two will be removed and marked for moisture determination; the empty crate will be weighed or its weight estimated. The moisture content may now be different from that at which the veneer was shipped, but if the moisture content is different the net weight will also be different, the difference being simply the weight of the water added or subtracted from the wood. The number of square feet will in no way be changed and the table will give the same result in square feet. It is important that the latter point be clearly understood.

It is well known that some gum trees show heavier wood than others. Tests have shown that the heavy wood is stronger than the light wood, the strength being almost directly proportional to the weight. The method in use at present for estimating quantities of veneer counts heavy wood and light wood on exactly the same basis. The proposed method pays for wood directly in proportion to its strength. The panel maker should be willing to pay a premium for superior material, and the veneer cutter is entitled to such premium.

Undersized Stock at Disadvantage

In the endeavor to make the best possible panels for engineering uses, it is essential that veneers that are supposed to be of a given thickness in panels shall actually have that particular thickness. We have recently had so much difficulty in obtaining deliveries of veneer of the full thickness that in many cases it has been necessary for us to plane these veneers down to the next usable size.

It may be noted that the present method of de-

*Extracts from address before Commercial Rotary Veneer Department of the American Hardwood Manufacturers' Association.

termining quantities places a premium on under-sized veneers. The labor cost per thousand square feet is no more on veneer that is somewhat thin than upon veneer that is of full thickness, but when the veneer is cut under size one gets more square feet from the same log.

It is not claimed that good makers of veneer deliberately intend to furnish thin veneer in order to get more square feet from the same log; it is claimed simply that the present method of estimating quantities gives the unscrupulous man an unfair advantage over the straightforward manufacturer, which condition it is desirable to eliminate.

Since the proposed method of estimating quantities is based upon weght at a particular condition of moisture, and since this weight is proportional to the thickness, it is evident that the method proposed does not place a premium on thin veneer.

More Accurate Than Measuring

The specifications for veneer are not at all definite as to the moisture content the veneer should have when it is measured for quantity. If a mill ships rotary cut gum veneer at 20 per cent. moisture content, while another ships it at 10 per cent. moisture, the first mill is delivering about 5 per cent. less veneer than the second per thousand square feet measure. This is due to the fact that veneer shrinks about 5 per cent. in width when the moisture content is reduced from 20 per cent. to 10 per cent. Here again the manufacturer who has been shipping dry material, that is, veneer having a moisture content less than 10 per cent., is not receiving full benefit for the work he does.

The proposed method of estimating quantities gives the same number of square feet in a given shipment, whatever may be the moisture content.

It is our impression that the proposed methods of estimating quantinties is thoroughly practical. It eliminates all measurements with tape; it is equitable both to the buyer and to the seller of veneer; it will save money to both parties to a like extent; it will place a premium on high grade stock; it will eliminate most of the opportunities of thinly cut veneer in even competition with that which is carefully cut; it tends to eliminate a part of the inequality in drying; it will eliminate many sources of error, and it will enable any shipment to be estimated as practically the same quantity of veneer, both by the shipper and by the purchaser.

Standardization of Rotary Veneers

By R. E. Becker.

One of the main follies and causes of delay in completing orders for rotary cut gum and poplar veneers are the many different thicknesses asked for.

If the furniture and piano manufacturers would condense their many thicknesses to three thin sizes, such as 1/28, 1/20 and 1/16 for cross bandings and face stock, and adopt also only three thicknesses, such as 1/8, 3/16 and 1/4, for core stock and drawer bottoms, they would have fifty veneer mills bidding for their trade where there are five now catering for odd sizes.

The furniture manufacturers especially have been pampered many years for their special desires and freak notions of designers, that now when no such stock can be had they blame the mill men for profiteering and delays, when the real causes are the many special thicknesses asked for, are an impossibility for a mill to keep up with.

Every veneer mill is confronted with such oddities as 1/11, 1/13, 13/64, 1/7, 1/6, 1/9, 5/32 and 7/32 thickness, because of some certain groove or angle that they want to fit into.

By adopting three thin sizes, 1/28, 1/20, 1/16, and three thick, 1/8, 3/16 and 1/4, would put all mills on a competitive basis, the same as lumber, and no overruns or left-over stock lots offered for close-cuts which demoralize the trade.

The standardization of six thicknesses would save a vast amount of detail and saving of storage room among the veneer mills and furniture factories.

I suggest that this question be taken up by the different trade organizations and encouraged by the veneer manufacturers to bring about a clearer understanding between the veneer manufacturers and woodworkers.

Veneer Construction for Pleasure Boats

Considerable veneer was used during the war in the British navy division of airplane work. It is safe to say, too, that there will still be a fair share of seaplane work calling for veneer. What looks like the big field of possibiities in this connection, though, is in the making of light pleasure boats. Already there has been enough experimental work in the use of plywood in small-boat making to demonstrate something of its possibilities. During the next few years we may expect quite an active time in the light pleasure craft industry, and this should furnish a very fruitful and widening field for the exploitation of veneer products.

Veneer Plant Nearing Completion

The modern veneer plant which is being erected at Grand Rapids, Minn., by J. J. Nartzik, Chicago, is rapidly nearing completion. Work has been held up by the non arrival of the veneer dryer, which is long overdue. When this machine is received it will not be long before the plant will be ready for operation.

Employees To Have Another Chance

The piano factory of Brimsmead and Sons, London, Eng., which had been shut down by the directors because of the alleged stalling, inefficiency and interfering tactics of its unionized employees, is to resume operation after all.

The airing of the differences between the directors and the workers in the press has had a reconciling effect. An announcement has been issued at the firm's head office, following a conference between a deputation of the workers and the directors, as follows:

"The employees stated their willingness to co-operate with the management and amicably expressed their confidence in the ability of both to achieve the desired results, and agreed that the factory be reopened for a probationary period under conditions to be mutually agreed upon between the workers and directors, and in this respect the directors expressed themselves as satisfied that the authorized statements made in the press detriment to the workers and the management were not supported by the facts."

In Line for Your Business

—with a large, attractive stock of veneers in Mahogany, American Black Walnut, Quartered Oak, Figured Quartered Gum and plain woods from which you may, if you desire, make your own selection. In our large, bright showrooms you may select directly from stock, or write, wire or phone your order, satisfaction is assured. Our service will interest; our quality will please.

Little Hope of Early Reduction

Greater Production of Lumber Sole Solution—Industry Facing Many Difficult Problems—Huge Requirements of Certain Industries

By A. E. Clark

A stirring address on "Lumbering and the lumber markets of to-day," as far as methods, production, prices and demand are concerned, was delivered before the Electric Club in Toronto by A. E. Clark, of Edward Clark & Sons, Toronto, retiring president of the Wholesale Lumber Dealers' Association.

Mr. Clark considered his subject from many standpoints, showing how the lumbermen had year after year been facing increasing costs, the extent of which the public knew but little. He dealt with various phases of the calling both present, past and prospective, and referred to the part the lumberman had played in the war. They had carried on notwithstanding the industry had, probably, given more men to the forestry and other corps than any other branch. Lumbermen were, from their experience in outdoor life, particularly well-fitted for conducting operations in the forests of France, England and Scotland.

Mr. Clark did not hold out much hope for an early reduction in the prices of lumber, which, after all, are regulated by the law of supply and demand. There is an abnormal shortage to-day, owing to the tremendous requisitions brought about by the resumption of building after a cessation of six years and the fact that new uses for wood are being found on every side. It had been expected in some quarters that the lumber manufacturers could automatically rise to the occasion and meet this unprecedented state of affairs without the slightest difficulty. This is the view held by certain persons who did not understand the nature, extent and handicap of the lumberman's work. Those who are in a position to appreciate what he is up against, realize that he is doing his level best to cope with the situation in spite of the inefficiency of labor, its restlessness and excessive demands. In the matter of greater production, co-operation and assisting the work of reconstruction, the lumberman is not shirking his duty or taking any undue advantages.

Increase Capital or Decrease Production

"The lumber reaches the market approximately two years from the time you put the money into the product. If we had a reduction to-morrow the effect would not be felt till 1922," declared Mr. Clark.

The speaker reviewed the rapidly increasing costs in production during the last five years and pointed out the many little details which actually made the lumber business a precarious one from the point of view of the investor. "We must either increase our capital or decrease our production," he said. "There was never a greater need for production; yet we cannot increase our capital because people won't invest in standing timber at 7 per cent. when there is always the possibility of it being burned down."

Referring to the present high cost of lumber, he stated that there was no commodity which had not increased far more than lumber. "It may be lost sight of that during the war while the manufacturer was straining every effort and the farmer was endeavoring to get every acre of his land under cultivation, the lumberman was not idle," he continued. "We were fully as hard hit as any other industry and now that we are returning to normal times we are called upon to fulfill unprecedented housing demands. And we have no surplus on hand, for that was eaten up in supplying war needs." The lumberman, he pointed out, had supplied tremendous quantities of stuff for army cantonments, for trench revetment, and above all for crating purposes, and, therefore, he was no more able to take care of the unprecedented demand for building materials than was the clothier to fulfill the demands made on his industry.

Labor and Transport Difficult Problem

In addition to a general shortage of labor, which had been enhanced by the war, the lumberman had to contend with a scarcity of transport. Softwood could be floated down streams, but that meant that crews had to accompany the logs and roads had to be built to carry supplies along behind them. Hardwood must either be drawn out or other means of transportation used.

Logging locomotives, he pointed out as another instance of increased costs, cost only $13,000 in 1913. Now they cost $40,000, while steel rails, which in 1911 cost $22 a ton now cost $63 a ton—when they were obtainable. Sawmill costs had increased from 600 to 900 per cent.

We have the law of supply and demand, which very largely regulates our prices," he said. "For every 1,000 feet of lumber we produce we have ten gentlemen waiting for it and naturally that increases the price. Increased production is our main issue."

What Certain Industries Require

Both Canada and the United States were being called upon to supply the housing needs of Great Britain and France and this condition only aggravates the pressing demand. In the United States in 15 principal cities permits since the war had increased 182 per cent. and building values had increased 208 per cent. In Canada 11 cities reported a 45 per cent. increase in permits and a 77.7 increase in building values.

The automobile building programme for 1920 too had increased and at present it contemplated the construction of 2,900,000 cars, a condition which meant the use of three billion feet of hardwood lumber. "Formerly," he said, "the major portion of this work was taken care of by the oak and ash producers in the Southern United States. This wood was then selling at $90 a thousand. It has now increased to $385 a thousand and the automobile manufacturer has consequently turned to the northern hardwood fields for his supply. We do not know how to take care of this demand." Gramophones used up a tremendous quantity of hardwood, as well, he said. He cited the case of one factory he had visited where ten million feet were used annually.

Don't try to wipe or oil machines while in motion; stop the machine first. It's safer.

N.B. Quality Veneer

Quality at the Very Beginning

Write for Samples and Prices

Human efficiency together with the best of modern mechanical equipment are the outstanding factors in producing N. B. Quality Veneer. Back of both, however, lies a primary quality that is the keynote of its exceptional value. This is the selected quality of the logs we use.

Our corps of trained log buyers go continually from one great log heap to another, selecting fine clear logs, which will grade up to the N. B. Quality standard.

On arrival at our mills every log is further classified, graded and marked for that particular department to which it is best fitted, whether it be sawed or sliced veneer, rotary cut veneer or into lumber. N. B. Quality is thus safeguarded through every process from log to finished product.

Information and Inquiries

You are cordially invited to make use of this department

Quantity of Pipe for Kiln

Silver Hill, March 25, 1920.

Editor "Canadian Woodworker":—

I intend to follow your suggestion and put the pipes below the rails. The kiln is 8′ x 20′ x 8′. Could you tell me how many feet of 1″ pipe I would have to instal to heat the kiln, using exhaust steam from a 10 h.p. engine, augmented by a certain amount of live steam.. Where can I secure suitable instruments, such as wet and dry bulb hygrometer.

Sincerely yours,

Jas. Gilkes.

The quantity of feet required would, to a certain extent, depend on how you lay the pipes. You need at least 850 lineal feet, and if you use headers with the holes 1½ in. centres you might lay 1000 feet. The former figure should enable you to maintain a temperature of from 165° to 175°. The instruments may be secured from the makers of dry kiln equipment advertising in the Canadian Woodworker.

Construction of Small Dry Kiln

Replying to an inquiry in the March Woodworker regarding the construction of a small dry kiln, I would advise the use of the moist air system for this purpose. I would not build the kiln too small, although their requirements are small at present they are bound to grow, and nearly every woodworking firm finds themselves short of this same drying capacity. Besides it is better to have ample room so that it will not be necessary to rush the drying. Better results are obtained if you can keep the temperature of a kiln at 150° instead of 200°. I would advise a kiln to hold six trucks of lumber of 3000 feet each and the building should be 42 feet long inside the curtains by 18 feet wide. If lumber was all 12 ft. long 16 ft. wood be ample width, but lots of lumber is as much as 16 ft. long and there should be room for a man to pass at each end. The room should be 10 ft. high above the rails and should have two curtains at each end about six inches apart. The heating surface should be a double coil of 1 in. pipe laid between each rail of the track with drop headers at each end, and discharge pipes from the ends of all headers at both ends of kiln to a trap, preferably a Moorehead, back to boiler trap which will return the condensation back to the boiler at a high temperature and will result in quite a saving in fuel besides keeping the coils entirely free from water. There should be a double coil of 24 pipes in a row two rows deep between each track. That would make 96 pipes in all and should extend to within two feet of each end of the kiln. In regard to the ventilation, on page 82 of the December Woodworker will be found a cut and description of the best method of ventilating a dry kiln. It is the method employed by a number of the best makes of kilns. If these air ducts are placed as described up through the wall of the kiln letting the frsh air in at the bottom of the kiln under the pipes there should be no trouble in getting good results.—G. H. H.

Securing a Fumed Finish

Toronto, April 2, 1920.

Editor "Canadian Woodworker":—

We were very much interested in the article on fumed oak, which appeared in the March "Canadian Woodworker." We manufacture phonographs as a small way and was wondering if you would favor us with a few suggestions for securing a fumed finish.

Sincerely yours,

R. H. Ralston & Son.

If you are manufacturing in a small way you may not care to go to the expense of fitting up a fuming box. In that case would suggest that you secure a good fumed oak stain from some of the finishing material manufacturers who advertise in this journal—they are all reliable firms—and use that with a shellac and wax finish. On the other hand, you could construct a small, air-tight box—it would be better if you could run a steam pipe through it—and fume by placing cabinets in the box with a dish of full-strength ammonia and leave until the desired color has been secured. There are many solutions used to hurry the fuming, but as they all tend to raise the grain it might be well, in your case, to fume on the raw wood. After the desired shade has been reached, judge the color by wetting the finger and making a mark on the wood, the tone should be equalized by touching up any light spots or streaks. The finishing coats consist of two or three applications of shellac and a coat of wax.

Address of Association

Sudbury, March 25, 1920.

Editor "Canadian Woodworker":—

Can you favor us with the name and address of the Secretary of the Wholesale Sash and Door Association of the United States, and also the name of the Canadian representative should there happen to be one.

Yours truly,

The Evans Co., Limited,

This organization is known as the Wholesale Sash and Door Association. The headquarters are in the Steger Building, Chicago, Ill., and M. F. Godfrey is secretary. We do not think that they have a representative in Canada.

Jacobean Balusters Required

A subscriber would like to get in touch with some woodworker in a position to supply about 50 oak Jacobean balusters and six newels to match. The publishers of this paper would be glad to have the names of any firms who operate spiral turning machines and who could fill this order.

High-Grade Handles Wanted

A manufacturer requiring a quantity of high-grade wooden handles, suitable for tea and coffee pots in aluminum and nickeled brass. If you are in a position to make these handles kindly communicate with the publishers of this paper.

The higher the wages paid in a mill the greater the tendency to install labor-saving machines.

You cannot make good furniture out of green lumber.

Box Shooks Wanted in Britain

A large British soap manufacturer who has been buying quantities of box shooks from Sweden is desirous of securing his requirements in Canada. The material is bought cut to accurate dimensions, being smooth sawn and usually formed of two pieces tongued, grooved, glued and smooth on side so as to take a good impression when put through the two color printing machine. The following specifications indicate some of the normal requirements of the firm:

23¼ x 13½ x 5/16 inch.
23¼ x 12 x 5/16 inch.
21⅞ x 13½ x 5/16 inch.
21⅞ x 12 x 5/16 inch.
19⅝ x 8 x 5/16 inch.
17 x 8¼ x 5/16 inch.

Boards are also purchased cut to certain lengths, but varying as regards widths. The widths would be from 4-inch upwards in steps of ½-inch and the size—

21⅞ x 5/16 inch.
17 x 5/16 inch.
13 x ⅝ inch.
15 x ⅝ inch.

All the quotations received so far from Canada have been much too high, and in order to give some idea of the prices which would have to be equalled, if not bettered, the following are the Swedish quotations on certain sizes:

23¼ in. x 13½ in. 5/16 in.—25s. 10d. per 100 pcs., f.o.b. Gothenburg, Sweden.

21⅞ in. x 13½ in. x 5/16 in.—24s. 0d per 100 pcs., f.o.b. Gothenburg, Sweden.

17 in. x 8¼ in. x 5/16 in.—21s. 3d per 100 pcs., f.o.b. Gothenburg, Sweden.

The freight from Gothenburg to England is about £6 per standard. Timber in varying widths averaging 5-inch, not tongued and grooved, lengths from 16-inch to 23¼ by 5/16-inch in thickness, average £30 per standard, f.o.b. Gothenburg, while the prices delivered to the works in Bristol average £38 10s. 0d. The kind of wood usually supplied from Sweden has been white and red fir, but the former is preferred. The timber is usually cut some months previous to shipment and air-dried. It is doubtful whether steam or kiln-dried wood could stand the damp climate of England. The boards are generally imported in bundles of 25 pieces bound by wire.

Anyone desirous of quoting on these requirements can secure the name of the enquirers by applying to the publishers of the "Canadian Woodworker."

Opportunities in Wood Toys

A report read at the annual meeting of the Toy Manufacturers' Association of the United States, held in New York, December 17th, showed an increase in volume of business from $13,000,000 in 1914 to more than $21,000,000 in 1919. This great increase is due largely to the fact that American made toys have supplanted the German product in this country.

At a recent toy exhibit held in Chicago, it was interesting to note that the majority of the most original toys were made of wood. Many of them are in the form of comical animals and birds with jointed or movable parts, most of them on rollers. Toy building material was also conspicuous. Mechanical construction outfits, formerly supplied only in stamped metal, are now being produced in sets chiefly or entirely of wooden pieces. There is almost an unlimited field. An original design attractively executed finds a ready sale and at attractive prices. Toys can be made a most attractive side line to a box factory or other wood working plant.

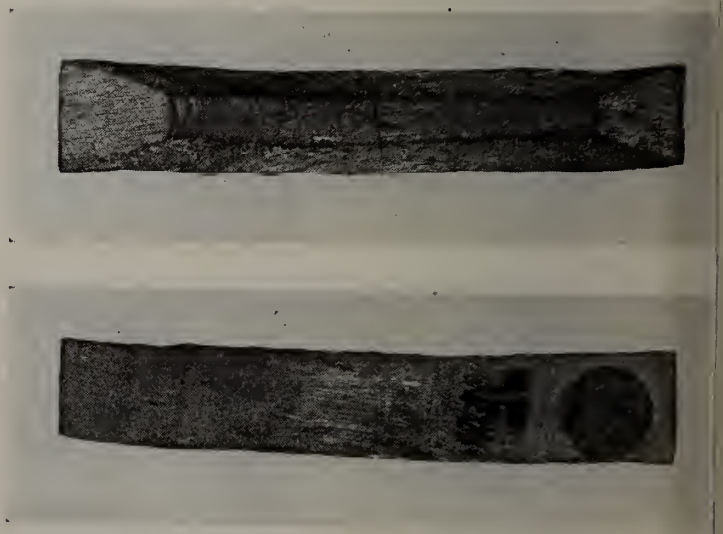
Wood Carving Losing Favor in Britain

A correspondent in an English journal bewails the decline of the British wood-carver. He says: "The machine has superseded hand-work for elementary or creap jobs; but I believe there is plenty of real ability in the country. Given the demand, at an adequate price, I do not hesitate to say that the work could be done. Grlinling Gibbons did not have to work "to a cut price"! Even so, there are few signs of a revival of the taste for good carving on the part of the public. The labor-saving crusade is all against much carving on pieces of furniture, rather than elaborate carved decorations. From the point of view of the wood-carver this is to be regretted, as it is artistically, because wood-carving is a beautiful craft and well worthy of preservation in a state of full prosperity."

Wanted—Hickory Blocks by the Million

A firm of hardware importers of London, England, who have been acting as agents for Canadian manufacturers, are receiving heavy inquiries for hickory wood shoe and boot stiffeners, bevelled, cut and steamed to curve as in sample shown below.

These stiffeners are wanted in the following dimensions: 4½-in by ⅛-inch, 15 million pieces; 4-inch



Shape of block required

by ¾-inch, 10 million pieces; 3½-inch by ⅝-inch, 10 million pieces in bags of 30,000 pieces. Any manufacturer who is interested in this business can secure the name of the firm from the publishers of the "Canadian Woodworker."

Fire prevention is the duty of every citizen.

Think safety and the doctor won't have to think of you.

You need all of your fingers and all of your toes. Be careful in the factory.

SERVICE

means giving the very best that is in you. No word has been over-played in modern advertising copy more than the word "service." In practical use the word "service" has a relative significance. The advertiser who honestly desires to live up to his advertised service, naturally has as his goal 100% satisfaction in all particulars of his dealings with his customers.

In reality, though, that man who advertises service and then gives the very best in him in his struggle to make it 100%, is giving service in the true sense even though he fall down 33% from his expectations.

Frankly, that is exactly our position to-day. Faced with a tremendous demand for our products and a woefully short supply, on top of which were heaped unheard of weather and labor difficulties, we have not hesitated to invest thousands and thousands of dollars in new mills and new logging equipment, and have spared no effort to get loaded cars out. However, the best we could do was not adequate under the conditions. We are still behind although hopeful of again getting our heads above the mud and mire that all winter has deluged southern timberlands.

At least we can say we have given the best in us and will continue to do so until our service does finally go back to approximately 100% level.

bedroom furniture. Deliveries are expected to commence the first of May. C. Hill, formerly manager of the Wiarton branch of the Canada Furniture Manufacturers, Limited, is guiding the destinies of the new company.

The Hamilton Canoe Co., Limited, Hamilton, Ont., have been incorporated to manufacture and build canoes, boats, launches and other water and ice vehicles. Capital $40,000. J. Henderson and R. Shields, both of Hamilton, Ont., are two of the incorporators.

His Master's Voice, Limited, Montreal, P. Q., were recently incorporated to manufacture and deal in gramaphones, talking machines and other musical instruments. Capital $1,500,000. W. Bain and E. H. Stewart, accountants, Toronto, Ont., are two of the incorporators.

The Ericson Marine & Aircraft, Limited, Toronto, Ont., have been incorporated to manufacture and deal in aeroplanes, hydroplanes and vehicles of all kinds. Capital stock $250,000. Among the incorporators are F. J. Hughes and L. J. Phelan, solicitors, both of Toronto.

Fire broke out in the factory of Henry Morgan & Co., Limited, Montreal, doing damage to the extent of about $1500. The fire brigade, organized among the employees, set to work to extinguish the blaze and practically had the fire out upon the arrival of the civic brigade.

The Repeatograph Co. of Canada, Limited, Montreal, P. Q., were recently incorporated to manufacture and deal in phonographs, talking machines and other musical instruments. Capital $10,000. J. J. Meagher and J. E. Conlin, of Montreal, P. Q, were two of the incorporators

O'Donnell & Morrissette, Limited, Sherbrooke, P. Q., were recently incorported to manufacture and deal in furniture, musical instruments and other wood products. Capital $99,000. J. F. O'Donnell and N. Chevalier, merchants of Sherbrooke, P. Q., are two of the incorporators.

A company known as the Dominion Wood Specialty Co., Hespeler, Ont., has been formed to manufacture hockey sticks. At present a plant is being installed which will be in operation shortly. Edward C. Salyerds, the manager, has had a wide experience in the manufacture of this product.

The Dominion Store & Office Fixture Co., Limited, Montreal, P. Q., have been granted a provincial charter to manufacture and deal in furniture, sashes, doors, and other articles of wood. Capital $10,000. Two of the incorporators are B. Shulman and S. A. Shulman, both of Montreal.

The St. Lawrence Broom & Brush Co., Montreal., P. Q., have been reorganized R. Langlois has bought out the interest of one of the partners and has put enough capital in to enable the business to be conducted on a cash basis. The output of 700 dozen a week will shortly be raised to 800 dozen.

The Toronto Woodworkers, Limited, Toronto, Ont., were recently incorporated to manufacture and deal in furniture, cabinets, musical instruments and all kinds of woodenware. Capital stock $100,000. Among the incorporators are G. H. Lovatt and A. Pickles, students-at-law, both of Toronto, Ont

The Alma Ship Building Co., Sussex, N. B., have been incorporated to manufacture and deal in ships and vessels and to take over as a going concern the shipbuilding business of T. White & Son, Ltd., Alma, N. B. Capital $24,000. W. G. White and H. H. Reid, of Sussex, N. B., are two of the incorporators.

The Hamilton Canoe Co., Limited, Hamilton, Ont., has taken over the manufacturing end of the business conducted by H. L. Bastien Co. This puts the Hamilton Canoe Co. in a position to build or repair any kind of boat. A large staff of experienced boat builders is employed and all work is going through promptly.

Haley & Sons, Limited, St. Steven, N. B., have been incorporated to conduct a general woodworking and lumber business and to take over as a going concern the business carried on under the name of Haley & Son. Capital $299,000. H. E. Haley, J. L. Haley and H. R. Haley, of St. Steven, are among the incorporators

The Malcolm & Hill, Limited, Kitchener, Ont., have been incorporated to manufacture and deal in furniture and all kinds of upholstering goods and to acquire and carry on the business of the D. Hibner Furniture Co., Kitchener, Ont. Capital $600,000. G. H. Sproat, and C. H. Kemp, of Toronto, Ont., are two of the incorporators

Carriage Factories, Limited, Orillia, Ont., have disposed of the Heney carriage factory, Montreal, to Fry's, the well known English manufacturers of chocolate. The truck bodies and winter automobile tops which were made in this Montreal plant will henceforth be maunfactured in Orillia. Part of the Fisher plant will be used for this purpose.

C. H. Cudemore, a well known British lumberman, recently arrived in Vancouver in the interests of the Twentieth Century Building Co. This company has been formed in Britain for the purpose of importing knock down houses from B. C. Mr. Cudmore is of the opinion that this trade would reach large proportions in the very near future.

The activities of John Arbuthnot, inventor of the demountable lumber carrying ship, have been transferred from Victoria, B. C., to Seattle, Wash. Mr. Arbothnot recently stated that the actual construction of one of these vessels would be commenced in Seattle in the very near future. This ship will b constructed of timber for the British market.

The planing mill of C. B. Williams Co., Toronto, was recently destroyed by fire. The loss runs from $20,000 to $25,000. The lumber stored in the yard was badly scorched by the flames. The W. A. Moore Co., manufacturers of mentels who occupied a part of this building suffered a loss of $3,500, which was covered to the extent of $1,000 by insurance.

The Gerard Wire Tying Machine Co., Limited, Hamilton, Ont., manufacturers of wire tying and baling equipment, who were incorporated under a Dominion charter, have been granted a provincial license to carry on business in Ontario, provided the capital used does not exceed $60,000. W. S. Bauer has been appointed vice-president and general manager.

The Pellerin Pelton Music Co., Limited, Ottawa, Ont., have been authorized by supplementary letters patent to take over the firm or Arthur Pellerin Co., of Ottawa, and to manufacture and deal in musical instruments, home and office furniture. Capital stock $100,000. A. Pellerin and C. W. Pelton, music merchants Ottawa, Ont., are two of the incorporators.

The plant of the Chesley Chair Co., Limited, Chesley, Ont., was recently damaged by fire. The blaze broke out in the finishing room, where benzine and other inflammable materials are kept, and made considerable headway before the firemen were on the scene. The loss amounts to about $10,000. The operation of the plant was not seriously interfered with.

Moirs Limited, Halifax, N. S., are rebuilding the sawmill and box factory at Bedford, N. S., which was recently destroyed by fire. The new building, which is 160 x 60, two stories, with an L at one end, to give sufficient length for sawing logs, is the same size as the one destroyed. It is the intention of the company to equip this plant with the most up-to-date labor-saving machinery.

The Alfred McDonald Lumber Co., Peterboro, Ont., have just completed a new box factory. In view of the shortage of houses and the increased demand for building materials the McDonald Lumber Co. felt it was necessary to prepare for a busy season. The erection of the new box factory relieves the congestion in the sash and door plant, as formerly the boxes were manufactured in the same plant.

The A. R. Williams Machinery Co., Toronto, dealers in woodworking machinery and supplies, have quite a contract on their hands. They recently disposed of a large munitions plant in Halifax, N. S., to a firm in Hamilton, Ont., and undertook to take down the building, carry the material to Hamilton and erect it there, in consideration of a single cash sum to be paid when the structure is completed in Hamilton.

The Dominion Organ & Piano Co., Ltd., Bowmanville, Ont., celebrated their 50th anniversary this year, the industry having been established in Bowmanville in 1870. J. W. Alexander, the president and managing director, has been in control since 1894, and J. B. Mitchell, the superintendent, has put in 40 years with the company. The Dominion line, produced by this firm, is very favorable known to the musical trade.

Planing mill equipment consisting of circular re-saws, planers, rip-saws, stickers and other woodworking machines is being installed in the old planing mill of the dismantled British Canadian Lumber Co's. plant at Queensboro, B. C. This plant will be used to manufacture the 4,000,000 ft. of timber which is to be saved from the platforms of the yard area of the mill. A 75 h.p. motor will furnish the necessary power. G. O. Buchanan is in charge of this work.

The Rubberset Company of Newark, N. J., have purchased from the A. R. Williams Machinery Co., of Toronto,

Limited, a vacant factory at Gravenhurst, Ont., and will instal about $40,000 worth of machinery for making wooden handles for their line of brushes. It is anticipated that this plant will make the handles both for the Canadian branch located in Toronto and for the parent organization in Newark, N. J. The work will be rushed to completion and the new plant will be in operation at an early date.

The Canadian National Railways have placed orders for equipment to the value of $25,000,000. This equipment includes both locomotives and rolling stock. The following firms have received a part of this business: The Canadian car & Foundry Co., Montreal, 18 sleeping cars, 12 dining, 20 baggage, 100 box, 600 refrigerator, 80 cabooses; the Eastern Car Co., Trenton, N. S., 500 box, 1150 coal cars and 6 snow plows; the Preston Car & Coach Co., Preston, Ont., 20 cabooses; and the Hart-Otis Car Co., Montreal, 250 ballast cars.

The Langslow Fowler Co., Rochester, N. Y., have decided to erect a Canadian plant at Cobourg, Ont. A large factory will be erected and equipped at a cost of $150,000, on the site formerly occupied by the Crossen Car shops. The equipment of this plant will be up-to-date and modern in every respect. About seventy-five hands will be employed at the start and it is anticipated that this number will be doubled inside of two years. The town of Cobourg is making a loan of $50,000 which is to be repaid with interest by yearly payments Exemption from taxation, except school taxes and local improvements, has been granted for a period of ten years.

Personal

Edward Clark, of Edward Clark & Sons, lumber dealers, Toronto, has returned home from a very enjoyable trip to southern California.

D. M. Wright, managing director of the McLagan Furniture Co., Stratford, Ont., recently returned after spending a few weeks in Denver, Colorado.

Robert Fulton recently passed away in Toronto. Mr. Fulton, who was 70 years old, was engaged in the carriage manufacturing business for the greater part of his life.

S. Pettit, of Delaney & Pettit, Toronto, Ont., manufacturers and dealers in curled hair, glue, sand paper and other products, together with Mrs. Pettit are enjoying a short holiday in the south.

The sympathy of many friends will go out to N. G. Gunter, vice-president of Murray & Gregory, Ltd., St. John, N. B., in the loss of his wife, who recently passed away from pneumonia after a short illness.

Frank X. McDonagh, son of R. McDonagh, of Hart & McDonagh, wholesale lumber dealers, Toronto, who recently returned from overseas, has taken a position with the above-mentioned firm. Mr. McDonagh has been overseas since 1915.

H. B. Smith, Owen Sound, Ont., president of the North American Furniture Co., Limited, Owen Sound, is taking up his residence in Toronto. Mr. Smith also holds an official position with the Northern Navigation Co., and the Canada Steamships Co.

D. C. Baird, St. Mary's, Ont., was recently elected a director of the Stratford branch of the Ontario Retail Lumber Dealers' Association. Mr. Baird operates a planing mill and box factory at St. Mary's and in this connection conducts an up to date lumber yard.

John P. Waters has recently been appointed to a position on the buying and inspecting staff of Hart & McDonagh, wholesale lumber dealers, Toronto. Mr. Waters has had a wide experience in the lumber game, having a practical acquaintance with lumber from the stump to the finished product.

George A. Otto has succeeded his father, George H. Otto, as superintendent of the stain and filler department of the Standard Paint & Varnish Co., Windsor, Ont. Mr. Otto is favorably known to the American trade and brings to Canada mature knowledge and experience as a practical manufacturer and wood finished.

A. E. Clark, of Edward Clark & Sons, wholesale lumber dealers, Toronto, who has been confined to his house for the past few weeks, is again at his desk. Mr. Clark was recently elected one of the trustees of the National Wholesale Lumber Dealers' Association of New York, and is also a director of the National Hardwood Lumber Association, of Chicago.

Large Building Program

The Carborundum Company of Niagara Falls, N.Y., is to spend approximately a half a million dollars in extending and improving its mammoth plant at Niagara Falls and its two big furnace plants, one at Niagara Falls, Ont., and the other at Shawinigan Falls, Quebec.

The big building plan includes a three-storey addition to the Paper and Cloth plant at Niagara Falls in which are manufactured Carborundum Paper and Cloth, Carborundum Brand Garnet Paper and Cloth, and Aloxite Cloth. This addition, which has just been recently finished, is 432 feet long and 81 feet wide and will provide greater facilities for the storing and curing of all Carborundum, Garnet and Aloxite paper and cloth products, and for the extension of the rubber bonded wheel department.

Another addition, just completed, will extend one of the wheel making and kiln departments, the new building being two storeys high, 96 feet long and 64 feet wide. Both of these new structures are of concrete and are of the most modern type.

Other big extensions and improvements have been planned and work will be started immediately. These plans call for additions to the crushing departments and other improvements at the furnace plant at Niagara Falls, Ont., where the abrasive Aloxite is made and at Shawnigan Falls, Quebec, where is located an extensive Carborundum furnace plant. Besides these building operations the program calls for the extension of at least fourteen different departments at the big Niagara Falls, N.Y. plant of The Carborundum Company.

With the expenditure of a half a million dollars in improving its manufacturing facilities The Carborundum Company will be in a better position than ever before to meet the ever growing demand for its abrasive products.

Conservation of Forest Wealth

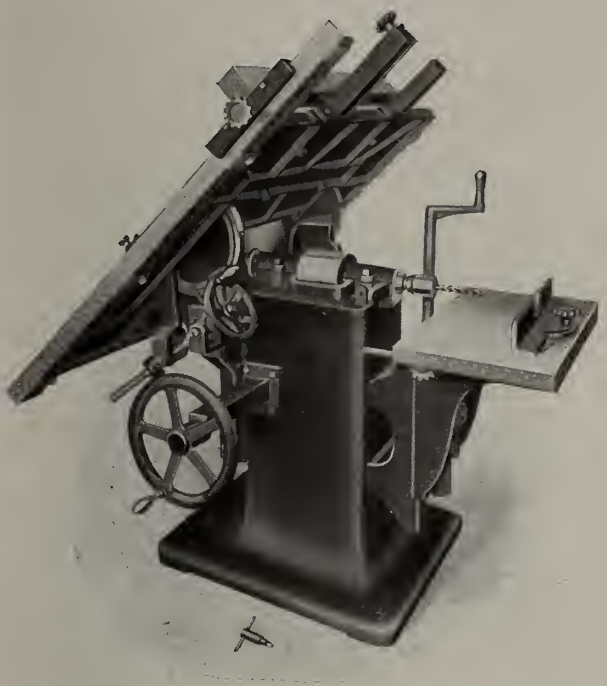
Canada has much land too poor to grow farm crops but just suited to the growing of forest trees. If this land is kept in forest it will help our farmers, manufacturers, merchants, carriers, and workingmen. But if the forest is destroyed, the land will become a barren desert, streams will dry up, and business and industry will be injured. The chief foe of our forests is fire. Most fires are caused by carelessness. Therefore, be careful with fire.

Living forests provide us with wood material of all kinds for our homes and industries, but burned forests provide no lumber for the saw-mill, no work for the workingman, no business for the merchant, and no freight for the railway or steamship. BE CAREFUL WITH FIRE.

Change in Name of Organization

The Parlor and Library Table Manufacturers met in Chicago recently and voted to change the name of their association to the Association of Living Room Table Manufacturers. Thirty-one joined under the new organization. Mr. M. Wulpi will conduct the work as commissioner.

An Excellent Machine for Furniture and Cabinet Work



The "Famous" No. 16 Variety Saw Bench with boring and mortising attachment will do much to increase your output in your furniture and cabinet shops. Accuracy is a main factor in its operation, while the roughest class of work is handled with the same degree of efficiency.

Write us for further information regarding the "Famous" No. 16 Variety Saw Bench and many other machines that you may need and are included in our complete line of woodworking machinery.

Selling Hardwood Flooring

When the average purchaser asks the price of flooring, in reality he wants to know the cost in dollars and cents of enough flooring to cover a certain room.

The hardwood flooring man usually quotes $175.00 or some such price, which sounds like a lot of money, and the prospective purchaser doesn't know whether he means $175.00 for the floor. $175.00 per hundred, or $175.00 per thousand.

Always use the smallest units of price and make it easy for the customer to understand. If you are selling 2½ in. face hardwood flooring at $175.00 per thousand feet, quote $17.50 per hundred feet, or 27 cents a square foot for the space to be covered (which allows one-third for matching) or find out the size of the room and quote total price for the amount required.

In this manner you can quote the price and avoid any misunderstanding, without conveying the idea of a high price.

For houses already built talk ⅜-in. hardwood flooring. Remember it can be laid right on top of the old floor without removing casing and base. Show the buyer the advantages of having a ⅜-in. hardwood floor in the kitchen instead of some kind of floor covering. You will be able to sell many an order in this way.

Following are some of the places where you can sell hardwood floors: Store buildings, public buildings, factories, warehouses, churches, schools, garages, and other buildings. Hardwood floors withstand the heaviest kind of traffic, and they are comfortable to work on. They do not absorb dirt or moisture, and they are sanitary and easily cleaned. Follow up the big building jobs and the results will surprise you.

The Advantages of Solid Grease Lubrication

Lubrication with oil has always been open to the objection that it gives the machinery a more or less dirty and untidy appearance. This objection has lost but little of its force, notwithstanding the improved oil cans which have been introduced. The fact remains that the use of some kind of oil can is necessary and, however conscientious an attendant may be, some waste is inevitable. Then, again, oil drips from the bearings, soiling machinery, belts, walls, floor, etc., and in many cases, also goods, as in weaving mills, dye-works, laundries, carpet and paper factories, etc. Other well-known additional sources of waste and dirt are the upsetting and leakage of vessels containing oil, and overfilling of lubricators. Moreover, no attempt is made to deny that serious injury is caused to the various prats of the machinery by the resinous deposit of fatty oils. A further objection (and that one of the strongest) to the use of oil is its inflammability and the consequent risk of fire. To this cause the destruction of many factories has been traced.

Moreover, oil is very susceptible to changes of temperature. It being thus more or less liquid, according to the season of the year, its use requires unceasing attention, especially in the case of oil lubricators acting by means of a wick, where frequent filling is required according to the nature of the wick (linen or cotton) and the viscosity of the oil.

Solid lubricants are, on the countrary, non-inflammable (in the technical acceptance of the term), and are absolutely uninfluenced by climatic changes. On the one hand they do not ignite at an extremely high temperature, and, on the other, their freezing point is lower than 119 deg. below freezing point (—87 deg. F.). Their use in a good lubricator confers the great boon of simple, clean and systematic lubrication of every part of the machinery. Bearings difficult of access can be lubricated from positions within easy reach by means of tubes, to the end of which a lubricator is fixed, there being no difficulty in forcing the grease through such tubes. The soiling of belts, floors, etc., through dripping is impossible, and the grease is not thrown about by centrifugal force.

The employment of this system means also, in almost every instance, a more simple construction of the machinery, and so great is the economy of lubricating material required (11 to 16 lbs. of solid being equal to 1 cwt. of liquid oil), that the reduction of expenditure in this direction is very considerable.

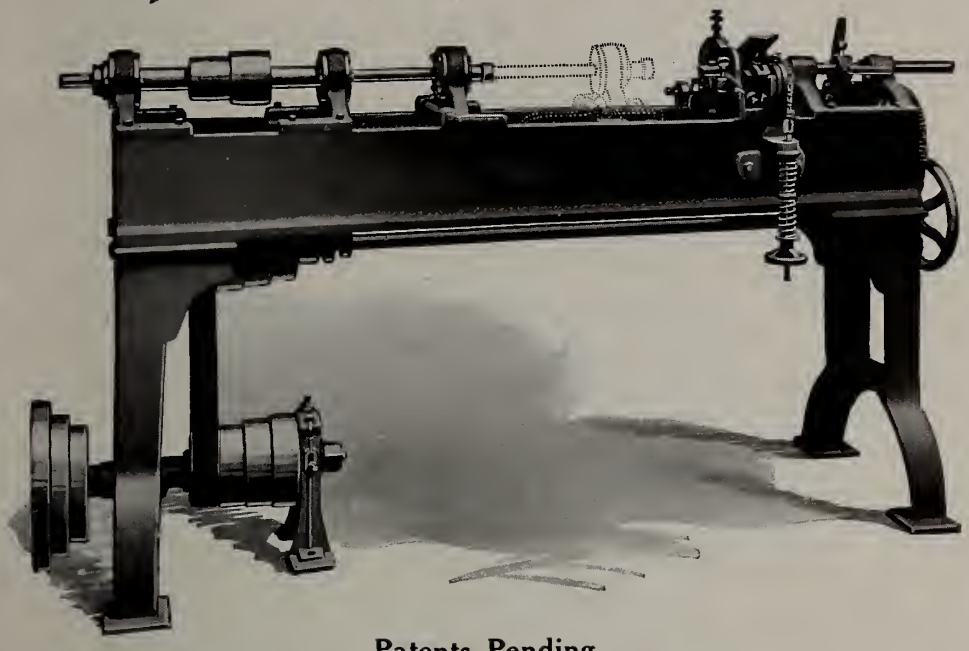
A Variety Turning Machine Such as You've Long Felt the Need of

What wouldn't you give for a variety turning machine in your plant—or several of them for that matter—so designed that all heating and mandrel troubles are eliminated; all friction on the wood, after it has been turned round with the roughing knife, done away with; in fact, all troubles overcome which retard operation? Such a machine is here—the new C. W. Smith.

S.K.F. Self Aligning Ball Bearings



Automatic Self-feeding Variety Turning Lathe

It is the result of many years' experience in the operation, development and manufacture of wood turning machines, and now constitutes a great forward step in this class of machinery.

The feeding device is so arranged that the feed can be changed by simply moving the belts from one cone to another, covering a range of 5 strokes to the minute, from 15 to 70.

Patents Pending

The swinging cutterhead moves in all directions as well as a circular motion, thus enabling the operator to set knives where they cut the wood at all times.

Cutters are made up 7-in. long, without slots, and will turn ten times as many pieces as slotted cutters and do the work much better.

All kinds of plain and fancy work can be turned, from the smallest item up to 1¾-in. diameter and 7-in. long, in all kinds of wood.

Full details of this machine are given in pamphlet No. B-42, free on request.

Lumber and Forests

By M. Wulpi

Just now, when lumber is soaring and scarce, when users do not know what to expect, it is interesting to note some things about it. Henry Graves, of the Forest Service Department, in an address before New England Foresters, brought out the following facts:

Ninety-seven per cent. of the United States timber used in the United States is from private owned forests.

Less than 2 per cent. of the sawmills are operated in public forests.

Private owners hold four-fifths of United States standing timber. The bulk of war timber supplies were obtained from a few large centres of original forest, often involving large hauls and high cost.

Fifteen years later most of it would have had to come from the Pacific coast, the only available public supply by then.

So pine manufacturers state the bulk of original supply of yellow pine in the South will exhaust in ten years.

Within the next five to seven years over 3,000 timber manufacturing plants will go out of existence.

This will withdraw competitive influence of Southern pine and enhance price through shift of supply.

Wood pulp manufacturers are already embarrassed through lack of supply.

For ten years new mill developments for newsprint has almost ceased.

In Canada no less than 28 mills have been built by American capital.

Pacific Coast Douglas fir is already reaching the New England market.

Lake States, up to a few years ago greatest producers of timber, to-day pay a six-million freight bill to bring lumber in.

Estimated that annual growth in New England is less than half of what is being cut.

In New England, $30,000,000 is invested in wood and forest industries employing 90,000 wage earners.

New England forest area is about 25,000,000 acres, almots that of France.

France produces annually fifty per cent. more than New England in forest growth, is proving growth constantly approaching a point to furnish most of domestic need.

England proposes to plant one million acres in forest in the next forty years, and spend first decade $17,000,000.

Would these things not point to scarcity here, high prices, long hauls and substitutes?

The great need in the United States is to stimulate forest growth, conservation of stumpage, elimination of forest fires, constructive private forest program and general protective policy on our whole forest tracts.

In face of present situation there seems little show for lumber to go back to where it was during our abundant supply and wasteful cutting.

To Restore Walnut Forests

Restoration of black walnut trees is being considered in several states for 1920, says the St. Paul, Minn., Pioneer Press. In Ohio the agricultural experiment station in Wooster has just published a pamphlet by Edmund Secrest of the forestry section on the cultivation of these trees, attention being called to the great value of the lumber in many industries and its use in the great war for airplanes and gun stocks, for which no other substitute could be found in sufficient quantities. Mr. Secrest says that with proper care trees may be grown from seed or transplanting of small trees to a state of maturity where the wood will be of as great value as that of the original forest. In Pennsylvania the state factory department has undertaken extensive seed planting in an effort to restore the black walnut. One hundred and fifty bushels of seed have been planted in specially prepared ground at Mont Alto, and should produce ten thousand seedling for next spring. Many requests have been received from owners of woodland who desire to start groves of the trees. A campaign of tree planting will begin in 1920 in Kentucky for the rejuvenation of the forests, in which walnut will be one of the special species planted.

Spruce Bud Worms Do Much Destruction

Half of the balsam fir in New Brunswick has been destroyed by the spruce bud worm this year, according to a report by Prof. S. A. Graham, of the University of Minnesota, and Prof. J. D. Tothill, of the Dominion Entomological Bureau, who have returned to Fredericton after taking a trip of 125 miles through the crown timber lands of the province in company with L. S. Webb, of the Forests S. V. C.

They entered the woods about two weeks ago at Red Bank, near Newcastle, and then went to the head waters of the little southwest Miramichi. They came south across the Renous, and out of the woods at Boietown. The trip was made on foot and practically all the balsam fir which has been very plentiful in that district, has been destroyed. In some areas the pest attacked the spruce; and on the Renous the damage to spruce has been quite serious.

Chemical-Treated Wood Will Not Burn

Wood is made virtually fireproof by a new English method, which fills the pores with a crystalline deposit of fire-resistant chemicals. The air and moisture contents of the pores is extracted, and the sap water dissipated, by a steaming and vacuum process in a closed chamber. The empty cells are then impregnated with the chemicals by hydraulic pressure. When the solution has dried, each cell of the wood remains filled with crystals, which expand on exposure to heat and prevent the entrance of air. Wood so treated will char, but not burn.

NAPCO WATERPROOF GLUE

No wastage

Applied cold—and mixed cold

Profitable in its saving

Consistent in all grades of work

Odorless in the glue room

NAPCO is absolutely uniform. It eliminates waste, is easily applied, is impervious to water, and never lets go.

NAPCO joints are as strong as the wood.

H. LEFEBER

Lewis Building, Montreal, Que.

SOLE AGENT FOR CANADA

Deliveries made from either Montreal or Toronto Warehouses.

Vegetable Glue

We are desirous of opening correspondence with woodworking firms in Canada who are now using or contemplating using vegetable glue for veneer work, box and furniture panels, etc., from the finest type of furniture, cabinet or piano case work to barrel heads and other common work.

We make Vegetable Glues to fit all purposes, also a special more fluid Vegetable Glue suitable for joint work and application by brush.

IF YOU ARE ALREADY USING SOME OTHER MAKE OF VEGETABLE GLUE AND IT IS GIVING YOU SATISFACTION, WE WOULD NEVERTHELESS LIKE TO HAVE YOUR INQUIRIES AS WE CAN MATCH THE WORKING QUALITIES OF ANY VEGETABLE GLUE NOW ON THE MARKET AND PROBABLY GIVE YOU A CONSIDERABLE ADVANTAGE IN PRICE.

We are prepared to furnish all equipments necessary for the making up and application of Vegetable Glue on a rental basis affording you easy means of payment.

WE BELIEVE IN THE FUTURE OF YOUR GREAT COUNTRY AND TO SAVE YOU THE PAYMENT OF THE PRESENT WHOLLY EXORBITANT AND UNWARRANTED RATES OF EXCHANGE, WE ACCEPT CANADIAN GOVERNMENT BONDS AT PAR FOR ALL SALES WE MAKE TO CANADIAN MANUFACTURERS, THEREBY PUTTING YOU ON THE SAME ADVANTAGEOUS FOOTING ENJOYED BY THE WOODWORKING TRADE IN THE UNITED STATES.

If you have any problems to work out in the Glue line, we can assist you.

We have expert Demonstrators we can send you at short notice qualified to set you right on any proposition dealing with the use of Glue in woodworking.

We can start you right and keep you right after starting; give us an opportunity to prove this to you by opening correspondence with us.

It will cost you nothing to investigate no matter what Vegetable Glue you are now using and we believe we can give you a better product for the same money, or an equal product for less money.

Isn't it worth your while to test out this proposition?

Write us for particulars.

Victor G. Bloede Co.

The Magazine Feed Produces Greater Results

Greater security, production and saving in time, labor and money is the result of installing Reynolds Automatic Magazine Feed Screw Driving Machines. The screws are driven revolvingly their entire length, thus insuring a holding power forty-nine per cent. stronger than the hammer driven screws. The magazine feed enables each machine to do the work which formerly required three to six hand operators—reduces your labor costs and increases your production considerably.

Write us today for literature which gives a full description of these machines, also a list of users.

Simply dump a gross of screws (either wood or machine) into the hopper. The machine does the rest.

HOW DO YOU DRIVE WOOD SCREWS?

The Automatic Electric Screw Driver is small. It weighs only 6 pounds and everything larger than this is impracticable for driving wood screws.

With an automatic your men can drive screws all day long and not get tired out and it will do the work so much faster than the hand brace, that you will be putting two-thirds the men now driving screws on to more profitable work where their skill will count.

Ask for Bulletin 1 now and learn how to drive wood screws the MODERN way.

GOODYEAR

MADE IN CANADA

Where Belts Meet Dampness!

Goodyear Extra Power Belt Delivers Power and Lasts

Damp or wet belts usually slip more easily than dry belts.

Water and moisture form a thin film between pulley and belt.

Here "Extra Power" Belting especially displays its advantages.

Where there is water, moisture or steam—around the beaters in paper mills, for instance—Goodyear Extra Power delivers the power load just as under more favorable conditions.

Because Goodyear Belting has a rough friction surface which bites through the film of water and clings to the pulley, costly slipping is overcome.

Moisture rots belts, if it gets into them.

Goodyear Extra Power is rubber-sealed against moisture.

Not just enclosed in a rubber envelope.

The high-grade rubber in Extra Power is forced through and through the fabric, surrounding and protecting every strand, making a belt practically a solid unit.

That Goodyear Extra Power Belting is just as efficient and just as economical in damp or wet places as in other transmission uses, is proved by these satisfied users:

The Provincial Paper Mills of Thorold got 16 months' service from Goodyear Extra Power on a Jordan Pump where they had been getting about one month's service. They also say—"In the room where our beaters are located, the air is constantly damp. Here we have found Extra Power so superior that we use it exclusively."

Some other firms who will be glad to tell you of the satisfactory service of Goodyear Extra Power under damp conditions are:

Mittagami Pulp & Paper Co., Smooth Rock Falls, Ont.
Port Arthur Pulp and Paper Co., Port Arthur, Ont.
North West Laundry Co., Winnipeg, Man.
Dominion Pulp Co., Chatham, N.B.
Bathurst Lumber Co., Bathurst, N.B.
Gloucester Lumbering and Trading Co., Bathurst, N.B.

If you use belting, it will pay you to hear about the Goodyear way of supplying it. It will cost you nothing to have a Goodyear man call and show you how to overcome your problems. Phone, wire or write the nearest branch.

EXTRA POWER BELTING

EXPLANATION *of* THE WALLACE IDEA

The Wallace Idea eliminates waste in production in the woodworking shop. It saves high-priced time consumed by making endless trips to the large machines; power wasted by running a large machine for a small job; expensive hand sawing and planing; belt expense and floor space.

Why it Cuts Cost and Speeds Production—

The mechanical principle embodied in Wallace Bench Machines is ECONOMY. They are constructed so that the workman may do from 75% to 80% of his cabinet, pattern, fitting and assembling work right at his bench.

Over 10,586 Wallace Bench Machines in use

at the present time and they are demonstrating the everyday serviceable and practical application of "The Wallace Idea." Investigate for yourself. Cut out this advertisement, check the machines in which you are interested and we will send you complete information, also a list of representative users in various lines of industry.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without resharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,
Per O. H. BRUBAKER, Manager.

Cary's SUPERIOR QUALITY Corrugated Fasteners

SAW EDGE

PLAIN EDGE

According to final decision, after long litigation, we have been granted the SOLE RIGHT to manufacture a Saw Tooth Corrugated Fastener with a continuous cutting edge. Our fastener is beveled evenly on both sides, which enables fasteners to be driven in straight, and much easier than any other fastener made. Our Corrugated Fastener is made in various widths and corrugations, also in coils wound right and left. Try our products and you will use no other.

Samples and prices on request.

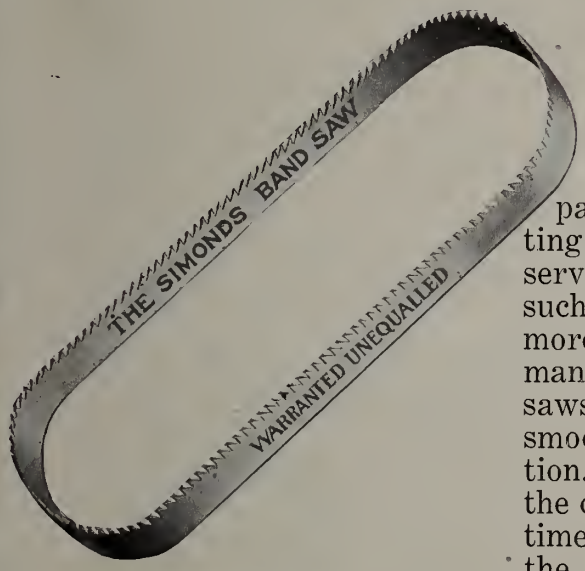
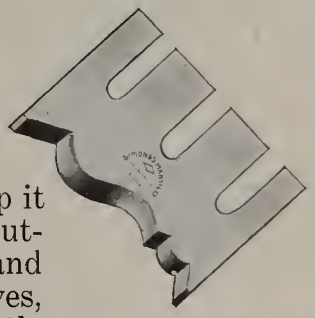
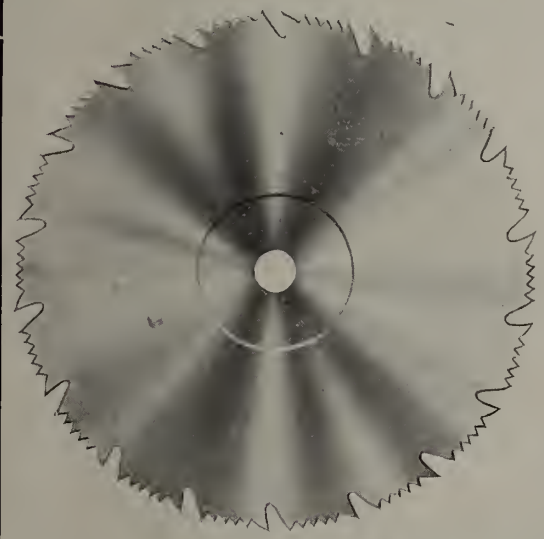
SIMONDS
SAWS AND KNIVES





For mill or woodworking shop it pays to use the better grade of cutting tools because of economy and service. The best saws and knives, such as Simonds, may cost a little more, but in the long run they are many times more serviceable. Good saws and knives mean better and smoother work and greater production. In other words, they reduce the cost of cutting and eliminate lost time for repairs which is too often the case when inferior grades of saws and knives are used.



If you want the best of the good saws write to us about any style or size. Remember we make Grooving Saws, Novelty Saws, Narrow and Wide Band Saws, Web and Scroll Saws, Swage Saw Sets and Machine Knives for all purposes. Let us send you a copy of our catalog describing the complete line we manufacture.

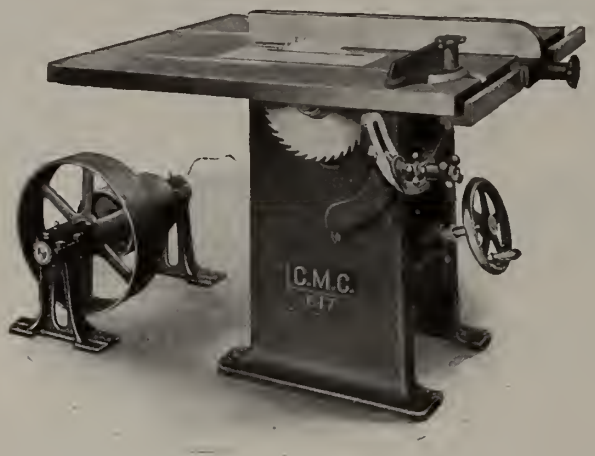
St. John, N.B. Vancouver, B.C.



NO. 617 VARIETY SAW.

This Little Saw Fills the Bill

C.M.C.

Why?

It is not so small as to be a mere toy, while it is not so large as to be cumbrous—it is just the right size. Stock as wide as 18″ and as thick as 3″ can be ripped when using a 12″ blade; 14″ blades may be used, however.

Having a tilting table, double faced ripping fence and adjustable cut-off fence, all kinds of plain or bevel ripping or cutting off may be done with great facility.

It is strongly driven, having pulley power equal to that of larger machines.

The saw blade is near the table edge, so that the operator does not have to lean " away over."

There are no sore backs caused by the 617, but great production is effected.

Special attention is requested to the following partial list of users. The saleability of any machine is the best test of its merit. The 617 sells itself.

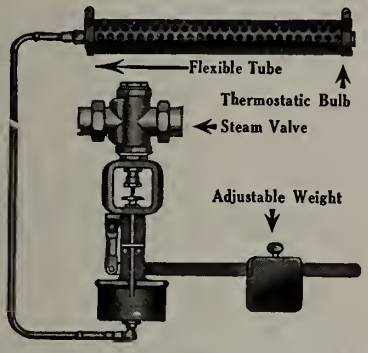
The Better Way of Controlling Kiln Temperature

The world wants finished products now. All costs are rising and your problem is to produce more. Begin by insuring your wood as it goes into the kiln. Every inch of green wood has cost you real money and represents two values—raw value and finished value. Don't allow fluctuating kiln temperature to tamper with these values. Prevent fluctuating temperatures by equipping your kilns with

Powers Heat Regulators

As long as steam pressure is maintained Powers Regulators operate. Their operation insures correct kiln temperatures, saving of fuel by using only necessary heat, saving of labor by releasing men from watching thermometers and



The Powers Regulator No. 15

Specially designed to control temperature in dry kilns, ovens, varnish and dry rooms, etc. Requires no outside power for its operation.

valves, saving of material by cutting down the loss from case hardening, warping, and checking. They also speed up the drying by fully 25 per cent.

During our more than thirty years of experience in automatic temperature control we have gathered some very profitable information for the woodworking industry. Let us show you how to save money on your kilns or other apparatus where heat is a factor. We are cheerfully at your service. Write us today.

They Save Their Weight in Gold

This is not said for effect—it's a fact.

If you took the actual bearings in a Chapman Double Ball Bearing, and weighed them against the amount of money **in gold** that you would save by using them in place of the old-style babbitted hanger bearings, or roller bearings, the two would balance.

The saving works out from 15% to 40% of the power used, when running under full load. If you are using 100 h.p. at $30 per h.p. a year, that fixes the saving at from $500 to $1,200 a year.

You can buy quite a lot of gold for that.

We use this simile to stimulate your imagination sufficiently to inquire into the utility of Chapman Ball Bearings.

If you do inquire, we'll sell you also **by an appeal to your reason.**

"You pay for them
whether
You buy them or not"

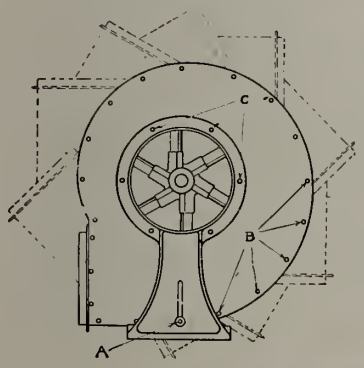
Keep Your Shop Clean

The Canadian Standard Reversible Mill Exhauster will keep your shop clean, remove sawdust, shavings, fumes, gas, or any loose materials and disagreeable odors.

Insurance rates can be reduced; floors and machines covered with sawdust, chips, or shavings, increase the fire risk.

Insurance Companies reduce the premiums where adequate precautions have been taken to prevent fires.

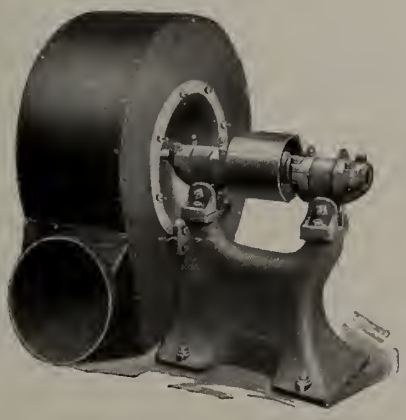
Blast Wheel--This wheel is so constructed that it will handle any kind of stringy material efficiently — such as sawdust, shavings, cotton lint. Will also handle gases, fumes, smoke, etc.



The Canadian Standard Planing Mill Exhausters have reversible housings so that the outlet can be adjusted instantly to any angle desired.

This eliminates necessity of crossed belts. Simplifies changes on alterations in piping or building.

The housing is of heavy rolled steel plate securely bolted together with angle irons. Round cast iron outlet bolted to the housing. Blast wheel mounted on heavy cast iron spider.



Every fan carefully tested by running test at speeds in excess of that required.

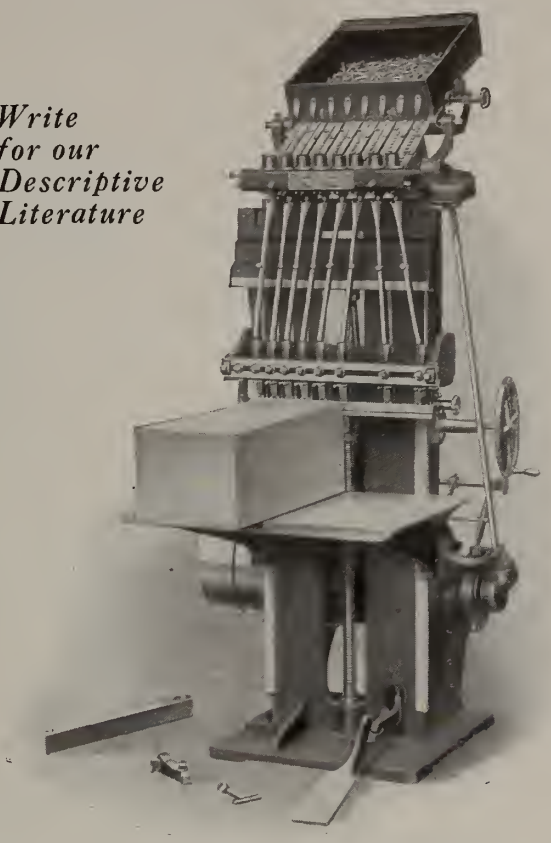
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

OLSON FRAME EXTENSION

Increases Service Reduces Costs

Just a Few Users—

Robert Bury Co. Canada, Limited, Toronto, Ontario.

Batts, Limited, Toronto, Ontario.

Gibbard Furniture Company, Napanee, Ontario.

Langmuir Manufacturing Company, Toronto, Ontario.

Gardiner Lumber Company, Galt, Ontario.

Irvin Lumber Company, Toronto, Ontario.

The Olson Frame Extension will mean increased carrying capacity for each of your Ford Trucks. They insure smooth running, perfect balance and easy operation that will prove ideal for the transportation of lumber, furniture, etc., for short or long distances.

Olson Frame Extensions are sold by all Ford dealers. Our nearest branch will be pleased to furnish you with further particulars.

44 Yates No. 275
30 and 60-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

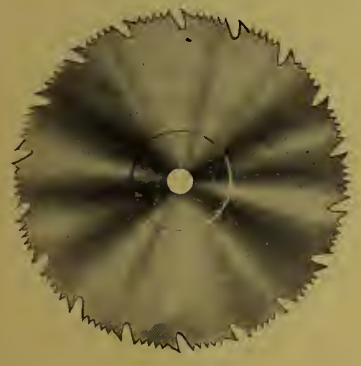
Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

8 New Andrew Mutiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

7 New Hermance Molders, 8, 10 and 12-in., stationary and slip-on heads.

Band rip saw, Fay & Egan, 42-in.
Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Carver, 5-spindle, Moore.
Door clamp, Fay-Egan, heavy.
Edgers, two, three and four saws.
Glue cookers and retainers. Glue spreaders.
Hogs, two, Mitts & Merrill.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Knife grinders, two 32-in., F. & E.
Lathe, Ober spoke and handle, almost new.
Lathes, Mattison, No. 8 auto; No. 6 block mach.
Lathes, speed, eight, mounted on iron bed.
Lock-corner machine, Morgan No. 8, full set.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, end, Sherman, fine condition.
Matcher, 24x6-in., 3 and 4 sides.
Automobile spoke machines, Defiance, complete set.
Band resaw, 50-in., Fay & Egan, tilting rolls, full set of filing room tools.
Molder, Smith 14-in. outside, latest style, practically new.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan No. 184, 12-in. outside.
Molders, inside, 13-in. American and Woods.
Mortiser and router, Fay & Egan No. 124.
Mortiser, chain saw, New Britain No. 1, 25 chains.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type.
Nailers, two, Morgan No. 8, used three months.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread.
Pony planers, 16, 20 and 24-in.
Relisher and mortiser, Greenlee.
Rip saws, self-feed, Hoosier, F. & E., Greenlee.
Router for stair stringers, H. B. Smith, flexible arm with adjustable table and forms.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30 and 42-in. Columbia; 30, 42 and 48-in. Invincible; 30-in. double Invincible.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, B. & M. double-end, also several single-end tenoners with and without copes.
Timber sizer, Fay-Egan 84s, 17x12-in.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

The Osborne & Sexton Machinery Co.
Re-manufacturers **COLUMBUS, OHIO**



100% Production

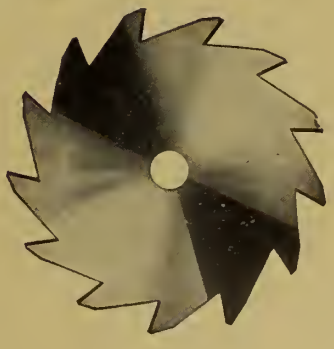
will be necessary to meet the demand for all wood-working material and furniture that will be required for the 4,000,000 buildings that must be erected in 1920.

ATKINS

STERLING QUALITY

SAWS and KNIVES

will make it possible for you to meet this demand in producing your share.



The high grade material and expert construction of Atkins Saws and Knives make possible the superior service they render.

Let Their Efficient Performance Tell You the Atkins Story of Perfection.

Write to-day for our Knife Booklet "CW" and Pattern Template Paper.

E. C. ATKINS & CO., ***Makers of Sterling Saws***

Factory—HAMILTON, Ont. **Vancouver Branch—109 Powell Street**

-getting results!

On the MATTISON LATHE, it does not matter whether the shape to be turned is plain or complicated. The most difficult square, oval, octagon, or hexagon pattern can be produced just as easily as the plainest round turning.

The work comes from the machine smooth and uniform without any of the grain in the stock being torn out, or the corners or fine members being broken off.

You are invited to send for a circular of the new Model "Mattison." It describes the heavier construction; the new cutterhead, and other improvements.

Furniture Manufacturer

C.M.C. ANNOUNCEMENT

NEW C. M. C. No. 500 DOUBLE END TENONER

For some years past the Canadian Woodworking Trade has been compelled to go outside of this country to purchase a modern Double End Tenoner. Feeling that the Trade would prefer to purchase a Canadian made machine of this type, especially so in view of the recent adverse exchange on Canadian money, we are developing and placing on the market the only up-to-date Double End Tenoner being built in this country.

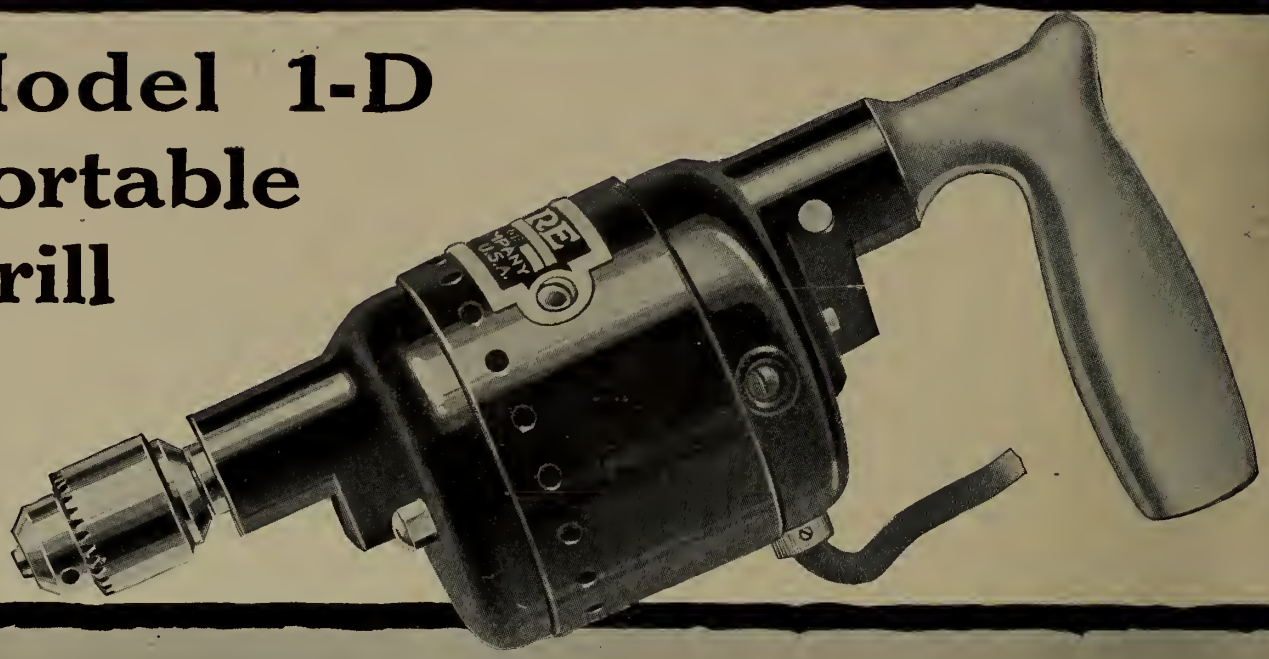
The machine, we feel confident, will be quite the equal, if not the superior, of any imported Tenoner. It will excel in convenience and effectiveness of operation and will be built with that thoroughness which characterizes C.M.C. Wood Tools.

Pending receipt of our printed descriptive matter on this machine which is in the course of preparation we would be pleased to furnish parties interested with full description in detail.

CANADA MACHINERY CORPORATION, GALT, ONTARIO
LIMITED
Toronto Office and Warerooms: Brock Avenue Subway

Alphabetical Index to Advertisers, Page 12

Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to $\frac{3}{16}$". Wood and alloys, 0 to $\frac{1}{4}$".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center $\frac{3}{32}$".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

Two New Catalogs

One for the Teacher of Manual Training and one for the Furniture Manufacturer

Which do you want?

The Manual Training book is comprehensive in that it is not only a catalog but a manual for students and teachers.

The book for Furniture Manufacturers is a catalog—nothing more—containing the American line of machines for Cabinet Shops—beautifully illustrated and clearly described.

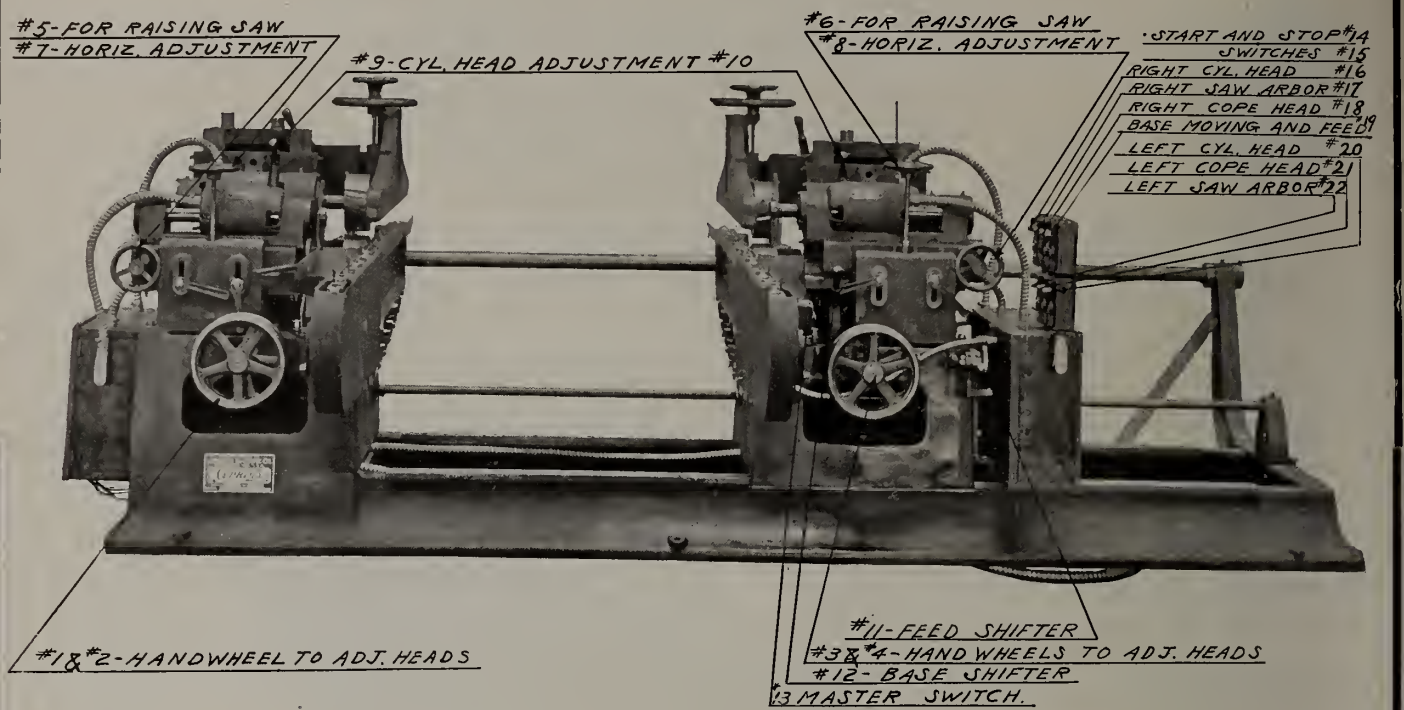
Write today for the one you desire.

Garlock-Walker Machinery Company, Limited

MONTREAL TORONTO WINNIPEG

"JENKINS"

Double End Tenoning Machine



THE LATEST IMPROVED MODEL

The re-designed model of the Hayes Standard Double End Tenoner embodying many practical improvements.

Uses—Cutting tenons on furniture, sashes and doors, phonographs and piano stock. It is also used in automobile body plants for halving, cutting off and tenoning stock.

This machine has a capacity for all lengths between 5 and 90 in. and widths between 1 and 60 in. The range of tenon sizes is: length ¼ to 7 in.; thickness ⅛ to 4 in.

It is exceptionally well designed, and constructed to withstand long and constant service. A very desirable feature is that of adjustments, all of which except the cope spindles, are made from the front end of the machine.

Made in motor driven model or belt driven model, shipping weight 9000 lbs.

Production!

The world's great need to-day is production. The world's great shortage is that of the hands to do the producing. The shortage of hands must be off-set by a greater use of machinery. The Yates C-4 Moulder is one of the most useful machines known to the woodworking trade. Look it up. You'll be glad that you did.

P. B. Yates Machine Company Ltd.

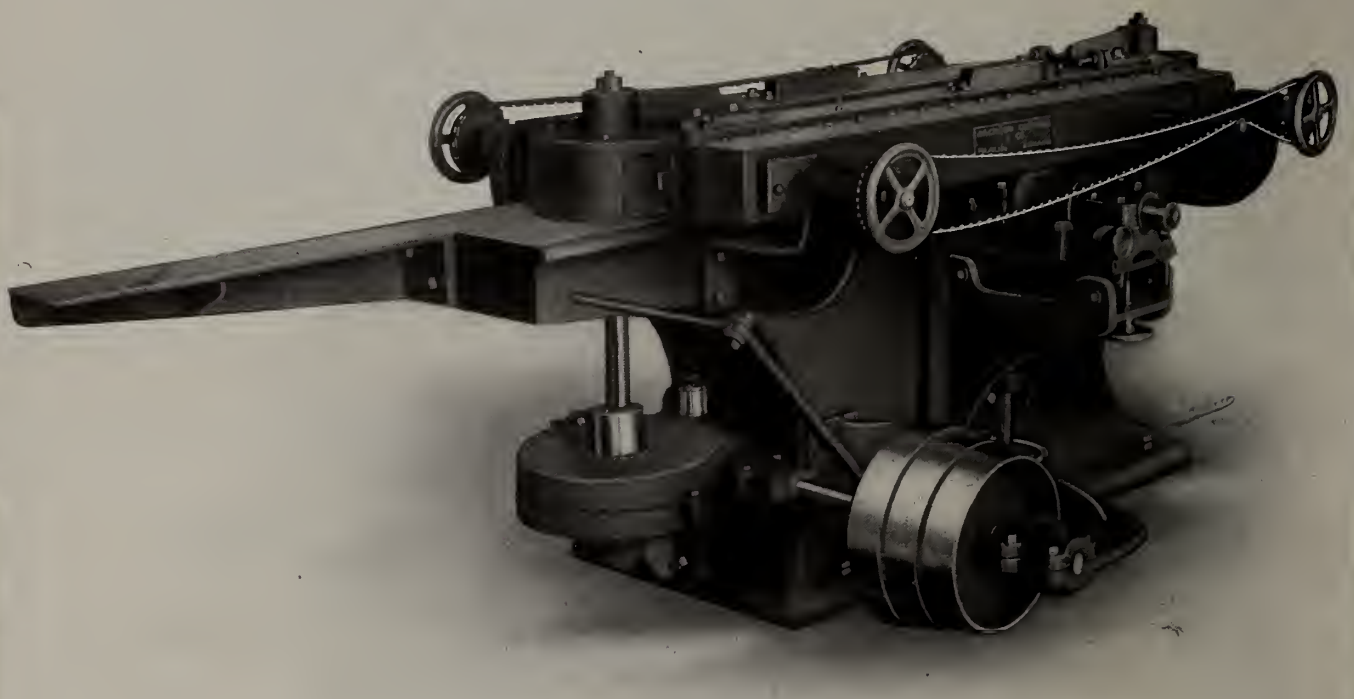
HAMILTON, ONT. CANADA

U. S. Plant, Beloit, Wisconsin

Will do the work of Five Hand Jointers in making Glue Joints

This is the guarantee given with our

No. 4 Continuous Feed GLUE JOINTER



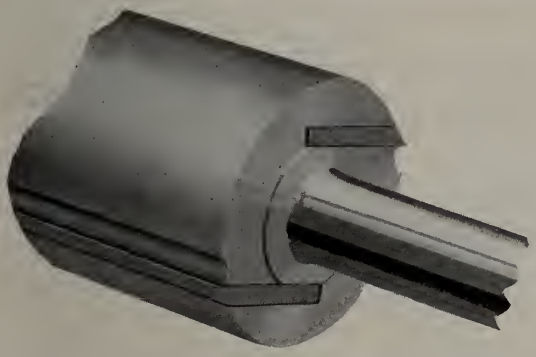
Strongest and most complele machine on the market.
Any part may be readily removed or renewed.
Feeds in opposite direction, giving 100 feet per minute.
Works material from six inches up to any length desired.
Also from one quarter to 3 inches thick, and from three-quarters of an inch wide up to any width.
1 set Shimer Special Jointer Heads supplied with machine.

Investigate the merits of this machine—it will pay you!

Jackson, Cochrane & Company

KITCHENER - CANADA

The Shimer Round Safety Cylinder With High Speed Knives



A Round Safety Cylinder that will appeal to the buyer and the user for three reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1/1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for any of the different makers' machines and in any length of cylinder.

Inventor and Designer of the World's most efficient Tubular Turning Machinery

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

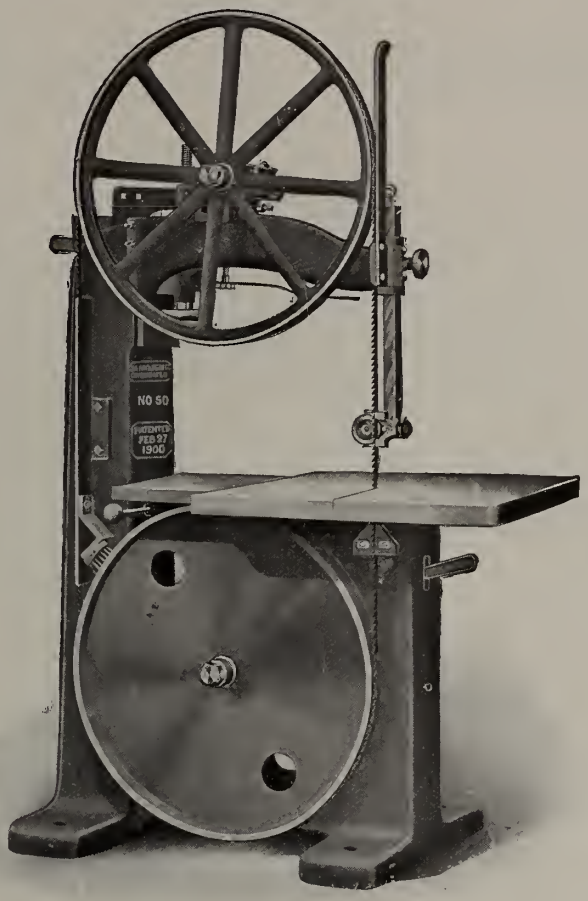
COWAN & COMPANY OF GALT, LIMITED, Galt, Canada



Save 25% to 50% of Blade Upkeep and Power Cost

Get Two, Even Three Times As Much Work

It's not the blades that wear out that cost, it's those that break.

It's the broken blades that cut down productive time and cost to repair and to replace.

Blade breakage is reduced to a minimum on Fay-Egan No. 50—36" **Square Column "Lightning Line" Band Scroll Saws.**

The Fay-Egan "Knife Edge" Blade Tension, made on the principle of a fine laboratory balance scale, is so sensitive that it compensates for changes in atmospheric conditions—yet, so flexible, you can pass a block between blade and wheel, while running, without breaking the blade. Folks tell us blade expense on "No. 50" averages 50 to 75 per cent. less than on the old timers.

The solid lower wheel acts like the fly wheel on your engine, its momentum carrying the load, so that the power consumption is reduced fully one-half, while at the same time it controls the light-spoked upper one, preventing over-running and choking down on a heavy cut.

The heavy square column eliminates vibration and permits the wheels to be revolved at 50 to 100 per cent higher speed, increasing the cutting capacity to double, and in some cases, triple that of the ordinary band saw.

As a user of saws, you cannot afford to ignore what Fay-Egan Square Column Band Saws are doing for others and can do for you. An investigation does not obligate you.

Write for Bulletin M-4

What Does SKF Mean?

To say that SKF denotes a standard of quality in a ball bearing is to recount that which has been proven and obvious for years.

To even say that SKF is a mark denoting a kind of bearing is to omit its more important significance.

For years this SKF mark has been the device of a business, pioneering in all fields of industry, championing the application of the ball bearing to mechanical design.

So that to the extent that it has overcome precedent in machine design, or upset traditions in bearing practice, SKF means more than a kind or type of bearing; it is a brand of service—working in the cause of better machine practice.

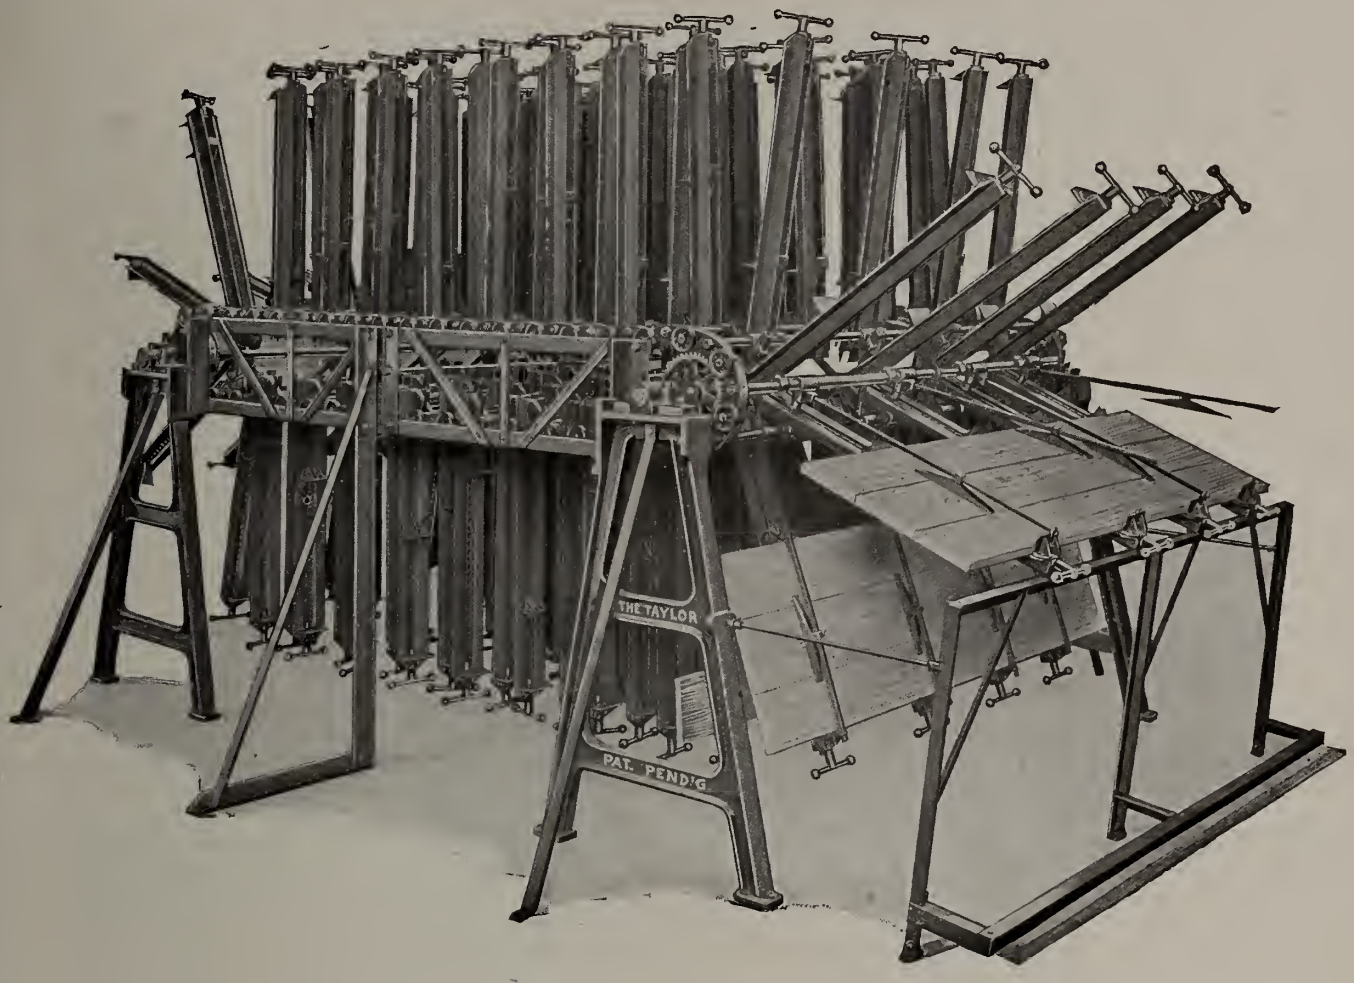
CLAMP The Taylor CARRIER

REG. U.S. PAT. OFF. TRADE MARK



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

Greenwood Miss.

"YES!" IS THE WORD FOR AMERICAN OAK TODAY!

to ALERT FURNITURE MAKERS: "A WHISPER IS ENOUGH"

From FILING CABINETS and other Office Furniture to "the bones of great ships"—OAK is **OAK.** (Supreme.)

From ***DELICATELY CARVED FURNITURE*** for the ***DILETTANTE TASTE*** to the sills and ribs of great structures whose nobility is in their sheer strength (and to the historic beams of Westminster Abbey) OAK is **OAK.** (Supreme.) ***GOOD*** **OAK FURNITURE is "COMING *IN.*"**

Without a rival, without an apology, without a substitute, OAK is indeed

"*The* WORLD'S PREMIER HARDWOOD"

(has been, is and ever shall be), AND EVERYBODY KNOWS IT.

Nature will never grow another wood as good as OAK for the uses for which it is historically appropriate.

No need to mention Economy—*you know it.*

AMERICAN OAK is PLENTIFUL, ECONOMICAL, INDISPENSABLE.

ADMIRE IT. TRUST IT. INSIST ON IT. ***SPECIFY*** *IT. USE IT.* WRITE us. TELL us. ASK us. *We will give you a Straight Personal Letter in prompt reply—WITH ALL THE FACTS.*

I O W A
BLACK WALNUT

NO cabinet wood responds as fully to the art of the furniture designer or the skill of the workman, as American Black Walnut. It meets every requirement.

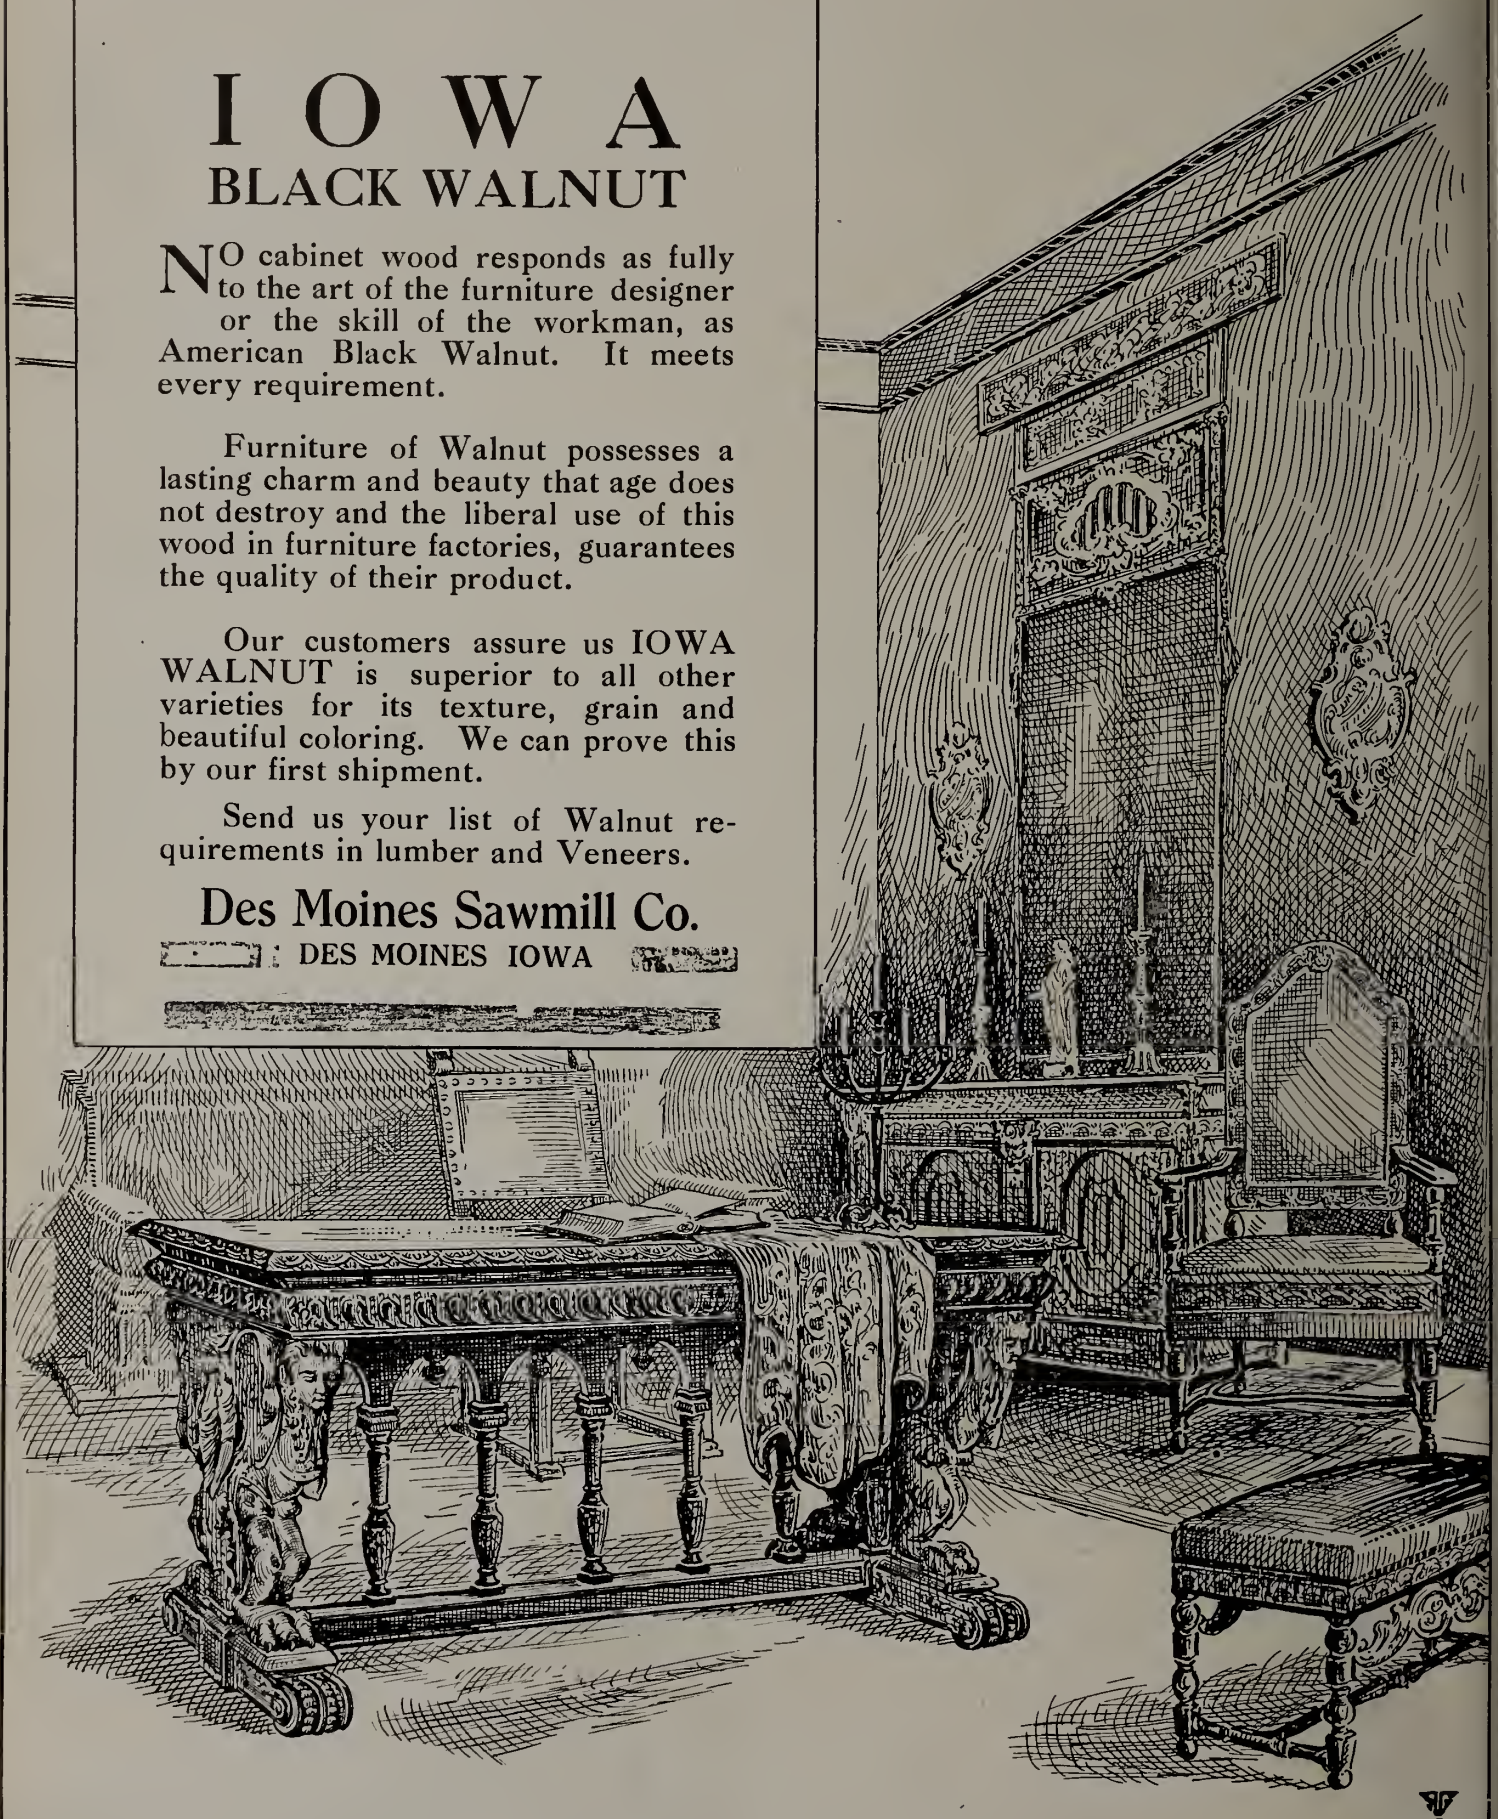
Furniture of Walnut possesses a lasting charm and beauty that age does not destroy and the liberal use of this wood in furniture factories, guarantees the quality of their product.

Our customers assure us IOWA WALNUT is superior to all other varieties for its texture, grain and beautiful coloring. We can prove this by our first shipment.

Send us your list of Walnut requirements in lumber and Veneers.

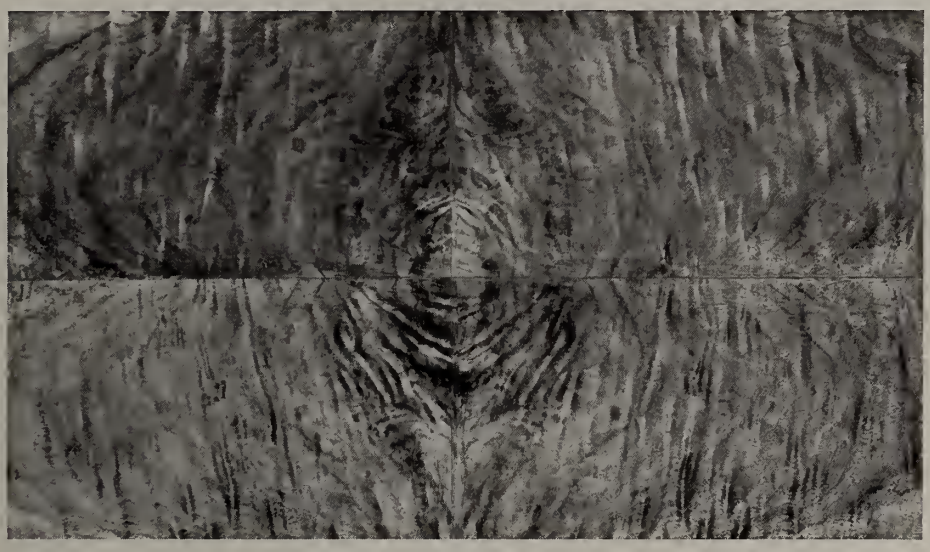
Des Moines Sawmill Co.

DES MOINES IOWA



"Hartzell" Lumber and Veneers "Hartzell"

American Walnut Exclusively



"Hartzell's Choice Walnut"

Furniture manufacturers will do well to note that we produce only American Walnut, and therefore can be classed as the logical source of supply in this wood, and our years of experience in handling American Walnut will prove valuable to you if you desire to take advantage of it.

By saying that our long experience will prove advantageous to you we mean that you should by all means take time to examine our line before purchasing, because the quality will be far superior to the average line and the price no greater.

We study your particular interests and produce veneer of the kind and quality that is best adapted to your work, and whatever class of figure you are using we can give you a complete uniform line of just the wood you want for your selection, and it will not be necessary for you to handle a great lot of all sorts of samples and then find only a few stocks suitable for your needs.

When you purchase our line you can rest assured that you can duplicate your purchase just as near as it is possible to do so in Veneers, that is our part in serving you and we see to it that you are served right.

"SEND YOUR INQUIRIES FOR VENEERS TO US."

The Canadian Wood Turpentine – made at our mills at La Tuque, P.Q. is an excellent diluent and solvent and contains no free rosin ~

This Turpentine is made by an improved laboratory process from Canadian wood and its distinctive odor clearly indicates that it is a different product from that given by the older methods of distillation ~

Wake-up, Mr. Furniture Man!
Walnut is Plentiful!

AMERICAN WALNUT

"The Cabinet-wood Superlative."

"Plenty of Walnut"

is the happiest kind of news to all lovers of really good furniture.

Notwithstanding the general belief in its scarcity, there is a lot of it left. Enough to supply with superior furniture all the discriminative people of the American Continent for several generations to come!

Of course, this means moderate prices—notwithstanding Walnut's superlative traits as a cabinet-wood—non-shrink, non-swell(n o n - w a r p (drawers slide easily, for 300 years if properly made)—and notwithstanding the rapidly growing insistence on American Walnut by the best American people.

The Brochure, de luxe, on American Walnut has been prepared for your library table. On your request it will come, with our compliments. Drop us a card, please. Thank you.

J. WALTER & SONS

KITCHENER - ONT.

Shall We Divide Canada?

IN 1867 our fathers consummated at great price a union of all the provinces and interests of Canada. For over half a century the provinces of Canada have developed together, each the component of the other.

Canada must be bound together as it is to-day, not so much by the machinery of government as by ideas held in common by all and freely exchanged, so that all sections sympathize with each other. This result has been accomplished primarily by the press, particularly the weekly and monthly periodicals and business papers.

They have no local or sectional bias.They go to all parts of the Dominion. They serve all parts alike. Their service is in bringing all provinces close together into one great nation through one common understanding.

Canada must not be split into half a dozen sections—weak with the evils of sectionalism, disastrous in the extreme—overflowing with narrow provincialism.

Emanating from we know not whither, comes an idea that will rip asunder all the good done in over half a century of patient building.

It is proposed to tax the very thing that has bound Canada into one—to place on the nation-binding press a zone postal tax which would increase the postal charge upon national periodicals as high as 800 per cent. It means loss to you personally and a loss to your country. It will weaken, cripple and in some cases destroy Canadian national periodicals. You will be deprived of papers that have kept you informed on your country's problems, your business problems—that have helped you in your work. Such magazines as do survive will cost you much more.

The publishers are not trying to evade fair taxation. They will gladly accept any fair tax upon their profits.

But is it fair that you should be taxed out of getting journals, papers and magazines that have helped you build your business and in turn built the business of the country?

If you believe in national ideals and national periodicals, sign attached form.

Tear off and mail to-day

CANADIAN WOODWORKER,
345 Adelaide Street West, Toronto, Ont.

I am opposed to any zone postal law which would mean charging higher subscription rates to subscribers, according to distance from office of publication.

Selling at Prices Prevailing

The uncertainties which surround the manufacture of furniture have virtually forced the furniture makers to adopt the policy of accepting all orders with the prices left open and billing for the goods at the prices prevailing at the time of shipment. That this policy is just and equitable is admitted, yet it has in many instances aroused considerable resentment on the part of the retailer.

The dealer thinks he is being treated unfairly and in some cases even discriminated against, that selling at prices prevailing is harsh and unjust. This is not the case and it will be found that the majority of the furniture producers are treating their customers with absolute fairness and all their dealings are prompted by a spirit of justice.

On the other hand isn't the retailer worthy of a certain amount of consideration? He is the mainstay or backbone of the industry and the furniture makers should make every effort to retain his good will and make his problems as simple as possible.

While selling at prices prevailing is admittedly just and equitable—it was suggested in the March "Canadian Woodworker" that selling at sixty days was a better method—it none the less works a hardship on the dealer. He does not know what he will have to pay for the goods ordered and what is even worse, he does not know the real replacement value of the stock on his floor.

If the goods on order were to be shipped at a fixed price he would then have an accurate basis on which to value his stock, but under present conditions such a guide is lacking. While he may know that values are steadily rising he does not know what the increases represent or when they went into effect.

Under these circumstances it would appear as if the furniture producer should adopt the policy of advising the trade of every advance in values. When manufacturing costs reach a point that makes an increase in the selling price imperative he should figure out the new selling price and immediately issue a price list indicating the increased values.

If this were done the retailer would not be working in the dark. He would know the replacement value of his stock and would also have a slight idea of what the goods on order will likely stand him. With this information he would be in a position to conduct his business on a more intelligent basis and one of his chief grievances would have been removed.

It is very gratifying to learn that one Quebec furniture maker has adopted this policy. The last price list issued by this concern carried the following notice: "Owing to unsettled conditions and continually rising prices for all kinds of materials, we regret exceedingly to be compelled, like other manufacturers, to stipulate that all orders will be accepted only with the distinct understanding that prices current at the time of shipment will be charged.

"You will be immediately notified when these prices are withdrawn. Then you can have an opportunity of further advising, if necessary, in reference to any orders unshipped. We are anxious to give you every possible advantage that can be had under present conditions."

This is the spirit that should prevail throughout the industry as a whole. If other manufacturers were to adopt a similar policy it would go far to regain the goodwill of the retail dealers and this same goodwill might prove a very valuable asset should the present demand ease off.

Value of Dry Kiln Not Realized

Partly due to the insistent demand for large quanities of thoroughly seasoned lumber for war requirements and to the fact that the real worth of the dry kiln is becoming more widely recognized, the artificial drying of lumber has made huge strides during recent years. In spite of this, it is doubtful if the majority of those operating dry kilns, or those drying stock by the slower air-seasoning method, have ever stopped and figured out just what an efficient kiln, skillfully operated, will do, what it will save and how it may be used to the best advantage.

Today green hardwoods of any thickness can, with proper predetermined treatment be kiln-dried right from the saw with better results and a smaller percentage of loss than if the material had been air-dried. Not only are better results secured and part of the ordinary losses eliminated, but it is no longer necessary to have thousands and thousands of dollars tied up for months, and even years, in large stocks of expensive lumber while air-drying. The interest on the capital thus tied up would more than pay the interest on and the upkeep and operation of a modern dry kiln.

We Should Be of Good Courage

With Great Faith in Canada and the Splendid Opportunities Which Lie Before Us

By Wm. Cawkell, Toronto, Secretary Furniture Manufacturers' Association.

Directly peace was assured in 1918, general statements were circulated that cost of living and prices would come down. In May 1920 we find that prices for almost every commercial article have increased enormously and are still increasing.

Again we are told that wheat and steel were the basic products and that when they came down other articles would quickly follow. We find now that wheat and steel are still advancing in price. Wheat is bound to have an important influence on the cost of living and general prices in Canada. Let us therefore consider as to the world's visible supply of wheat and as to what we may expect from this year's crop.

The present situation is that European countries are all wheat hungry and will require to import at least 760,000,000 bushels.

The Government report on conditions of winter wheat in the United States as at April 1st estimates the crop at 75.6 per cent. of normal, compared with 99.8 per cent. a year ago. It is too early for an accurate estimate for the final crop of 1920, but present conditions give a yield of 483,617,000 bushels. In 1919 production was 731,636,000 bushels.

It has been stated recently by reliable authorities that the new crop of wheat in Canada will fetch around $3.00 per bushel as against $2.55 for the last crop. The food minister in Britain recently stated that the world's food shortage was still a serious factor and he stated that the nations were faced with the prospect of a considerable reduction in the world's supply of wheat, and he feared a rise in prices would be reflected in every other commodity. The supply of butter he stated to be only half the pre-war standard with no early likelihood of improvement.

Bank clearings in April show an average gain for the month in 26 Canadian cities of 30.4 per cent. The April figures for customs receipts show an increase of more than $6,000,000 due to all round business and would have been a great deal more but for the adverse American exchange.

Several banks have signified their intention to make new stock issues to shareholders. This means that further funds will be drawn out of savings deposits and will be permanently at the service of the banks for the purpose of financing business activities.

Building trades activities for February show a substantial increase and comparing the average of 1920 with the average of 1919 for the same period it shows 129.6 per cent. increase calculated on the returns from 35 cities. The figures for March show a gain of 145.5 per cent. over March 1919.

The foregoing facts do not look anything like a slump in business or a reduction in prices, but quite the contrary and support the opinion that has recently been expressed by good authorities that present conditions are the logical result of supply and demand and are normal in the proper sense of the word.

The present high prices are the result of definite causes and are legitimate. Money is an article that we barter or exchange for commodities. If commodities were as plentiful to-day as they were in 1914 and the quantity of money in existence in like proportion, then excepting for the natural increase in the comforts of living, prices would have remained much the same, but as I have endeavored to show there is a world wide shortage of commodities and foods.

Now we will turn to money. In 1914 the total money of the world, exclusive of Russia, was $7,000,000,000, at the present time it is stated to be $56,000,000,000. In addition to which one must take into consideration the world's debts which have grown from $40,000,000,000 to $265,000,000,000 now. The ratio of gold to the paper currency of the world was in 1913 70 per cent., it is now approximately 12 per cent. I wish to particularly call your attention to the fact that the paper money increased $33,000,000,000 during the war period of 50 months and has increased $16,000,000,000 since in a period of 18 months. Is it any wonder that with this plentitude of money and scarcity of commodities that prices have risen and is it not reasonable to expect that prices will continue much the same as they are now until the relation between the supply of commodities and the supply of money changes in their proportion to each other?

Until wheat and other necessities of life become more plentiful the cost of living is going to remain much as it is at the present and if wheat advances as expected, the cost of living is going to go higher still, therefore, wages cannot come down and the cost of production of furniture and other articles is going to remain as high or higher than they are at present.

Distribution is one of the four economic factors of business, and the cost of freight is a factor to be recognized in costs because

(Continued on page 48)

Use Cased and Columned Openings

Effective When Well Planned—Carefully Worked Out Details Help Cheapen Construction—Stock Patterns and Designs Desirable Where Possible

By W. H. Shaw

The cost of building is undeniably higher than it has ever been before. Moreover, the increase still goes on. It does no good to deplore this condition. Certainly, what were normal pre-war prices will not likely return again in our time. Many believe that building costs will go still higher. As a matter of fact many items of building cost have not advanced in anywhere near the same proportion as general prices.

Reductions for some years are problematical. It is reasonable to believe that they will only come very slowly and be of slight amount, for there is a vast amount of prospective building that has been merely postponed and there is no corresponding accumulated supply of material to meet it.

Home Building to Continue

The fact that in these times of reconstruction along some lines, even manufacturing concerns are expending vast sums on the housing of their employees, says more than mere words can express as to the desire of each individual to give his family the advantages of a home.

Many families need better homes and many who did not have money to build with before, have it now. If the cost is high, thousands have the increased means to meet it. The need of a home and the ability to finance it should decide the matter. Future reductions of cost will not pay for the continued extra maintenance cost of the old home, the outlay for rents, if renting, or deprivation of the satisfaction of the home of one's dreams.

It is well within the truth to say that if prospective home builders would give as careful attention to the economical planning and designing of houses as lately has been given to the economy of foods and other necessities, the cost of building would be only slightly higher than three years ago.

Careful Planning Necessary

The man who builds now should put unusual study on the plan to see that every stick of timber and every hour of labor put into the building shall do its full duty, that the house shall be so built as to reduce the upkeep, and even beyond these the mistress of the house must be assured—and should know that not one extra step shall be required in the keeping of the home.

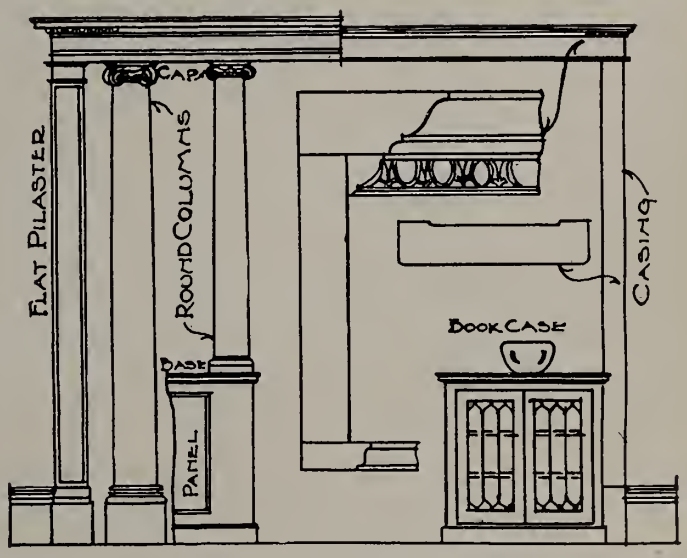
By this careful planning is meant: economy of actual building operations, due to having plans and details definitely figured out—the old custom of expecting the house contractor to be both millman and builder is wasteful in the extreme, as he has not the equipment nor the time to build special fittings on the job; making every square foot of space serve some useful purpose; making every dollar of investment show its worth in the attractiveness of design; planning for a minimum of housekeeping work and a possible elimination of the help question—this may be counted under the head of lower upkeep cost; neutralizing the high cost of furnishing by eliminating the need for so much of it—moderate size rooms of a compact, convenient arrangement will do this.

Probably nothing is more economical, and at the same time artistic, than the proper treatment of cased or columned openings between rooms, especially where living room and dining room are thus connected.

Suitable Openings between Rooms

The term cased opening refers more particularly to wide openings between rooms, but actually every door or window is a cased opening. In a well designed house the tops of all doors, windows and wide openings are kept upon the same horizontal line and the finish will be the same design for all in a given room if not throughout the whole house. This is a general statement as to the finish applying to very important work and must be allowed some latitude in a house of ordinary cost. There is no reason, however, why the heights should not be kept even, because an even width of frieze is then obtained, making the decorative scheme much more effective.

Small windows in single sash, leaded effects, may be placed without regard to the above rule, provided



Treatment for cased openings, with details of trim

they cannot be readily kept even, but they should never be put high enough to cut into the frieze.

Details for Cased Opening

Several methods of treating a wide opening, such as might occur between hall and living room, or living room and dining room, are shown in the first illustration. On the right is a simple casing with an entablature effect for the cap and a plain plinth and base mould, at the floor. This would make a dignified and effective trim for all doors and windows. A bookcase is shown in connection, which is 30 inches high, the most it ought to be when placed in an opening 7 feet high. The doors contain leaded glass and the back, facing the adjoining room, is panelled.

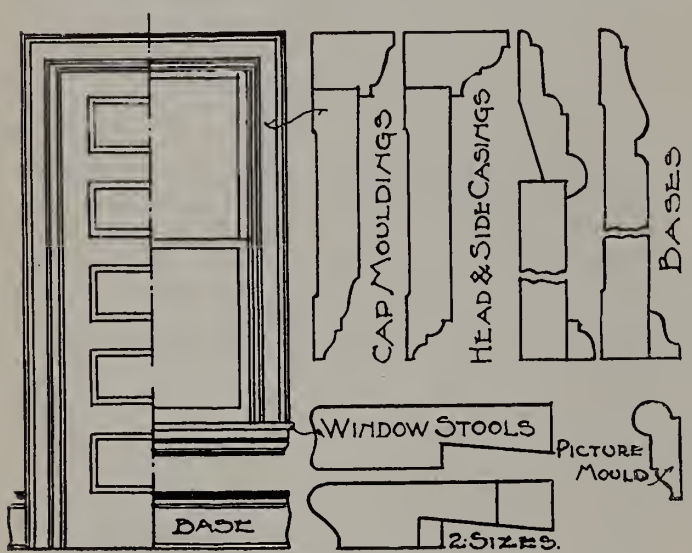
At the left is shown a flat pilaster with a panelled face and simple cap and base. The cornice above is similar to that at the right but a little heavier, with an additional plain piece of board just above the open-

ing. This gives extra height and brings it into proportion with the pilaster, which is wider than the casing described. This would be very effective, but it could be made more ornamental by the addition of the round column shown adjacent to the pilaster. The base is shown in line with the base of the room and in good proportion. The cap in this case is known as Ionic, but could be Corinthian, Composite, Doric or Tuscan in design.

These names refer to the five orders of architecture and, properly speaking, only the cornices and other portions belonging to a given order, should be used with its column, but it is customary to disregard some of the least important of these details, in the moderate priced house. In a costly house these matters should be absolutely correct. The caps of the columns may be carved in wood, but composition in beautiful modellings is now obtainable, that can be finished to represent any of the well known woods, and is in universal use.

Construction under Column

A smaller column is shown supported by a panelled pedestal which is continued to the pilaster, form-



Half elevations of door and window, showing designs for trim

ing a shelf that will hold a vase or potted plant. Note that the panel does not extend under the column. The plain surface is in much better taste. The space occupied by panels could be arranged for books with good effect. The pedestal will be best if kept not over 30 inches high. Sections of casing and cap are shown in larger scale.

Half elevations of a five panelled door and an ordinary two-part window, with trim of a different character from that in the previous figure comprise the second sketch. This would be very appropriate for a colonial house. Two sections of trim are shown at larger scale that would give much the same appearance. These are of stock design and could be obtained anywhere, or at least something very close to them.

Stock Designs Lower Costs

Any means of reducing the cost of building, without reducing the practical value of the structure, should prove welcome. One of the big items of cost is the outlay for trim and interior woodwork. In structures of even moderate cost the interior trim frequently is made to order.

"Making trim to order" means that the owner pays for the "set-up" for a run of a few hundred lineal feet of casing, base, and moulding, and possibly 150 to 200 feet of window sill and apron. Under such circumstances, the set-up costs vastly more than the run. The owner secures the benefit of a slightly different form of trim—he cannot tell wherein it differs from that in the next house if asked—any pays a very heavy premium for "something different" which is difficult and expensive to produce and of no value greater, intrinsic than other trim after it has been produced.

For the benefit of both millman and builder it should be known and understood that the milling on stock patterns of trim—the machine work—is equal if not superior to that on special patterns. The only advantage gained by paying three or four prices for special designs is the design and there is not one person in a hundred who can distinguish between special and standard patterns. Here is an excellent opportunity to lop off a part of the "high cost of building" without decreasing the value.

Attach Base Mould to Floor

This illustration also shows sections of cap moulds, such as would be required for a chair rail or wainscotting. Two styles of base are shown, one of two members and one of three members. The little base mould at the floor was originally devised to be nailed to the floor, independent of the base board. This allowed the floor to settle without leaving an exposed crack under the base, but carpenters everywhere nail the mould to the base, thus defeating the object for which it was devised.

Window stools are shown in two stock patterns and are made in more than one size to accommodate frames of different widths. The apron or mould used just beneath it may be of various patterns but is often made of the same detail as the upper portion of the base mould, depending on the style in which the room is carried out.

Placing Picture Moulding

The picture mould shown is a very simple stock design. Ordinarily the mould is so small that its position is of more importance than its contour. With a deep ceiling effect its place is properly at the junction of the two papers, below the frieze. In chambers and similar rooms where the wall paper is continued in one pattern from floor to ceiling, it goes very properly in the angle between the wall and ceiling. These rooms are usually on the second floor, with lower ceilings and this position for the picture mould tends to make the ceiling look higher.

Modern Merchandising

The following extract is from a letter recently received by Messrs Graham-White Co., Hendon, Eng.: Having read in the paper that you are now building furniture in the place of aeroplanes, I write to ask you whether your firm would build me a kitchen table, price not more than 12s., and please deliver same by aeroplane. I have quite a nice little garden where it might be possible to alight, but tell your pilot to be careful of my neighbor's fence, as he is touchy at times. A reply by return will oblige.

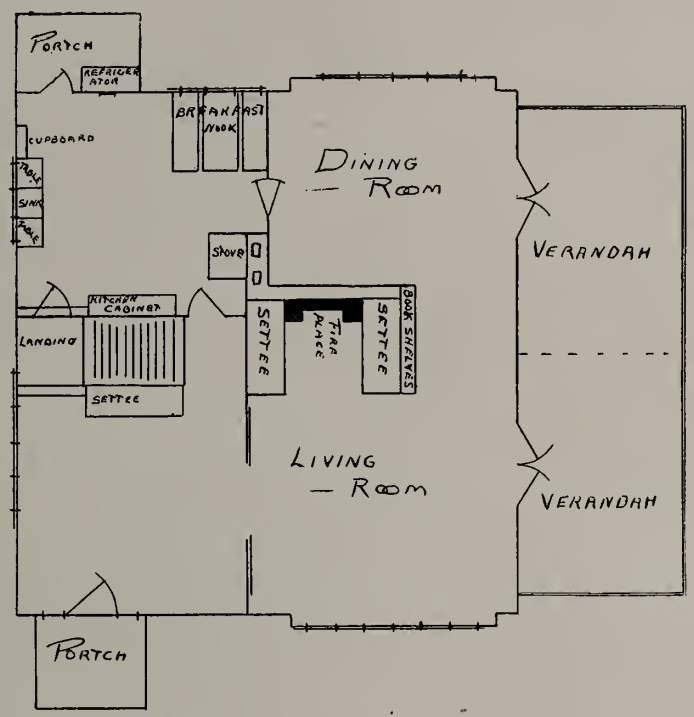
Do you prefer a slow running main shaft and a fast running countershaft, or the main shaft running at a high rate of speed?

Designing and Planning a Home

Important Items Which Are Often Overlooked—Make Provision for Adequate Ventilation—Work from Inside Out—Long Horizontal Lines Suggest Comfort

It has been said that the home a man builds is a true expression of himself. If the house were constructed according to plans and details worked out by the owner, this would, to a certain extent, be true, but if one were to judge his fellow men by the buildings seen on all sides, the result would not be any too pleasant. While a man may be striving, unconsciously, to express his personality when planning his home, yet in the majority of cases he is badly hampered through a lack of knowledge of the true principles of designing a home.

The question might well be asked:—What is a home? To those who are vain and wish to make a display, it is something that represents the size of their bank accounts; to others it is a place to eat and sleep in; to all it should be a place to live in. It should be designed to combine comfort, beauty and economy and the finished structure should suggest homelikeness.



Layout planned for comfort and convenience

There are many points to consider when preparing plans, too many to be touched on in an article of this length. The first and probably the most important is the design. The two-storey square house is supposedly the cheapest type to construct and is undoubtedly the most difficult to make beautiful. A house should not stand up on its hind legs but should cling to the ground and nestle into its surroundings. The long, horizontal line is the line of rest, and any house which embodies such lines, expresses comfort and coziness. As will be seen further on, even the square house can be given a rectangular appearance.

The roof must be given close study. It is more than a top to the building, something put on to keep out the rain and weather. It should convey the idea of substantiality and shelter. This is best suggested by a plain unbroken roof. If small dormers are added, they should not be large enough to attract attention and should be designed to repeat the line of the roof and the gable. A roof that is broken and cut-up ceases to function as a roof, that is, as far as suggesting shelter is concerned.

Decoration Out of Date

Decorations should be reduced to a negligible quantity, if not eliminated entirely. The lines and design of the building, if properly executed, should convey all that is intended without having to resort to large cornices, brackets, scroll work and heavy timber construction. These items have been used in the past, by those who did not understand designing, to overcome bad design. They have little place in modern home-building.

The eyes of the home, the windows, are most important. The old idea of a large hole in the wall filled with a single or double light sash is rapidly passing and we are experiencing a return to the small pane and mullion window. Instead of being placed at regular and stated intervals around the house, they are being arranged in little groups and so spaced that a sense of balance is obtained. Windows placed high up under wide eaves give a further suggestion of shelter and add to the attractiveness of the whole.

Planning from the Inside

A factor that is more and more determining the location of the doors and windows in the furniture and furnishings that are to be utilized in the home. The house is planned around the furniture to be installed and from the inside out. This is as it should be as it enables a person to work out many pleasing interior effects, as suitable places can be provided for the pieces necessary to complete the results pictured. Thus in the living room a length of unbroken wall should be provided for the piano. Working this way the furniture and other features can be placed to the best advantage and a very attractive interior secured.

The entrance and chimney can also be worked into the general plan so as to add to the beauty of the structure, express individuality and personality and further carry out the idea of homelikeness and coziness. The entrance in particular can be made to express both an invitation and a welcome.

Well Arranged Layout

The accompanying sketch illustrates a ground-floor plan that might be utilized for any seven or eight-roomed square type house. The upper floor is not shown as it does not contain any special features, merely showing the usual arrangement of three or four bedrooms with bath.

The lay-out of the lower floor is worthy of a little study. As will be seen, entrance is made into a hall. This may not be according to common practice as many houses are being built with the front door open-

ing into the living room, thus doing away with the hall which is considered as so much waste space. Doing away with the hall has its disadvantages, especially in winter, for, when the door is opened to admit anyone, a goodly portion of the cold outside atmosphere is also allowed in. This is not conducive to warmth or economy in heating. The hall shown can be provided with mirrors, closets and other furnishings that would contribute to the comfort and convenience of all who enter.

Entry to the kitchen is gained either through the hall or by means of the stair landing. Placing the stairway as indicated with a low landing at the bottom and a door opening into the kitchen does away with the back stairs so often included in the modern house, and thus tends for economy in construction. The basement is reached by means of a stairway under the front stairs.

Provide for Equipment in Kitchen

The kitchen is the workshop of the house and is planned and laid out accordingly. The elimination of the pantry is probably one of the most noticeable features. A good housekeeper would, probably, say that the person who built a kitchen without providing a pantry was crazy but at the same time she would likely think that a carpenter who had to run into an adjoining room for every nail, screw or other item required, had something the matter with him. Why did he not keep these things on or near his bench? The same idea is followed here. This kitchen is a veritable laboratory and the walls are virtually lined with shelves and cupboards so that everything is at hand and may be secured with a minimum of steps and effort.

The sink has a table at either end and a cupboard is provided at the far end for utensils and dishes. The other pieces installed include the useful kitchen cabinet, stove with ventilating hood over it and a breakfast alcove. The refrigerator is in the back porch and is constructed so that access to it may be had either through a suitable opening in the kitchen wall or from the back porch.

It will be noticed that a plentiful supply of light is provided at the far end for utensile and dishes. The number and arrangement of the windows. The ventilation of the whole lower floor was carefully considered. The two sets of windows in the kitchen, together with a transom over the rear door provide a cross-current of air that would keep it cool and comfortable in hot weather. In addition, the arrangement of the doors and windows allow for a current of air either from side to side of the house or from back and front.

Attractive Living room Fireplace

The living and dining rooms are not separated but a fire-place with built-in seats partially divides the two rooms. Many builders are combining the dining and living rooms into one large room, and in this respect this plan is open to criticism. The back of the inside seat, which does not go to the ceiling, is fitted up as a built-in bookcase. The base of the other seat is used for holding kindling and coal for the fireplace. This fuel box is filled from the hall through a small concealed door.

The French doors open on to a large verandah. It is becoming more and more the custom to place the verandah on the side of the house. This tends more for seclusion and quietness. Both the upper balcony, which is fitted up as a sleeping-out room and the verandah, are enclosed with glass for greater comfort. It is here where the long lines and rectangular appearance is gained as the main roof is extended right over the sleeping-out porch and verandah.

Another feature worthy of mention is the ventilation of the attic or third storey. If a window is installed at each end near the floor and provision made in the chimney near the ceiling for an opening to carry off the warm air, a circulation of air can be secured that will cool not only the attic but the whole house. This idea is used to a considerable extent in the Southern States where the heat is so oppressive and might well be embodied in all houses where comfort is one of the main considerations.

We Should Be of Good Courage

(Continued from page 42)

raw materials must be purchased and transported to the seat of manufacture and after they are manufactured they must be distributed to the consumer; a very important matter, indeed, in a country like Canade where commodities have to be carried long distances. I would therefore like to call attention to the recent annual report of the Canadian Pacific Railway in which Mr. Beatty, the president, states in part "That notwithstanding the gross earnings of the company were the largest in its history and exceeded the gross earnings of 1918 by $19,391,362, the net earnings were less by $1,669,351. The large increase in working expenses of $20,960,713, following as it does an increase of $17,191,993 in the working expenses for 1918 making a total increase in 1919 over 1917 of $38,-152,706, is a striking example of the effect of the increased cost of wages and materials in the operations of a company—even one conservatively and economically administered, as are the affairs of the C. P. R.

I have quoted these figures because they are an example of what is occurring in every furniture factory in Canada and also because if the C. P. R. fell down so much in their earnings with the largest gross receipts in the history of their company, I think we may reasonably anticipate higher freight rates, and, therefore, higher costs of production.

There are unfortunately, even in Canada, men who are always looking for trouble, men who ever since pre-war times have been expecting prices to drop and trade to become slack, in fact they almost seem to regret that such is not the case. If, however, a large number of such men in any industry were to talk in this despondent manner, they would by their suicidal action cause a depression. What is required at the present time is that every firm should go ahead in a business-like manner, not speculating, but taking conditions as they are and being full of courage in the present, with faith in the future.

Everyone in the furniture trade and in other industries in Canada, should do their utmost to encourage prosperity by working hard to make their factory or business as efficient as possible, and to advertise in a systematic manner, so that should there be a temporary falling off in the general business of the country, they will have, by their foresight, created a growing demand for their product which will then stand them in good stead.

Furniture Makers and Retailers Convene

Prices Prevailing Real Live Issue—Both Sides Present Cases—Satisfactory Solution Still to be Found — Standardized Bed Sizes and Labor Situation Touched On

The United States Retail Furniture Dealers' Association recently held a convention at Chicago, Ill. By special request a number of furniture manufacturers and representatives of the different furniture manufacturers associations were in attendance.

This meeting was called primarily for the purpose of discussing that vexatious question "Prices prevailing at time of shipment."

The first day was given over almost entirely to an open discussion on prices prevailing. An effort was made to see if this unsatisfactory clause could not be eliminated and business conducted under a fixed or guaranteed price; in fact the retailers made it clear from the beginning that this was the main purpose of the gathering. Prominent retailers and manufacturers took part in the discussion, the latter being led by Benjamin Bosse, mayor of Evansville and president of several furniture companies.

The furniture makers maintained that they were not desirous of continuing the practice and would welcome the day when the clause could be done away with entirely. They explained, however, at great length how at the present time prices prevailing was the only solution and was absolutely essential to conducting business at a profit, for the furniture manufacturer himself was forced to buy his raw material under similar terms, and, having to buy that way, it was only a case of self-preservation to sell his product the same way.

Many interesting points were brought out but nothing of a definite nature was accomplished. It was then decided to appoint a committee of three manufacturers and three retailers and let them see if they could evolve a solution that would prove satisfactory to both parties.

This committee, which consisted of Benj. Bosse, Evansville; J. L. Schnabig, Chicago; and E. P. Stephen, New York, for the manufacturers, and three prominent retailers discussed the matter for hours without reaching any agrement. R. G. Alexander, one of the retailers, then proposed a resolution to the effect that "now is the time to return to our former status of guaranteed prices with orders signed by the buyer and not subject to cancellation; this to be in force from June 25, 1920." A vote on this stood three to three and here the matter rested.

The following morning A. C. Brown of the Case Goods Manufacturers' Association took the floor and stated that the manufacturers were desirous of doing all in their power to meet the retailers, and in order to hasten the time when the prices-prevailing clause could be relegated to the past, the gentleman representing the furniture manufacturers had requested him to read the following resolutions. These were only suggestions as those present did not have the authority to do more than take the sentiment of the dealers and make representations to the manufacturers pertaining to any changes that it might be advisable to make.

WHEREAS, The buying of lumber, glass and other important materials used in the manufacture of furniture, at prices prevailing at date of shipment, is very unsatisfactory to the manufacturer of furniture; and,

WHEREAS, The buying of furniture by the retailer at prices prevailing at date of shipment is very unsatisfactory to him;

Therefore, We recommend to the manufacturer and retailer as follows:

FIRST: That the manufacturer use every means he may have or can acquire, as soon as possible to buy his materials at guaranteed price for stated periods. As soon as this is done, the manufacturer of furniture is asked, in turn, to guarantee a price on his furniture to the retailer.

SECOND: That because of over-buying by the retailer and over-selling by the manufacturer, the retailers be asked not to increase their orders with the manufacturers beyond their reasonable requirements; and that the retailer assist the manufacturer whenever asked, in checking, verifying, reducing or, in a better manner to pro rate the furniture to the retailers who may be in the greatest need of same.

THIRD: That any unfair or unbusiness like practices by either manufacturer or retailer be condemned by both manufacturer and retailer, and that every possible means be used by both to eliminate any such unfair methods, it being recognized that any unfair method is injurious to the industry as a whole.

FOURTH: That the retailer assist the manufacturer, who has too many orders on his books, in reducing them, when asked to check, reduce or confirm, by doing so and, after such reduction and confirmation, consider the orders as agreed upon not subject to cancellation without mutual agreement.

FIFTH: That in order to hasten the more stable condition desired by both retailer and manufacturers, retailers be asked to sign all orders on which the price is guaranteed, and that such orders be not subject to cancellation, if shipped within the period of price guarantee, except by mutual agreement.

SIXTH: That to do away with the possibility of dissatisfaction because of goods being shipped in a day or two after the change in price, the manufacturers be asked to invoice no goods to a retailer unless said manufacturer has placed in the mail, addressed to said retailer, at least 15 days before the day of shipment of goods, a dated price-list showing the price at which articles are to be invoiced.

Committee of Manufacturers.

The retailers then appointed a committee to report on these proposals and their findings were as follows:

We see nothing in the proposed resolution that solves the real problem of the dealers to-day—

Because—

It is our desire to stabilize business and prices now, and we are here for that purpose and feel that this can only be done by a guaranteeed price on some fair basis.

The present policy of placing orders is unfair to the dealer and, in turn, to the buying public. During the war this evil crept in, and we have permitted it to remain one-and-a-half years after the war; but we believe that we have now reached the point where it should not be tolerated longer.

The placing of orders on an open price has destroyed competition and, consequently, places the retailer at a disadvantage. Many manufacturers in every line are selling on a positive price and filling orders, which proves conclusively that it can be done.

We are told by one of your leading manufacturers in the meeting to-day that this condition will probably continue for twelve months, which assures us of more advances and which we know the public will not stand.

The privilege of cancellation at the eleventh hour is no relief.

Because of the above facts and reasons, we recommend that the proposal from the manufacturers be respectfully declined.

Committee of Retailers.

The retailers then passed the following resolution

covering the discussion,—"It is a sense of this gathering that in the interest of all concerned, we return to our former methods of doing business, and place our orders at a guaranteed price."

Other discussions took place, one centering around the standardization of bed sizes. It was generally agreed that 4 ft. 6 in. x 6 ft. 4 in. was the ideal standard size for a double bed. This question will be discussed later when the bed and bedding associations, some of the larger bedding manufacturers and a number of retailers can be brought together.

The retailers felt that the reduction of patterns and larger and improved manufacturing facilities should have resulted in an increased production without an increase in costs. The furniture manufacturers then offered to produce evidence which would show that the unproductivity of labor is alarming, the men producing only about 70 per cent. of their normal productive ability. In addition, Mayor Bosse stated that the furniture factories were losing hundreds of laborers to other industries, which were amused at the small wages paid by the furniture men. The shortage of workmen has still further curtailed production and the manufacture of phonographs has also reduced the quantity of furniture being turned out.

Uniform terms were under consideration and many dealers felt that on account of transportation delays and slow freights, a cash discount period of thirty days should be allowed on all orders.

The Retailers' Association will meet again in Chicago on June 25th, 1920.

When Planning Your New Factory

Do You Want Just a Building or an Organized Industrial Plant?—How Plans Should be Worked Out—Welfare and Comfort of Employees Important Consideration

By H. M. Marchand

1920 seems to be a year of expansion in the woodworking industry. One hears, on all sides, of new plants and the enlargement of existing operations. At the best the building of a new factory or a factory addition is a costly undertaking, but unless the new building has been planned with due regard to economical operation and the present and future expansion of the business, it may, when finished take a toll of the profits each day it is in operation. In view of this a few remarks on the planning of industrial buildings should not be amiss.

There are few investments that a manufacturer can make today that will tend to lower costs and boost the output as an efficient well-planned industrial organization. It is next to impossible to operate economically in a poorly constructed, badly arranged plant. Faced with a serious labor situation, every advantage should be taken of the latest ideas in plant construction, operation and equipment.

Promiscuous Additions Belong to Past

The past might well be called "the days of hit and miss additions." A plant was handicapped for lack of room, so many square feet of floor space was required. The amount was figured out and an addition attached that would give that badly-needed accomodation. In many instances that was all that it did give, for manufacturing costs under the new conditions were often higher than before. As other additions were tacked on, the subsequent confusion and inefficiency became more marked.

The better method and the one that should be followed in all instances is to work out a detailed plan, not only of the factory itself, but the production system to be used, the necessary equipment and the lay-out of same. If the work planned will only take care of present operations, what of the future? Is the business going to grow? If it is, is not when planning the time to visualize this growth and provide and prepare for future expansion. When this is done each unit of construction, as erected, dovetails into the existing plant and production is carried on under a prearranged plan, continuity of operations is secured and the efficiency of the plant increased with every move. This planning will probably require the services of a trained engineer.

Work From Inside Out

The best industrial engineers insist that production be studied and the lay-out of equipment and departments decided on before the building itself is worked out. In this way the building is made to conform to the product to be manufactured. Thus the proper sequence and continuity of operations is secured. The ideal method is to arrange the equipment and departments so that the work proceeds through in a straight line, every succeeding operation advancing the stock that much nearer the shipping or storeroom. This arrangement saves time, floor space, works for economical manufacturing and in other ways has a marked effect on the operation of the plant.

The choice of the type of building for woodworking usually lies between reinforced concrete and mill construction—brick-wall and heavy, slow-burning interior. As woodworking is usually a sprinkled risk, should be anyway, the mill type or some modification of that form of construction appears to be the most desirable for a furniture or similar plant. Concrete construction usually costs more and as far as the average woodworking factory is concerned, does not offer any marked advantages over mill construction.

Provide Plenty Light

The type of wall should next be considered. The old idea of solid brick walls with small windows has passed into discard. The newer method is to construct walls having brick piers 4 ft. or 5 ft. wide, with windows, usually steel sash, 12 ft. and wider, providing a window area of from 50 per cent. to 75 per cent. of the whole wall. This construction does not increase the building cost to any marked degree. In actual practice it averages about the same. As the greater glass area increases the radiation of heat, the heating plant and system in a building of this kind requires

careful planning. The increase in daylight afforded by the larger glass area tends for high production, decreased artificial lighting bills and contented workmen.

The roof should be fire resistant or, at least, fire retardant. If made of wood, the latter feature is secured by laying a solid 2 in. plank roof, covered with suitable roofing. Many fire-proof materials, such as asbestos slates, slate compositions, concrete slabs with tar and gravel, or other roofing materials, that would provide adequate protection can readily be secured and utilized. Any feature that will tend for lower insurance premiums will prove, through time, a good investment.

The welfare and comfort of the employees should always be considered. Ideal working conditions go hand in hand with contented workmen and maximum production from available equipment. This means that lighting, heating, ventilation and sanitation should always be worked out along the most approved lines. The mechanic of today shows greater discrimination than ever before and usually prefers to work in the plant which provides the best working conditions.

Lack of sufficient manufacturing space and poor arrangement of equipment are not compatable with efficiency and low manufacturing costs. The time to eliminate these undesirable features is when planning an enlargement. In addition, the manufacturer who builds without making due provision for future growth, limits his output, retards his own development and frequently imposes a serious handicap upon his successors.

What I Saw in Southern Producing Area

Lumber Manufacturers Face Serious Situation—Production Far Below Normal—Millmen Bending Every Effort to Increase Cut—Weather Conditions Continue Unfavorable—Walnut Supply Bright Spot

By Harold E. Everley*

One wonders if in the future of the industry there will ever come a time when the furniture manufacturer will experience the same difficulty of production and the same demand for his product as he is now experiencing. While he is putting forth every effort to produce more goods to fill a great and increasing need for his line, he is being harassed almost constantly by the multiplying demand of labor and the perplexing problems of obtaining an adequate supply of materials to carry on his business. The matter of finding a sufficient quantity of lumber to keep the factory going is a problem now faced by some of the furniture manufacturers.

The lumber mills located in the low lands of southeastern Missouri, part of Tennessee and Arkansas, Louisiana, Alabama, Texas and Mississippi produce approximately 80 per cent. of the total gum manufactured and nearly 30 per cent. of all the oak cut in the country. Conditions as they may exist here offer a key to the present situation surrounding the manufacture and supply of available gum and oak lumber and hence influence the market. The three states—Arkansas, Mississipppi and Louisiana—together produce approximately 68 per cent. of the total gum cut, hence any disturbance in the hardwood production of these districts greatly affects the supply of gum lumber.

Some Difficulties Encountered

There are reasons why the southern producers are unable to increase their low stocks of lumber. Undoubtedly the most important of these is the effect of the unfavorable weather conditions which have prevailed over most of the south since the fall of 1918. On the low lands the woods were in very bad logging condition when the worst rains came in October, 1919, and have continued almost incessantly since that date, making the forests impassable and lumber operations over a very large part of the low, flat territory were discontinued.

Together with the unfavorable climatic conditions came the difficulty of obtaining plenty of hands to get out the logs. It is said that more than 150,000 colored laborers left the south during the war. Those remaining were, in many cases, an inexperienced class which has not improved very much. It is claimed on good authority that the present class of labor, which is largely colored in the southern hardwood territory, is only 75 per cent. as efficient as that to be had previous to the war. Great numbers of men, who formerly worked in the lumber industry, did not return at the close of the war, which left the mills without sufficient amount of trained help at the time when production of lumber was needed to be greatly increased.

Showing result of excessive rains in southern district

Another very serious evil of the present time, which is retarding the production of lumber throughout the south and causing great difficulty in getting available stocks to the market, is the present shortage of cars. This condition is not a temporary one, and the lumber industry is face to face with what is unquestionably going to be a serious problem. It is the opinion of well-known transportation men and railroad officials that there will be no relief from the present situa-

*Extracts from report of investigation made for National Council of Furniture Associations.

tion during the year. The car shortage is due to the lack of available equipment which does not exist. Cars cannot be had owing to the fact that there is neither material, labor, nor money available to build them. In this period of unusual industrial and commercial activity, the car shortage is severely felt, and, as there are virtually no new cars being built, the shortage will gradually increase until such time as car construction is again under way. Unless relief is speedily to be obtained the shortage of lumber available for the manufacture of furniture and other products made of wood will continue to be one of the perplexing problems.

Weather Conditions Governing Factor

According to the latest reports and the writer's observations, the production of lumber in the three adjoining districts, Memphis, Arkansas and South Wester, producing largely gum and oak, is at present operating at 45 to 50 per cent. of the cut obtained at this time during a normal year. In some sections of the south it is hoped that an increased output will follow

Showing efforts that are being made to maintain production

the advent of favorable weather conditions and this will tend to help produce an easier market situation. However, it must be remembered in this connection that a heavier production will no doubt be accompanied by a corresponding expansion of demand for lumber that cannot be much longer deferred.

The rapidly waning supply of logs on hand at the mills together with the present logging difficulties over a large portion of the southern territory is being reflected in the present condition of the unsold lumber stocks, both green and dry, which now total approximately 27 per cent. of what they should be at this time in normal years.

Walnut Supply Adequate

Considering that the present stand of walnut timber in the United States at present is approximately one billion feet (government estimates) and that the annual cut based on the 1920 production, which is estimated to reach fifty million feet, the present stand of walnut timber will last for fifteen to twenty years. During that period there will be thousands of trees which will become merchantable each year, thus adding to the total supply. This stand of walnut can be very materially extended by the greater use of veneers. The ratio of one inch lumber to veneer is 1 to 20, which gives a wide field for prolonging the supply of walnut, in spite of the fact that many walnut logs are not suitable for veneer purposes.

The domestic consumption of walnut between the years of 1850 and 1875 was heavy. From the latter date up to 1900 the home consumption had decreased materially. The demand of foreign markets has since very largely taken its place and has continued to grow until just preceding the war when it is estimated that at least 85 to 90 per cent. of the walnut lumber and logs cut in this country was exported. England and Germany were the principal customers.

Amount of Export Controls Situation

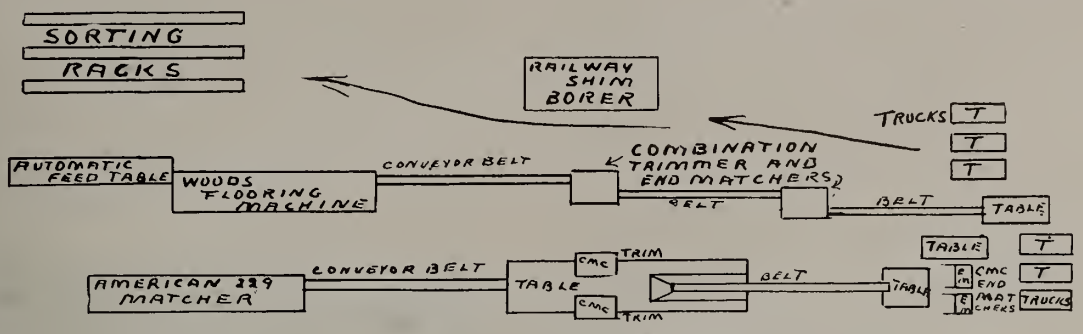
If it be kept in mind that in past years more than three-quarters of all the walnut lumber produced in this country, which annually amounted on an average to fifty million feet, were exported without apparently affecting the supply of the furniture industry, it does not appear that there need be a shortage of this lumber for the present. On the contrary, now that very little of this wood is being exported, there should be plenty of walnut available. An inspection of some mills seems to prove this supposition for they have several million feet of walnut in logs and lumber in stock. Every indication is that there should be no difficulty in obtaining a sufficient amount of good walnut lumber to care for the present and immediate future needs of the furniture industry.

The lumbering conditions around Asheville, North Carolina and eastern part of Tennessee are more encouraging. The production of lumber in this part of the country is now about 75 to 80 per cent. of that in normal times. Up to recently the shortage of labor affected lumber production considerably. With the coming of warm weather there seems to be more help available and the present indications in this territory are that there will soon be more lumber produced than during the winter months.

Every Effort For Greater Production

Just what the immediate future prospects will be for a relief from the present lumber shortage conditions found in the southern territory, no one can accurately tell. The possibility of increasing production depends mainly upon future weather conditions throughout the south. Usually the spring weather in that part of the country is favorable for increased log hauling and lumber cutting. If this be true this spring, another month or two will find the timber and logging crews again busy making preparations to begin heavy operations on all but the flatest lands. For the present, it may be considered that the lowest ebb of lumber production possibly has been reached in that territory covered by the investigation up to date. However, mill owners are putting forth every effort to increase production and there are hundreds of small mills springing up, which will tend to increase the available supply of lumber. The general outlook for improvement in the hardwood territory outside of the lowlands is very optimistic.

In general, it may be said there has not been, nor is there at present, insofar as is present, any effort to voluntarily limit or otherwise influence production, thereby increasing the shortage of lumber for the purpose of inflating prices. On the contrary, great efforts have been and are now being put forth to increase the supply of available lumber because of the insistent demand and the attractive prices.



Layout of hardwood flooring equipment and conveyor belts in Midland Wood Products factory

Quality Maintained in Midland Plant

Newest Ideas Adopted to Hardwood Flooring Production—Well Equipped Sash and Door Departments—Rust Proof Screens and Other Special Order Work

Anyone who has visited Midland, Ont., recently and walked down the track past the large grain elevator could not have failed to notice the factory of the Midland Wood Products, Limited. The modern plant is housed in a compact brick structure and is equipped with up-to-date labor-saving machines.

Probably one of the most interesting operations performed is the manufacture of hardwood flooring. Various widths and thicknesses are produced in such hardwoods as oak, birch, beech and maple. Some of the very latest equipment has been installed and an effort made to keep the manufacturing costs down to a minimum.

Lumber Stored on Trucks

The hardwood lumber is loaded directly from the railway cars to kiln trucks and either placed in the kiln or on a storage track where it stands until required. The capacity of the kiln is 125,000 ft. The storage track holds the same amount so that a quarter of a million feet may be handled on kiln trucks. After being dried the lumber is sorted and run into the factory.

The ripping is done on a Yates band resaw and a C. M. C. power feed rip. This latter machine is equipped with two saws and rips two lengths at a time, making for greater production. The stock for the thin flooring is taken and split on a Yates resaw.

The shape of the building and the layout of other machines is such that the flooring equipment could not be placed so that the work would proceed through in a straight line. This necessitates that trucks be used to move the stock for certain operations. It is possible that some form of an overhead carrer system could be used to advantage in moving this work. A very efficient installation of conveyor belts carries the flooring from the stickers to the trim saws and matchers and from there to the grading tables.

Flooring Handled to Advantage

The thin flooring is run on an American No. 229 hardwood flooring matcher. This machine is doing good work and producing a satisfactory quantity of well manufactured stock. The material falls on a conveyor belt which carries it to two C. M. C. trim saws. From here another belt conveys it to the C. M. C. end matchers. After being matched it is graded and taken to the sorting and tying racks.

The heavier stock is manufactured on an S. A. Wood's hardwood flooring machine. This machine is fitted with an automatic feeding table which carrys the pieces to the feed rolls. Using a feeding table enables the matcher to be worked to capacity and gives the operator a chance to feed his stock to the best advantage. A conveyor belt carries the work to a

American No. 229, running hardwood flooring in Midland plant

Sherman combination trimmer and end matcher which trims and matches one end and drops it on a belt which carries it to another combination matcher which trims and matches the other end. The work again drops on a belt and is conveyed to the grading table and goes from there to the sorting racks.

The finished flooring is stored in a heated warehouse. This building, in fact the whole factory, is equipped with an automatic sprinkler system. An adding machine is employed to check and keep accurate track of the bundle lengths as the flooring is loaded out.

The balance of the equipment on the main floor consists of an Yates double surfacer, a Preston power rip saw and a number of S. A. Wood's matchers. The

largest matcher is fitted with an automatic feeding table similar to the flooring machine. These machines take care of the general mill work and milling in transit.

The sash and doors are manufactured on the second floor. The stock is dressed and ripped before being taken up in a large elevator. The equipment here is modern and up-to-date in every respect. The sash making machines include a Cowan mortiser, Cowan tenoner, Cowan sash sticker, Cowan hollow chisel mortiser and a C. M. C. trim saw. A full line of stock sashes are manufactured as well as special order work.

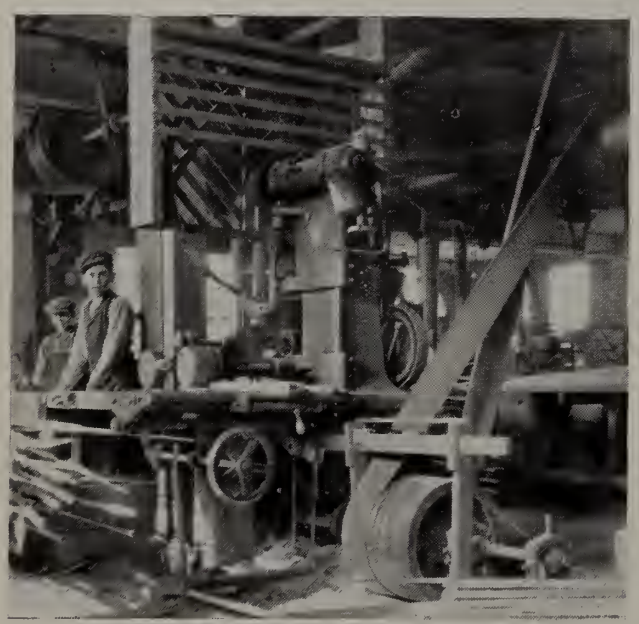
Efficient Door Making Equipment

The greater proportion of the door making equipment consists of efficient automatic and semi-automatic machines manufactured by the E. B. Hayes Co., now the Jenkins Machine Co., Sheboygan, Wis. This equipment includes such items as power door clamp, dowel sticker, dowel pointer and trimmer, dowel driver, multiple spindle boring machine, glue tank with special automatic gluing attachment, double tenoner, Hall & Brown panel raiser, Yates three drum sander, Mattison belt sander, Whitney planer, American band saw, Preston buzz planer, Cowan variety shaper, etc.

The quality of the doors is kept up to a very high standard consequently there is a considerable amount of material culled out when cutting out the door stock. This lumber is utilized in core-stock for the veneered doors. It is built up in pieces about 5 in. by 5 in. of a suitable length for a stile and then squared up and resawed into three stiles. These are dressed on two sides and are then ready for veneering.

Waterproof Glue Employed

In the veneering department, where the stock and panels for the veneered doors are laid, Napco waterproof glue is used entirely. One of the accompanying



"Yates" band rip used for sawing oak and other hardwoods

illustrations show the Francis spreader which is used for spreading the Napco glue. This glue has proved to be very satisfactory for this work and the absence of heat and odor in the glue room being a very desirable feature.

Another product of this company is a line of special made-to-order wire screens. These are very high-class and are made to last, consequently the best of material is used and the frames are strongly made, a mortise and tenon joint being employed. The screen wire, which is forced in a groove and a small dowel pressed on top of it then covered by a moulding, is of bronze and is therefore rustproof. The screens should last as long as the house to which they are attached.

A well-equipped finishing room has been provided to take care of the enamelling and painting of the

Francis glue spreader working on "Napco" waterproof glue in Midland factory

screens and other special order work. Skilled finishers are employed to handle this end of the work.

Mr. Bray, the manager, is a crank on quality and keeps a watchful eye on the various lines produced. He believes that the output of any plant should be made up to a standard rather than down to a price and maintains that the users of wood products appreciate quality and dependability. The fact that the Midland Wood Products plant is running to capacity and at that is unable to fill all the orders coming in would seem to bear out his contention.

Sawdust for Domestic Heating

The search for a fuel cheaper than coal or gas has turned the attention of investors to sawdust, and there are now being introduced in Britain special heating stoves which are designed for burning that waste product of the sawmill. The pattern is made in three sizes, respectively to burn six, twelve, twenty-four hours.

It is cylindrical in shape, stands on three feet, and has two principal chambers, that for the fuel in the centre, with an annular space for hot gases round it, the latter discharging into a bent elbow, which is provided to connect with a chimney. In the base is an air chamber, which is controlled by a damper, and the whole thing stands in a tray. To start the stove a core-stick is set upon in the bottom, round which the sawdust is rammed, and then it is withdrawn. This forms a centre flue, at the bottom of which is placed a little bit of cotton waste soaked in petroleum. When lighted this starts the combustion, which continues from the centre until the charge is burned.

Do You Guess At Your Cost Figures?

Averages Based On Past Costs Form Valuable Guide—Tables Showing Application Average Cost Tables to Newels, Columns and Mouldings

By S. J. Sutherland

(Second of series)

There have been a great many articles and books published at one time or another on woodworking estimating systems. Of these the most modern, and in the writer's opinion in the most complete and of most service to the manufacturer of odd job work, are the Mill-work Cost Information Bureau of Chicago, and the complete Odd Work Price List. This latter book is, probably, the most complete of its kind and, while the prices contained in it pertain to normal times, each item of work relating to the particular job is estimated so that with the advance of prices, these estimates can be changed; for example:—

Stair Newels

Mitred Cap and Neck Mould

1914

		W. Pine	Y. Pine	Birch	P. Oak & Ash	Quarter Cut Oak
5 x 5	-4	88	1.75	2.00	2.50	2.75
	5	110	1.75	2.00	2.50	3.00

Half newels 2/3 of whole.						

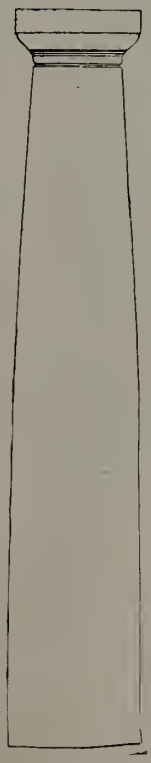
Another table shown is a chart in reference to special built-up columns. It must be borne in mind that the prices shown are those which applied in 1914, and the readers of this article will have to use their own judgment as to the prices to make on each of the operations shown in the list so as to meet conditions as existing to-day. The one disadvantage of using a price book is that with ever-varying changes in value, both of material and labor, one is apt to make the same old mistake of guessing at different operations without investigating costs.



Details of Column Costs 1914

Diam.	6/4 per ft.	8/4 per ft.	10/4 per ft.	12/4 per ft.	Base	Cap	Neck	Plug	Fluting	Weights Cap lbs.	Weights Base lbs.

Priming, 10c per sq. yd. surface.
Weight of shaft, number of sq. ft. by 1½ lbs. If fluted sq. ft. by 1-1/3 lbs.

From a great number of statistics submitted, the Millwork Cost Information Bureau has compiled the following figures as regards the manufacture of mouldings. Prices of material, labor, overhead, etc., to be figured as per f.o.b. the manufacturer's own plant. Figures based on 1914 costs.

In speaking of the advantages of the accurate knowledge of costs, one is often met with the argument that the selling price is, after all, based upon the market made by other sellers, and that no manufacturer can exercise any control over the price. This argument is, of course, ridiculous, for in the long run the cost of production, plus a profit, must be recovered in any industry, and the sooner the real cost is known, the sooner will prices find their true economic level. Moreover the man, who knows his costs first, will be the one to profit most by this knowledge.

The retail planing mill men of Toronto, working along similar lines, have compiled the following price lists, which are in such form as to allow rapid and accurate estimating, where mouldings of several different woods are used on the same bill of material.

Reference Schedule—Moulding Cost

As quoted before "A modern shop must be more or less a schoolhouse, and in it the manager musts be one of the pupils," and so in regard to modern estimating. The Millwork Cost Information Bureau can certainly be of assistance to every odd work manufacturer, be he large or small. For the surest way to prevent any article being held for sale at an economically unsound price is to have reliable data regarding its cost most widely disseminated. This was the purpose for which the Millwork Cost Information Bureau was first created. In addition to actual expenditures, their system allows for interest on capital used at 6 per cent. If the turnover is three times per year, this only amounts to 2 per cent. of sales. It also allows for depreciation on buildings and equipment. If proper depreciation has been allowed prior to installing a cost system, or if buildings and equipment are new, they allow the following amounts per year: 3 per cent. on brick buildings,.5 per cent. on wood buildings, 10 per cent. on equipment.

Any method of distributing expenses to individual orders or operations that accounts for every item of expense incurred in the running of a business is worthy of much respect. On the other hand, no matter how fair the distribution may be to the various classes of product, a system that does not account for every dollar spent is very misleading and, therefore, a dangerous proposition.

The Scientific Kiln Drying of Lumber

Suitable Drying Conditions Worked Out in Advance - Successfully Reproducing and Controlling Drying Factors—Following Predetermined Drying Schedule—Intelligent Operation Essential

Written especially for the Canadian Woodworker

The best way of which I know to prejudice the average man in the lumber and woodworking trades against anything is to tell him that it is scientific. To him the word means impractical and therefore of no use in his business. Quite often he is more nearly correct than he knows, since much scientific work has no immediate application in industry. However, it must not be forgotten that all progress in industry is based upon science, which may be defined loosely as "classified knowledge" or "organized common sense."

Among the great industries which have benefited greatly from the application of scientific knowledge may be mentioned all the chemical industries, the portland cement industry, the steel industry and all industries dependent upon steel or alloys, and practically all industries having to do with the production of food of all kinds. These are only a few samples—there is hardly an industry today which does not owe much of its progress to science in one form or another.

Reproduction of Satisfactory Conditions

In many of its industrial applications, possibly in the majority of them, science presents itself in extremely simple form, and the application consists almost entirely in the reproduction, time and again, of various given conditions which science has determined to be suitable for the production of certain results.

The commercial application of scientific kiln drying is, to all intents and purposes, as simples as this; and its success depends largely upon the ability of the kiln and the operator to reproduce certain conditions which have been worked out for him beforehand and are known to produce the desired results. In addition, the operator must know how to make moisture determinations on wood samples, so that he may know what conditions to use and when the material is ready to come out of the kiln.

Scientific kiln-drying is just as simple as any other kind, and the underlying principles are exactly those involved in the air-drying of wood or, for that matter, in the drying of clothes and surely there is nothing in the latter which smacks of impractical scientific research or which daunts the good housewife to the extent of making her put the clothes away wet or "improperly seasoned," as the wood worker would say.

A moment's thought will make it clear that there are three atmospheric factors which influence the drying of clothes: the amount of sun, the dryness of the air, and the amount of wind. We all know that clothes dry fastest on a warm, dry, windy day. Likewise, lumber air-seasons fastest under similar conditions. Sometimes, however, it may be too hot, dry, and windy, with resulting injury to the lumber. The science of kiln-drying consists principally in maintaining in the kiln those conditions of heat, dryness and wind which produce the intended. In speaking of these three variables we usually call the degree of heat "temperature," speak of the degree of dryness of the air as "humidity" (the greater the humidity, the damper the air) and the amount of wind we think of in terms of "circulation," usually expressed in feet per minute, instead of in miles per hour as is customary in weather reports. Our three factors are then, in kiln-drying terms, "temperature," "humidity" and "circulation"; they are still, of course, our same old friends which determine whether or not our clothes are going to be dry before evening.

Now that we understand what it really is that determine the rate of drying, it remains to find out how much of each is needed for best results. Here is where the industrial research of the Forest Products Laboratory, at Madison, Wis., shows us the way. The laboratory has been working upon these problems for many years and has made a great many experimental kiln runs upon various kinds of wood, intended for all different uses.s These experimental kiln runs have been checked time and again in actual practice and the drying schedules proven satisfactory.

Using Predetermined Drying Schedule

A drying schedule is a chart or table which tells what temperature and what humidity to use under certain conditions of drying, and how to change the temperature and humidity as the drying proceeds. A number of these schedules have been published from time to time and others are constantly being added to the list. Copies of those available can be secured free of charge by writing to the laboratory.

In order to produce successful drying it is essential that the dry kilns be suited to the work which they are

to do. This means that they must be able to produce the conditions of temperature and humidity specified on the drying schedule and maintain them within the limits of accuracy demanded. To maintain these conditions properly it is essential that there be ample air circulation throughout all portions of the kiln. For certain classes of kiln-drying, such as the drying of heavy vehicle stock green from the saw, the drying schedule is such that the humidity in particular must be accurately controlled, and it is necessary to have a very accurate means of control and a very high rate of air circulation. On the other hand, in the drying of inch lumber of many coniferous species, such as the pines and spruces, the degree of regulation need not be nearly so great, and the high temperatures which are used make it comparatively easy to secure a fairly good circulation of air. To put the matter in another way, the kilns for the vehicle stock must be of higher grade, from the standpoint of control, than those for the 1-inch pine or spruce boards.

Type of Kiln Factor

There is another consideration which has a profound influence upon the drying schedule and type of kiln to be used, and that is the use to which the material is to be put. This phase of the subject received very little attention until it became necessary to kiln-dry wood intended for aircraft construction. It is essential for this use, that every bit of strength available be retained, and it is not possible to dry the stock as rapidly as would be the case if it were to be used for ordinary purposes, such as furniture manufacture or building construction, where a small loss in strength is of no moment.

The Forest Products Laboratory has made many thousand tests upon various species of wood to determine the effect of kiln-drying upon the strength and has developed drying schedules by which these species can be dried without injury. It is interesting to note that too rapid drying, either in the open air or in the kiln, may have caused considerable injury, even though there be no visible defects, such as checks, warping or cupping.

In order to carry on "scientific kiln-drying" it is necessary, then, to have suitable kilns, proper drying schedules, and an operator skillful enough to keep the kilns in running order and to make the drying follow the predetermined schedule.

Band Resaw Effects Large Saving

Operator Finds This Machine Very Advantageous—Handles Wide Range of Work—Lumber Saving Amounts to Ten Per Cent.—Tends to Increase Production

By Mark Foster

A furniture concern manufacturing a complete line of popular priced furniture and cutting several million feet of lumber yearly recently decided to replace the circular resawing outfit they were using with a modern band resaw. They figured that the saving in time and waste that the band machine would effect would more than pay for the new installation.

Two men operate the band resaw, the same as with the circular saw, so the labor expense of operating the new machine is no greater. In fact, it is really less, for the band machine handles all the resawing for the day in six or seven hours and the remainder of the time it is kept busy on work that really comes under the head of ripping. An instance of this: planks are ripped 4 inches wide on a rip saw and then cut into 2 inch square strips for chair leg stock by running through the resaw once. The resaw does the work as accurately, and even more quickly, than the rip saw, so in extending its operations in this way, it works out very advantageously.

Ten Per Cent. Lumber Saving

The band resaw carries 19 and 20 gauge saws, and the saving in kerf alone over the old circular machine exceeds 10 per cent. In other words, 10 per cent. more lumber is being saved. The saving in dollars and cents effected thereby may be easily figured. In view of these figures, which show how advantageously the band resaw may be used in the factory, the thought naturally dominates: "Why are not more furniture manufacturers using band resaws?"

The reason is probably because the average furniture manufacturer feels that he wouldn't have sufficient work to keep a band resaw busy all the time, and therefore the machine would not prove a profitable investment. How wrong this view is, is shown in the above instance, which is exceptional only in the sense that as yet only the more progressive concerns are using band resaws on their work.

In the past few years lumber has steadily increased in price because of its growing scarcity and necessity of conducting logging operations under most inconvenient conditions to obtain the better grades necessary in furniture work, which naturally adds to the expense of such operations. All branches of woodworking have felt the effects of advanced lumber prices, but no branch of the industry has felt it so keenly as the furniture makers.

Employ Most Efficient Machines

This condition has made it necessary for furniture manufacturers to employ the most efficient manufacturing methods. The only source open to them to offset the high price of their material and the comparatively low price their commodity commands is to control their manufacturing costs to the greatest extent possible.

It is vitally necessary for furniture manufacturers to eliminate every condition in their plants that makes for waste or needless expense. Therefore, every furniture manufacturing concern that has resawing to do, if only a few thousand feet daily, should handle the work on a band machine. The band resaw holds out an opportunity to cut down expense and waste. All woodworkers should be alive to every such opportunity that presents itself, and should thoroughly investigate its economic possibilities.

If furniture concerns in general are willing to profit by the economical and waste-saving methods worked out by the more progressive men engaged in the industry, it is a conservative prediction that within a year or so the band resaw will be considered as much a furniture factory tool as the sander or surfacer.

Box Manufacturers Gather in Chicago

Situation in Industry Reviewed—Figures on Lumber Market—Trade Promotion and Publicity Campaigns Decided on

The National Association of Box Manufacturers recently held their 21st annual convention in Chicago. This was a most successful affair, not only in view of the number in attendance but considering the broad attitude and co-operative spirit displayed by the gathering as a whole.

In the opening address Chairman B. F. Masters gave an interesting review of the box industry, touching on many points of vital importance. A few extracts from this address follow: "There never has been a time in the history of the world when future events could be forecast with so much uncertainty and so little exactness as today, because we have been passing through conditions that the world never knew before.

Production is Our Great Need

"I dare say if I were to ask you gentlemen the greatests problem that rests upon your minds today it would be unanimous that it is the question of production. Nobody has any difficulty in selling their product today; if we have it's their own fault. And anybody who sells his product to-day at a sacrifice does it because he does not know the possibilities of the industry in which he is engaged. I say that without any equivocation or modification. There never has been a time when our product and the manufactured products of the United States could be sold and can be sold with so little difficulty and with so little fear of competition and with so little regard for the adjustment of your prices to meet competition as today. The great problem is to produce the products yourselves.

Service Keynote of Industry

"Then, too, our industry is peculiar. We cannot base our operations upon the same plan that the manufacturer of 90 per cent. of the commodities of the country does. We can't manufacture our products and put it in stock and hold it until the time is ripe for marketing to the best advantage. In that respect we are different from practically all the manufacturing interests of the country and yet our work is as broad in its scope as all of these interests combined because we serve them all.

"But with all this service we can only manufacture our product after it is ordered. We make our goods to order. We must have the orders first. Therefore, we have deeper and graver problems to meet than the manufacturers of standard and staple lines, who manufacture their product and place it on their shelves or in their warehouses, awaiting the best market conditions before they sell it. We must always maintain a capacity to serve our trade and serve it quickly.

Securing Full Replacement Value

"I am of the firm conviction that anybody is quite justified in basing their selling price on the reproductive value of the lumber, and the strongest reason for that is that when we reach the peak and when the pendulum begins to swing the other way you are going to have a great deal of lumber on your hands that cost you a great deal more money than you can get out of it in the shape of boxes, and you will have to absorb some of the profit that you have made in the meantime (if you have been fortunate enough to make any). The other side of the proposition is as inevitable as the fact that we recognize there must be a period of reconstruction when values go the other way. I am not prepared to say when that will be, but I quite share the opinion that people express freely that some day we will see a basis of values lower on all staple commodities than we see today.

"I see no indication at present to effect a hasty approach of that condition, but when it comes you will sell your product not upon the basis of what it cost you but upon the basis of reproductive value. You will be forced to do it when it goes the other way. Why not equalize the thing by adopting the same rule and same plan in connection with the selling of your product today?"

Mr. Martin then paid tribute to the achievements of W. D. Burr, as secretary and suggested that all members give him their fullest support and heartiest co-operation. He concluded by saying: "I bespeak for this association that the next twenty years will lead us out into greater and broader visions of unity and will cement us more closely together and work more to the interests of our industry than even the past twenty years have done. That is my wish to you."

The Address of the Secretary

The secretary, W. D. Burr, in his report touched on the activities of the association and its branches. In outlining the lumber market he said.

"I want to direct your attention to a few figures. Figures are sometimes interesting, even in a burlesque show. The lumber production rose from 18 billion feet in 1879, to 23 billion feet in 1889, to 35 billion feet in 1899 and to 43 billion feet in 1904. In 1912, 45 billion feet were produced. Government figures for that year indicate that between four and one-half and five billion feet of lumber were consumed in the manufacture of boxes, or about 11 per cent. of the total production. I believe the Government estimate is somewhat less than the actual. Since 1912 the annual production of lumber has decreased. The total production in 1918 was 32 billion feet, in 1919 about 28 billion feet. If the lumber consumed by the wooden box industry has not decreased since 1912, it represented last year about 17 per cent. of the total lumber consumed. What of the future? Can the consumption of lumber by the wooden box industry increase in proportion to the normal increase in demand for containers? A decreased production of lumber means a decrease in the lower grades. It means higher prices for all grades. Higher prices in turn will bring about a demand for some of the lower grades for purposes other than the manufacture of boxes. If there is to be a shortage of box lumber, either the number of wooden boxes used must be decreased or boxes must be made of less material.

Demand for Fibre Containers

"Now let us consider the paper box situation. The corrugated and fibre box industry has shown a remarkable growth, as the following will indicate. In 1914 there were 84 corrugated box plants and 35 solid

fibre plants in operation. Today there are 122 corrugated box plants and 66 solid fibre plants. Of those existing in 1914 but one has been dismantled. These figures alone do not indicate the increased production, for many of the older plants have been expanded and more modern machinery has been installed. The average speed of corrugators and pasters has been perhaps doubled in the last six years. It is estimated that production has increased about 150 per cent.

"The paper box makers are extensively advertising the saving in transportation costs of their product as compared with containers—which condition will be further emphasized by an increase in freight rates. Laboratory tests indicate that the predominating cause of failures of wooden boxes is not the use of material of insufficient thickness, but faulty design, careless construction and too few nails.

"We must urge the use of better containers; we must educate the public to realize the best is the cheapest in the long run. We must make investigation in an effort to develop boxes which without sacrificing strength or serviceability, may be constructed from less lumber. I am convinced that in a great many cases, by improved design, increased nailing and the use of reinforcements in the form of cleats and metal straps, many boxes may be made with a substantial saving of wood and consequently of cost."

Mr. Burr also touched on standardization, cost accounting and distribution.

Many other interesting addresses were presented including a report on "Standardization" by D. L. Irwin (Chicago Mill & Lumber Co.) of the standardization committee; report on testing shoe boxes by J. A. Newlin, Forests Products Laboratory, Madison, Wis.; "Trade Promotion" by Murray Springer and the reports of the secretaries of the different branches.

Increasing Life of Sand Belts

The woodworking industry is getting some new light on sanding panels and other woodwork to get a smooth finish. The new light consists in the fact that lighter pressure and higher speed bring better results.

Whether sand drums or sand belts are used, much pressure results in battering the wood. This is especially noticeable when the sandpaper becomes slick or dull, which may result either from filling with dust or from the sharp corners of the sand wearing off against the wood. To insure cutting that is free and sharp and a good finished surface all sandpaper used must be sharp and clean. With lighter presure the sand will run longer before becoming dull, and if slick it will cut more freely even when it is dull, so the tendency is strongly towards high speed and light pressure on all sanding devices. Speeds may vary from 1,000 feet of travel a minute up to 3,000 or 4,000 on sanding belts, while on drum sanders and disc sanders almost any speed imaginable can be encountered.

So far as the cutting qualities of the sand is concerned, no speed limit has yet been attained. Sand belts and sand drums may be driven to whatever speed they will stand without damage or distortion; it is these mechanical things which really limit the speed in sanding. Efforts are largely centered on developing sanders and sand belts well balanced, with higher speed, to the end that there may be cleaner cutting with lighter pressure. This is a point to be kept in mind in selecting new equipment for sanding.

Fuel Value of Different Woods

Two pounds of dry wood of any non-resinous species have about as much heating value as a pound of good coal. Speaking in tons and cords, a ton of coal may be taken as the equivalent in heating value of 1 cord of heavy wood, 1½ cords of medium-weight wood, or 2 cords of light wood.

The following table is an approximation of the number of cords of seasoned wood of various kinds needed to give the same amount of heat as a ton of coal, on the basis of 80 cubic feet of wood, with a moisture content of 15-20 per cent. to the cord:

1	cord	Hickory, Oak, Beech, Birch, Hard Maple, Ash, Locust, Longleaf Pine, Cherry	=1 ton coal
1½	cords	Shortleaf Pine, Western Hemlock, Red Gum, Douglas Fir, Sycamore, Soft Maple	=1 ton coal
2	cords	Cedar, Redwood, Poplar, Catalpa, Cypress, Basswood, Spruce, White Pine	=1 ton coal

Resin gives twice as much heat as wood, weight for weight. Hence such woods as the pines and firs have more heating power per ton than non-resinous woods. The resinous woods in the table are considered as having an average amount of resin (15 per cent.).

The fuel value of wood depends in many cases not alone upon its heating power, but also upon such qualities as easy ignition, rapid burning, freedom from smoke, and uniform heat. As a rule soft woods burn more readily than hard woods, and light woods more readily than heavy woods. The pines give a quicker, hotter fire and are consumed in a shorter time than birch; where as birch gives a more intense flame than oak. On the other hand, oak gives a very steady heat.

Government Regulation of Fruit Box Sizes

It is probable that legislation will be enacted by this session of the Dominion Parliament which will amend the Inspection and Sale Act. The proposal is to amend this act so as to prescribe the quality, form, dimensions and capacity of all containers in which fruit shall be packed and the materials of which such containers shall be made; to prescribe the kinds of fruit subject to the regulations and to prescribe penalties for violations of such regulations.

Wages in Belgian Industry

In the plate glass industry of Belgium wages average about 125 per cent. greater than those prevailing prior to the war. The output is limited and is being sold at very high prices. The United States is expected to be again a desirable outlet for this product as soon as larger supplies of raw materials enable production to be increased.

New Parry Sound Company

The Parry Sound Forest Products, Limited, Parry Sound, Ont., who were recently incorporated, have purchased suitable premises from the Parry Sound Lumber Co. and propose manufacturing a line of sash, kitchen tables, clothes reels and other similar lines. They expect eventually to manufacture a complete line of furniture and will train help toward that end.

Robert Lyons, Parry Sound, Ont.

A resaw and other equipment is being installed to handle milling in transit. In addition to the lines mentioned the company have several patent toys, of their own design, that they will work on and are prepared to tackle anything that offers scope for development.

Robert Lyons, the managing director has had a wide woodworking experience and an extended insight into factory methods and systems. Born in Ayrshire, Scotland, in 1884, he started to serve an apprenticeship at the age of 16, after which he spent three years in office work. In 1906 he came to Canada and was for five years with Shearer, Brown & Wills and Henry Morgan Co., Montreal, in sash, doors, interior fittings and cabinet work. Later he occupied the position of foreman for leading firms in Montreal and Toronto and was for a long period general foreman for the C. X. L.—British Cordite and U. S. A.—T. N. T. plant at Nobel. Mr. Lyons bought the Parry Sound Turning factory in 1918.

Training Course at Forest Products Laboratory

Nearly two dozen representatives of prominent furniture concerns attended the training courses in kiln drying and in the handling of glues and plywood which were given April 12 to 23 at the Forest Products Laboratory, Madison, Wis. In keeping with the purpose of the laboratory to make these courses practical in every respect, the work required was all of a nature to familiarize the students with the structure and characteristics of furniture woods. Problems which are causing trouble in many furniture factories were presented, and solved as far as possible by the application of facts discovered in the industrial research work of the laboratory.

Under the supervision of laboratory specialists, the group of men in the kiln drying course undertook an experimental kiln run on 4/4 green plain sawed oak. This work brought up for discussion innumerable fine points of kiln operation, such as the use of apparatus for regulating temperature, humidity and circulation in the kiln, and methods for preventing checking, case-hardening, and warping. An inspection trip to a neighboring city afforded the class an opportunity to see two large installations of kilns drying heavy vehicle stock on a commercial scale.

In the glue and plywood course the best ways of mixing and applying casein, vegetable, and animal glues were demonstrated. Plywood panels were constructed by the class and subjected to various tests to determine the effect of different manufacturing conditions.

The latter part of each course was given over to special conferences on individual problems which the men had brought to the laboratory for discussion.

In view of the surplus number of applications for enrollment in the kiln-drying course, the laboratory is arranging to give it monthly, beginning in July. Other courses suited to the needs of various industries are also planned.

Furniture Men Enjoy Balmy South

The accompanying picture shows a number of well known furniture manufacturers who, with a party of ten others, are touring the Southern States. The snap was taken while on a trip to the Imperial Valley of

Having a gay time in sunny south

Southern California. The wording of the hotel would seem to indicate that they had wandered across the Mexican border. Such a sturdy "bunch" would not fear the Mexican revolutionists. From the right they are: D. M. Wright, Stratford; S. M. Smyth, Stratford; G. H. Aletter, Montreal; A. O. Smyth, Strathroy, and C. E. and J. E. Jacques, Kitchener.

A gallon of expensive oil poured into the stopped-up hole of a bearing does not have so much effect as a drop of cheap oil in a bearing with its hole free from obstructions.

New B.C. Lumber Commissioner

Lieut. Loren L. Brown, M. C., superintendent of the Dominion Forests Products Laboratory, attached to the University of British Columbia, has been appointed British Columbia Lumber Commissioner for Eastern Canada, with headquarters at Toronto, in succession to Major Brechin, who recently resigned the position.

Mr. Brown will carry on the work which has been for some years past conducted by the Forest Branch of the Provincial Department of Lands in lumber trade extensions in Eastern Canada, a work which has been productive of excellent results in popularizing British Columbia lumber in that large market.

During the war the Toronto office was kept in operation through conditions mitigated somewhat against the development of trade in that section of the Dominion, but now that the war is over, the work will be prosecuted with greater vigor and the success attained in the past in bringing before the Eastern manufacturer and builder the merits of the various woods of this province will, undoubtedly, be further accentuated.

Mr. Brown has both a practical and technical knowledge of the lumber industry and building trades. He is a graduate civil engineer possessing the degree of B. Sc., and an associate member of the Engineering Institute of Canada. In addition to having made a special study of British Columbia woods, he has had practical experience in the lumber mills, and for some time under the former Government was superintendent of important building construction in the province.

Mr. Brown was attending McGill University, Montreal, when the war broke out, and enlisted as a private at Montreal on May 29th, 1915, arriving in France in September of that year. There he transferred to the Canadian Engineers, and for his excellent work he was given a commission in May, 1916. In June of the following year he was awarded the Military Cross for his work with the First Canadian Engineers.

Acquires New Refractory Plant

The Carborundum Company, of Niagara Falls, N. Y., recently acquired from the Alien Property Custodian the plant formerly owned and operated by the Didier-March Company, at Perth Amboy, New Jersey. The plant will be converted to the manufacture of a complete line of carborundum refractories which are now giving such exceptional service in a wide range of high temperature furnace work.

The principal uses for carborundum refractories as developed up to date have been in the construction of boiler furnaces, water gas generators, carbonizing retorts, heat treating and forging furnaces, all types of oil burning furnaces, pottery kilns, tunnel kilns, rotary kilns, electric furnace construction, muffle furnaces, saggers, etc. In addition to the regular line of made-up refractories, the new plant at Perth Amboy will produce a complete line of high grade refractory cements.

Refractories made in any of the three carbofrax grades are composed of over 90 per cent. of this pure carborundum, to which small percentages of exceedingly high refractory materials are added to facilitate binding. The high refractibility of carborundum is, therefore, maintained in these refractories, and as carborundum cannot be melted, and is destroyed only by decomposition at temperatures over 4000 degs. F., it is also impossible to actually melt Carbofrax brick or special shapes. Their exceedingly low co-efficient of expansion and high thermal conductivity reduces the spalling of these refractories to a minimum, and rapid change of temperature has little effect upon them. Their resistance to abrasion is also exceedingly great, as they are composed of a substance which is one of the hardest materials known. The Refrax brick has the same general characteristics as the Carbofrax, but in the production of this brick absolutely no binding material is used. Refrax brick therefore contains 100 per cent. carborundum.

The plant is located on a site of twenty-four acres fronting on the Raritan River. It consists of a modern clay working and refractory plant with a capacity of over one hundred tons per day and covers a floor space of about three hundred thousand square feet. The buildings are of substantial brick, steel and concrete construction, and there is also included office buildings, laboratories and ample housing facilities for employees. In addition about sixty acres of high grade fire clay lands at Bonhampton have been secured.

Carborundum refractories are made in four regular grades, in addition to which special mixes are utilized in the production of carborundum saggers, known as Carbofrax "A," "B" and "C," and Refrax. All of the standard shapes in which fire clay or silica brick are made can be produced in any of the grades, in addition to which practically any special shape, including tile, muffles and waggers, can be made in any of the three Carbofrax grades only.

Complete information regarding all carborundum refractories and helpful data on their proper uses will be gladly given by the Carborundum Refractory Service Department, the Carborundum Company, Niagara Falls, N.Y.

Belgian Plate Glass Situation

In pre-war days the Belgian glass ovens supplied the greater part of the high grade plate used in the manufacture of mirrors. Naturally when this source of supply was cut off a shortage of glass resulted but it was anticipated that when these ovens resumed production that the situation would show a marked improvement. This improvement has not materialized. In addition to being faced with an unprecedented world wide demand, it was found that it would take a long time and a heavy expenditure to bring the production up to even the pre-war normal.

Commissioner Herring, the American trade commissioner at Brussels, Belgium, recently sent out the following report regarding the shortage of Belgian plate glass: "Advise prospective customers of Belgian plate glass that it is practically useless to attempt to obtain supplies now. Efforts are made to supply pre-war customers, but no surplus is available for new clients. It is impossible to accept orders for future delivery. Labor shortage and lack of coal and raw materials still delay production, now about 60 per cent. normal. No prospects for immediate increase."

The ideal belt is one which never slips, never breaks, and which can be taken up or off in a very few moments.

Outlook for Furniture Sales

M. Wulpi, commissioner of the central bureau of furniture and casket manufacturers, Chicago, issued a bulletin late in March, analyzing the outlook for sales. He believes that the crest of present business in these lines has been reached and he suggests that manufacturers strengthen their sales organizations, watch credits, and guard against overbuying. He looks for a substantial volume of business during 1920, and cautions against the danger of pessimism that might lead to neglect of business opportunities. He adds: "Fundamental factors show that the transition from a seller's to a buyer's market is under way, but there is nothing to indicate that the decline will be precipitous."

In most sections of the country, general sales for the year should remain at fairly high levels for the first six months. The majority of clients may look for liberal orders during the spring and early summer. Deliveries are still behind demand in many lines, a situation stimulating to localities where these industries are a factor. Now that the railroads are back in the hands of their owners, large quantities of equipment and supplies will be required, to the benefit of the equipment centres. Housing facilities are not yet adequate. These and other factors, taken in connection with the usual spring rise, will cushion the inevitable decline. Commitments beyond the summer months should be made with the greatest care, as it is probable that a decline will be more in evidence during the third quarter than it is now.

Money will doubtless be tighter at that time, and the expansion of any but the most essential industries will likely be frowned upon.

Twelve Business Maxims

These twelve maxims have been used and tested by a successful manufacturer and given as tending to insure success.

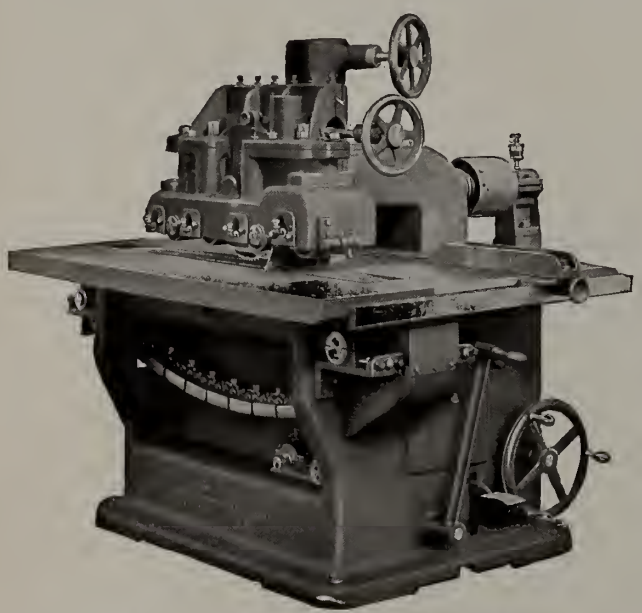
1. Have a definite aim.
2. Go straight for it.
3. Master all details.
4. Always know more than you are expected to know.
5. Remember that difficulties are only made to be overcome.
6. Treat failures as stepping-stones to further effort.
7. Never put your hand out further than you can draw it back.
8. At times be bold; always, be prudent.
9. The minority often beats the majority in the end.
10. Make good use of other men's brains.
11. Listen well; answer cautiously; decide promtly.
12. Preserve, by all means in your power, "a sound mind in a sound body."

An attractive adaptation of William and Mary design, from the Columbia line of Grafonolas

Machinery & Equipment

Straight-edging and Jointing Saw

A machine that is finding favor among the users of straight-edging and jointing saws is the Mattison "Ripper." This is a heavy rigidly constructed machine, the base being cast in one piece. The overhead saw and feed works are entirely encased and an efficient type of kick-back protects the operator from flying chips and edgings. The chain bed is independent of the main table and has vertical and lateral adjustments. The upper feed rolls can be moved apart to permit of easy access to saw and the carrying of large saws. Will handle stock as short as 9½ in. and as thick as 4 in. Carries saws from 9 in. to 14 in. Three rates of feed are provided, 40, 80 and 120 feet a minute. Made in two sizes, one having a capacity of 18 in. inside the saw and the other 32 in. All adjustments are easily made from the front of the machine. The overhead saw mounting is adjustable in all directions ensuring perfect alignment with the chain. The work done is so straight and accurate that for core stock, kitchen table tops and work of a similar



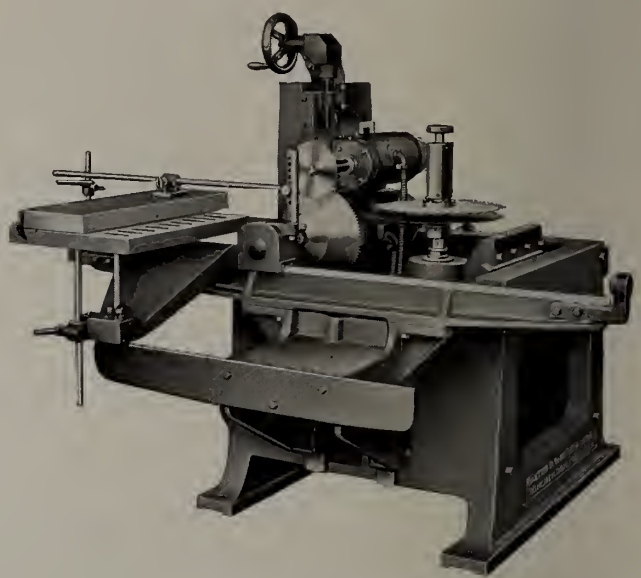
The Mattison, an accurate ripping and jointing saw

nature the material may be glued up from the saw. The Mattison Machine Works, Rockford, Ill., will gladly furnish full information. Chicago office, Republic Bldg., State and Adams Sts., Chicago.

Direct Motor Driven Saw Tenoner

Another application of direct motor drive in the construction of a new woodworking machine is shown below. It is a Direct Motor Driven Saw Tenoner made by Baxter D. Whitney & Son, Inc., Winchendon, Mass. This Tenoner was designed and built to satisfy the demand for a tenoner that could be operated without a countershaft or belts, thus allowing the machine to be set in any position desired and erected without regard to shafting.

An alternating current motor having a speed of 3540 r.p.m. is mounted directly on each saw arbor in place of the pulleys. The housing of each motor is made a part of the yoke that carries the saw arbor and bearings all of which is adjusted as a single unit to secure the desired shape and size of tenon wanted. This application of motors on the saw arbors elimin-



Whitney motor driven saw tenoner

ates all extra bearings as the same bearings serve for both the saw arbor and the motor.

The table can be tilted above or below the center and locked at any angle up to 22 degrees. The top and bottom saw arbors with their bearings and motors are mounted in yokes raised and lowered by elevating screws operated by handwheels. The yoke carrying the top saw arbor has also a horizontal adjustment to line up the top saw with the bottom saw or to cut an offset tenon if desired. Each saw arbor runs in Whitney type self-oiling ball bearings designed especially for high speed. The ends of the saw arbors are detachable and are so made that when screwed down in position against the shoulders of the arbors the ends center themselves and come in alignment with the saw arbors. The bottom saw arbor also carries the 12 in. cut off saw.

The vertical arbor carrying the splitting saws is also mounted in a yoke having a horizontal adjustment to move the saws to and from the work. The entire top of the upright arbor can be removed with the saws. The knee and the yokes carrying the saw arbors are adjusted by the movement of handwheels placed within easy reach at the operator's end of the machine. Any size tenon from 3/16 in. to 3 in. thick and up to 6½ in. long can be cut at one operation. Tenons that are saw cut have a surface that holds the glue better and makes a tighter joint.

The manufacturers, Baxter D. Whitney & Son, Inc., will be pleased to send anyone interested descriptive circular of this machine.

Ball Bearing Trim Saw

A distinct innovation in woodworking machinery in the shape of a high-speed ball bearing trim saw has been placed on the market by the Dominion Machinery Co., of Toronto, Ont. This machine is shown in the accompanying illustration. In addition to the ball bearing feature, the table will tilt to an angle of forty-five degrees and the saw is raised or lowered on an inclined plane. Another new feature is the drive. Instead of the ordinary belt, the drive from countershaft to saw arbor is a V-shaped link belt. This belt, on account of being endless, runs perfectly smooth, and owing to its shape, may be run very slack without slipping.

Dominion variety saw with V link belt

This machine is well guarded, all belts being fully covered by metal guards, and in addition the exposed part of the saw beneath the table is protected. The guards beneath the table are hinged and may be opened easily to give quick access to the saw.

The machine is well finished, and in addition to finding favor in the Canadian market, quite a number have been sold to British woodworkers.

Jenkins Double End Tenoning Machine

This machine is a re-designed model of Hayes standard double end tenoner. Many improvements suggested by users and other improvements worked out by the designers have been embodied in the new machine. It will cut tenons on all lengths of stock between 5 to 9 inches and from 1 to 60 inches wide. The range of tenon sizes is ¼ to 7 inches long and ⅛ to 4 inches thick. The machine is motor driven, having nine motors directly mounted on arbors. These are controlled by push buttons switches conveniently located at the right hand end of the machine. A master switch is provided to stop all motors. It is also made for belt drive. The arbor bearings are all S. K. F. ball bearing type except the feed shaft bearings. The upper and lower cylinders run in ball bearings which are seated in the motor housings. The motor housings are gibbed to yokes and yokes gibbed to the frames, thus providing for adjustments. The maximum between heads is six inches and minimum ⅛. The pressure bar is adjusted by means of a hand wheel and hand wheel lock operated on a ball thrust bearing, 4 inch vertical movements is provided for. Hand lever lock and release permits horizontal movements of pressure bar for instant removal of upper head. Each bar is equipped with 39 pressure blocks, each with it's own individual spring to take up any variation in thickness of stock going through. A 2 h.p. motor drives the feed and the employment of a transmission gives two rates of feed, viz., 12 to 18 ft. per minute. Hand lever feed control is provided on both front and rear. The motors for the cylinder heads saw and cope spindles are mounted directly on each spindle in the place of the ordinary belt pulley. The stator is fitted in a housing that is part of the yoke carrying spindle bearings. This application eliminates all extra bearings as the same bearings serve both spindle and motor.

Full particulars may be secured by writing the Jenkins Machine Co., Sheboygan, Wis., or their representative, the Garlock Walker Machinery Co., Toronto, Ont.

Upholstering and Trimming

"For Men Are Square"

By D. D. Fennell*

(Continued from April "Canadian Woodworker")

Aristocracy and Democracy reached into this industrial problem today almost imperceptibly. Some men when they meet a man like to know what church he belongs to and will say that they do not wish to associate with him unless he shares their religious views. They are narrow and bigoted in these matters. Another man values nothing but money and says, "How much money is he worth? I will associate with him if he is a man with plenty of money." Another man will say, "How does he stand socially?" and so on, but long ago I learned that there is only one way to judge a man and this is so comprehensive. "Is he aristocratic or democratic?" If he is aristocratic I do not care to have anything to do with him. We had an idea that aristocracy was something we inherited; something that came from certain habits and customs and training. Aristocracy is a condition of mind. There are more aristocrats among the laboring men than among the employers. The worker earning $25 may be a typical aristocrat. The aristocrat is a man who is servile to his supervisors, but is absolute in his relation to his fellows. The sort of man that is insolent and unsympathetic and to those over whom he has supervision he is always brutal. The German in his old organization the paternalistic government of Germany—was peculiarly the aristocrat. There is no place in the length and breadth of this American country for the aristocrat. All men are free and equal within certain limits.

There has come into America and there has come into the warp of American society the knowledge that a man must be a man in his own rights, based on those elements that make a democracy, and the fellow that passes a townsman on the street owing to different social strata is a fellow that is going to lose out sooner or later.

There is no place for the "cootie" in America. I was starting out one night to make a speech; my wife asked me what I was going to say. I never prepare anything—I never have time—so I said, "I am not going to say very much; I am going to tell them there is no place in America for a 'cootie.' " She said "That does not sound very nice. Don't tell them that." there is no place in America for a "cootie." Your aristocrat is a parasite. He wishes to give nothing and to receive much; it may be awkward for the fellow born in luxury with nothing to do, but they are parasites, unless they put their time and service into production, for this is a work-day country and this is a work-day time and there is no place for any in this country but democrats.

You must appeal to your workmen today in the most dignified possible manner. You must recognize them as distinct entities in American society. You must look upon them as worthy of the most careful thought by you and the most sympathetic attention from you. In other words, they are just as good as you are. The man today who does not feel for his industrial family a veritable affection wants to get out of industry as soon as God will let him.

*Address before Upholstered Furniture Manufacturers' Association.

Justice

In the city of Buffalo, during the war, we had a demand made by the machinists in 20 different plants at the same time. We picked out five and with the five we organized a "shop committee." The committee was elected by secret ballot and represented the men who had made the demands. The Secretary of War permitted us to appoint one man in industry to represent the employers. It was agreed by the employers of the men that whatever conditions were laid down by the committee they would be the obligations for acceptance on the part of the parties concerned The committee decided upon but one thing, and that thing was justice.

The agreement was made one year ago last July. From that time until the end of the war, there was never an employer or a machinist who broke one jot or title of that agreement. We did not have one strike on the Niagara frontier during the period of the war although there were 6,000 throughout the country—simple justice.

You are having trouble. I hope you win out absolutely, providing you are absolutely fair in this thing. Do not put yourself in jeapordy by doing one single thing that is not right. Prepudice and feeling are so apt to get the best of us that we sometimes do one little thing that is morally wrong, and if we do it our opponents make a balloon out of it.

One of the greatest assets in all the world is common courtesy. I have learned as far back as 15 or 16 years ago every one of my men in my plant (when I had 1,200 to 1,500 of them) was a fellow who was helping me to do a great big job and I could not keep a smile off my face when I met one of them. They used to refer to me as a certain person.

I wanted to do it. It was not a matter of policy. Here was a bunch of fellows who belonged to "my family," and we were all trying to do one great thing. This is not a matter of swap and trade any more. We have to come right out squarely and put all our cards on the table. You can't get more out of anything than you put into it, and a little friendly feeling displayed toward the men will bring back dividends.

Out of justice there always issues brotherhood, and always will. It is right. This great nation of ours was built upon the basis of brotherhood. My friend Jim Foster, of Cleveland, with the Hydraulic Pressed Steel Company, taught his organization one thing—that Foster is first, last and all the time, a square man, and he dares any man to say, "He said one thing and did another." It took days, weeks, months and years to bring his men to understand that there must be no film of distrust between them. Foster's plant is "more than a place to work." Thirty per cent of his men are union; 100 per cent voted against striking when the steel strike was called last

fall. This is the biggest compliment ever paid any man in American industry.

I could name 75 plants where there is no place for unionism at all. They have given their men something so much better, so much bigger, so comprehensive, that the thing is insipid and impossible, and not at all to be feared.

Profit sharing and bonuses are all incidental. I do not care about them one way or another. All the American working man wants is justice and the square deal, and if you are giving it to him in your plant, he will reciprocate, for men are square.

Upholsterers' Association in Annual Meet

The twenty-first general meeting of the National Association of Upholstered Furniture Manufacturers, marks the beginning of the 10th year of its history. This large assembly gathered at West Baden Springs, Indiana, on April 21st and 22nd. There were a large number of delegates present from every section of the country east of the Missouri River. The programme carried out was of the most interesting character and was lead by specialists in the various fields of which the association is now active.

The secretary and official cost accountant, J. L. Maltby, made a resume of the growth of the association during the past year, in which himself and assistant have been engaged exclusively in the interests of the Upholsterers' Organization, throughout the above mentioned territory.

D. D. Fennell, new director of Industrial Relations, gave an address, which was most enthusiastically received on the subject "Handling the Labor Situation," which is becoming active at many points, in the field of the association, while G. D. Pettibone sketched the work being undertaken by the association in production engineering and exhibited some new charts just made from work carried out in connection with the strike situation for the National Association of Upholstered Furniture Manufacturers.

Traffic was presented by Mr. J. D. Pierce, promotion manager of the National Furniture Traffic Association. The new plan on which Mr. Baker, the traffic counsel, is to work was presented. A very large percentage of the delegates present, enrolled for the support of this most important work. Very large savings have occurred to the members during the past year and the difficult situation which may follow will now be covered by Mr. Baker's service.

Mr. C. A. O'Connor made his report on the defense fund of the association, which showed that the industry throughout the country had lent its very valuable support to the handling of the labor situation, particularly in the matter of the Chicago strike. The results are well-known through the literature which has gone to all parts of the country.

A large expansion of the membership was also made at this time. The association finds itself in the soundest position in its history. Action was taken for the furtherance of the work for the ensuing year in the shape of financial support exceeding three times that of any previous year.

A very interesting feature was the attendance of the wives of a large number of the delegates. West Baden Springs is a very delightful place for recreation and was enjoyed to the limit by all those present, some indulging in golf, others in horseback riding and similar outdoor sports, and some "indoor sports," as well as making use of the mineral springs.

Maintaining Maximum Production

A recent issue of the American Manufacturer contained the following interesting statements:

Today capital cost more than 7 per cent. instead of 6 per cent. or less.

Wages are 85 per cent. over five years ago, and heavy in demand and supply scarce.

1911 to 1914 the net immigration was 2,892,000.

1915 to 1918 the net immigration was 437,000.

Up to 1914 only 12 per cent. of all manufacturing wage earners enjoyed a 48-hour or less. Now 48 hours' work for labor is customary.

Labor scarcity and shorter hours have come to stay: 200 men at 54 hours per week produce 10,800 man-hours.

Two hundred and twenty-five men on 48-hour week produce same man-hours.

Manufacturers must secure 12½ per cent. increase production to pay the cost of 48-hour week.

But two aids possible. One, a Wisconsin, illustrated:

Invested $40,000 in new machinery brought $280,000 yearly saving of labor cost.

Another in Cleveland held cost increase down to 7 per cent. despite wage increase of 110 per cent. and material of 50 per cent., through better management and brain production.

Itemizing Fixed Expenses

"There are 18 fixed expenses in business," recently said an expert associated with the Retail Public Ledger, "each one of which has a definite bearing on everybody's business. There are no such things today as 'miscellaneous expenses'—they disappeared with the sock in which the cross-roads dealer used to keep his cash. The 18 standard items of expense follow.

1. Taxes.
2. Insurance.
3. Fuel.
4. Rent.
5. Your own salary.
6. Your clerk hire.
7. Your advertising.
8. Telephone.
9. Office expenses.
10. Office machinery.
11. Equipment.
12. Repairs to equipment and store.
13. Depreciation.
14. Shrinkage.
15. Donations.
16. Bad debts.
17. Interest on investment.
18. Personal insurance.

"Just check these off and see if they don't apply to your own line of business."

Eaton Toy Plant Taken Over

The Eastern Handle and Dowel Co., Ltd., recently took over the plant at Farm Point, P. Q., formerly operated by the Eaton Toy Co. The equipment includes two Hawker automatic dowel machines, two bolters, one 24 inch planer, one C.M.C. sticker, five turning lathes, two Cowan band saws and other small machines. The plant is turning out handles and dowels at the rate of from 15 to 20 thousand a day. It is the intention of the company to install the equipment necessary to increase the output to 50 thousand pieces. While toys are being made the output will be confined to handles and dowels as much as possible.

If your foreman is hasty with you, do not forget he has more to worry him.

THE FINISHING ROOM

Reducing Tendency to Shrink and Swell

High Moisture Resistant Varnish on Well-Seasoned Wood Tends for Greater Dependability in Finished Product

By Dixy Wells

All practical men and even many consumers know the tragedy of using moist wood for the manufacture of furniture. Like many affairs of life, an ounce of prevention is worth a pound of cure.

Experience has taught that less moisture is taken on as wood ages, and each time it is moistened and allowed to dry out there is a diminishing of the tendency to shrink or swell until eventually as years have passed, the wood is very little affected by any of the usual atmospheric changes.

One often hears the statement that certain wood is "hard as bone." This usually means that it has seen years of service, and is thoroughly dried up. As a rule all wood should be thoroughly dry before it is put into cabinet work, and after this detail has received attention a finish should be used that will further help to keep the wood dry.

Suitable Varnishes On Market

There are on the market today standard varnishes, that are water-proof, that even hot water or strong liquids will not injure. Their use tends to prevent the surface absorbing moisture or losing it. There is, of course, a sort of aluminum leaf finish which has been used successfully on the propellers of aeroplanes, but which we believe is impractical for furniture.

The old cabinet makers in Europe had a hard and fast rule that no cabinet lumber should be used that was not thoroughly seasoned by contact with the air, through a period of several years, and in the course of this process most of the tendency to shrink or swell was gradually eliminated. It has been proven that no matter how dry it may be, when subjected to resoaking it is weaker than it was originally.

Experiments indicate that some specimens show a loss in strength of nearly 20 per cent. It has also been found that the loss of strength upon wetting is very great when wood has been dried by steam pressure. In cases of this kind the loss in strength runs away up to over 50 per cent., so you will see that drying processes seem to remove a certain substance in the wood bringing about a chemical change, and it is this change which is supposed to lessen the tendency to swell and shrink from moistening and drying again and again.

Retaining Strength in Stock

Drying always renders it more or less brittle, depending largely upon the degree to which the drying has been carried, and although one will find that the strength of wood increases with its degree of dryness, wood which has been dried and then resoaked is less resilient than when fresh or green, therefore, when the first consideration is strength it is very important that one does not dry the wood beyond the degree to which it is to be used.

A change does take place in the wood as a result of drying, and these changes should be considered when determining the use for which the article is to be put. This change is more or less chemical, but it is probably due to the fact that the moisture in the wood escapes during the process of drying, carrying with it, of course, certain sap substances. This is easily detected from the odor of drying wood, and especially when it is steamed. You can even get some of this in a yard where lumber is being air dried, especially when it is fresh pine, and the evaporation of moisture is rapid.

Each Soaking Effects Change

The more you repeat the wetting and drying process the more substance value is removed from the wood, until in the end there is very little response on its part to changes in atmospheric conditions. More or less of the life of the wood is killed, but still sufficient properties remain to make the wood of great value for special purposes.

There is, we understand, a process in Denmark, prevalent among certain manufacturers whereby a chemical process is employed to produce within a day or two the same changes in wood that under ordinary circumstances would occupy many years.

Time certainly changes the character of all wood either hard or soft, and in the veneer business especially there are many drying and redrying processes to put the wood in proper shape for the furniture manufacturer, reducing in all cases the tendency to shrink or swell in ordinary changes of temperature and moisture.

One big point is to get wood that is thoroughly dry and then put on a finish that will keep it dry. That produces the best furniture, the furniture that will give the best satisfaction to the consumer, who after all is the final answer in sales success. He must be kept enthused; he must find that in return for the price asked he has received a service extending over a period of years that will bring him back to the retailer asking for a certain brand of furniture which you have manufactured.

Cover All Surfaces

There are, of course, a number of good finishing varnishes which will serve all the requirements of protection from moisture, the main point being to get people to use them and to coat all the surface of the wood and not merely the outside face surface.

Take the under surface of chairs, tables, cabinets, etc., moisture is very apt to reach these portions as well as that which is clearly visible, and if furniture is to be kept from swelling or contracting, thus making gaps which destroy the looks and weaken its strength, these portions must be covered.

The cost of wood, especially the better grades, is going higher and higher each day. It is even the

policy of some big mahogany concerns to send men who they expect to mature into positions of responsibility out to the source of supply for some months or even years in order that they may know the mahogany game from start to finish. They know what precious woods cost; they know the trials and tribulations of the business; they know that woods must be conserved. It is so with many other kinds of wood. There are experts who know them from stump to the finished furniture. They know their failings and shortcomings, they know their life and history, and, therefore, are qualified to determine what will best preserve them when made over into the merchandisable product.

After seeing that your lumber is real dry look over carefully the list of available finishing materials to see that only those are used which will give not only longer service in the home, but give the finishing touch of perfection to what you have produced. It is not always necessary to use the same finishes, of course, for the outside surface as for the portions which do not ordinarily show, but in all cases the entire surface should be covered.

Remember that great slogan "Save the Surface and You Save All," and whatever finishes you use be sure they have moisture resisting qualities. You will then obtain a certain amount of protection against swelling and shrinking, which after all is one of the most important items in successful finishing and merchandising.

Securing Good Results with Varnish

Keep Finishing Room Air Fresh and Pure—Plenty of Daylight Assists Drying and Gloss—Proper Temperature Important

When varnish is sealed in cans it remains fluid perfectly. When left to stand in a cup for a few days, the top will be covered with a tough, elastic skin When you coat an object with varnish it will dry apparently to the surface of the object coated. This illustrates that the air dries the varnish not only by evaporation, but also by oxidation.

The air of your finishing room should be kept fresh and pure. Indoor air is not pure; all outdoor air is not necessarily pure, although fresh. Sometimes indoor air is better than outside air—sometimes worse. Varnish will not dry properly if the air is impure. In addition, the gloss is apt to be effected unfavorably. Sulphurous and carbonic acid gases are present in some degree in all city air, and almost always in factory air. These gases have a very bad influence upon the varnish.

Good Ventilation Needed

The finishing room should be shut up while the varnish is being applied to keep out dust and drafts, but as soon as the varnishing is done, it should be ventilated by throwing open the windows, according to weather, to let in the fresh air. The modern factory does not rely entirely on this method, but is equipped with a good ventilating system. Ventilation does not mean drafts. Avoid direct drafts of air upon the work. Fresh air will cause the varnish to dry in the proper time and help give it a gloss, when not rubbed.

Varnish dries better in daylight than at night in darkness. Work done early in the morning will have the rest of the day to dry it in, and will dry much better than work done in the latter part of the day. This shows the importance of having the finishing room well lighted. A dark, poorly-lighted finishing room is not the place in which to work varnish.

A Maximum of Daylight

Daylight and plenty of it. That not only tends to make the finish dry better, but the workman can see better how to do his work properly. Without it the work will likely be disfigured by misses and imperfections. Poor eyesight is also conducive to poor work. For dark days artificial light is an excellent substitute for daylight. Be sure to get the best artificial light. The electric company can advise you. The most expert varnisher will fail to do good work without light. Give your finishers plenty of it.

The air of the finishing room in both winter and summer should be dry and have a temperature of not less than 70 degrees, Fahrenheit. An atmosphere that is too warm will retard the drying of the varnish because heat of a sufficient degree will keep varnish fluid. While heat is employed in varnish drying systems, it is not still heat, but the results are obtained by the introduction of oxygen and circulation of the heated air. If the air is too cool the varnish will fail to work properly under the brush, resulting in many varnish evils. The work upon completion should be stored in a room at least 70 degrees Fahrenheit for a day or two at least.

Warm Humid Air Best

Heat does not necessarily remove the moisture from air. Air may be warm yet humid. Artificial heat will dry out the moisture but as this is not easily obtainable nor desirable in summer when days may be the most humid, prevention is better than any cure. The manufacturer is obliged to take a chance unless it is possible to avoid varnishing in such weather and utilize the workman on something else.—Jamestown Finishing Facts.

Cheaper Denatured Alcohol

A resolution of importance to manufacturing, farming, chemical and other industries of Canada is to come before the Federal House in the form of proposed amendments to the Inland Revenue Act respecting the distillation of denatured alcohol. One of the clauses of the resolution provides.

"That denatured alcohol and specially denatured alcohol which is intended for uses in the arts and industries, or for fuel, light or power, for any mechanical purpose may be manufactured in Canada free from excise duty."

This is the legislation which was urged by the Advisory Council on Scientific Research as a means of bringing "industrial alcohol" within the reach of all users, in the hope that it would prove a cheap and suitable substitute for gasoline, which is becoming scarcer and dearer each season.

Life is a casket not precious in itself, but valuable in proportion to what fortune, industry or virtue has placed within it.

Removing Stains and Blotches in Wood

Simple Treatment to Remove Weather, Water, Alkali, Rust and Other Stains from Different Varieties of Wood—Method of Finishing After Removal of Stain

By H. A. C.

TO bleach stains out of wood a number of points must be observed to make a successful job and to prevent the after effects from the bleaching materials and chemicals. Soft wood or close-grained woods, such as pine, etc., require bleaching at times as well as hard woods, and the treatment of either of those woods is almost similar. The stains usually required to be bleached out of wood are as follows: Weather or water stains, alkali stains, color stains, particularly aniline stains, dog and cat urine stains, iron rust stains, etc. The bleaching out of rust stains and dogs' urine has been the source of a special difficulty and has so far withstood all usually employed methods, but, nevertheless, it is an easy matter.

The hard woods which are easily affected by the weather by alkalies, etc., and which are difficult to bleach, include all woods containing tannic acid in a larger or lesser degree, and include oak, mahogany, cypress, birch, cherry, chestnut, walnut, ash, etc. All sappy or white woods are more easily bleached, such as pine, spruce, hemlock, whitewood, poplar, maple, bass, gum and similar woods.

Finish Must be Removed

As mostly all the wood to be bleached has some kind of a finish, it is of importance to have the finish thoroughly removed before starting the bleaching process. In the case of using a remover containing oil or wax, a final cleaning must be done with soda water or alcohol, to remove all traces of the wax and to allow the bleaching material to affect the wood and to penetrate. As all methods for bleaching wood are based on water soluble chemicals, it is impossible to avoid the sponging up of the wood or the raising of the fibre of the wood.

To bleach small articles, it is advisable to have a wooden tank made of sufficient size to immerse the articles to be bleached, which also would make a more perfect job and save a good deal of the bleaching material, although this is very low priced. The tank for this purpose must be properly joined. No nails or other iron parts should be used on it, and the joints should be bound with white-lead putty or casein. A porcelain-lined metal tank would also answer the purpose, or a rubber-coated tank would be advisable.

Oxalic Acid for Light Stains

For ordinary bleaching of surface weather stains the following solution is sufficient: One pound oxalic acid dissolved in one to one and one-half gallon of hot water. For a more deep-rooted stain an addition of strong white vinegar, or still better, acetic acid, is required, and the bleaching liquid should be applied as hot as possible, repeating the application of same until sure that the bleach has gone as deep into the wood as the stain itself. After bleaching, it is required to thoroughly wash the surface, and an extra sponging off with vinegar is essential.

To bleach aniline stains apply a strong solution of chloride of lime and after a while wash off with clean water, after which apply the oxalic acid method as above given. If the stains do not yield to this treatment, apply a solution of tartaric acid, and treat afterwards as above.

For rust stains the same method is to be used, but in bad cases, instead of using tartaric acid, diluted hydrochloric acid, or a solution of citric acid will do the trick. The chloride of lime method is to be used for dog or cat urine stains. In all cases the oxalic treatment afterwards is required.

Hints For Refinishing

In refinishing the wood, the following is to be strictly observed to make a perfect job, and particularly if the wood has to be filled or stained to avoid a spotted or clouded appearance of the finish. After thoroughly cleaning and drying of the bleached surface, do not sandpaper, but apply a thin coat of shellac which must be pure, greatly reduced with alcohol, about one-half the strength of the regular article used for finishing. Allow twenty-four hours, or as long as possible, for the shellac to dry; after which sandpaper, and only then start the staining, filling, or whatever finish is required. The shellac, be it ever so much reduced, will harden the raised fibres of the wood, and by sand-papering (or using steel wool) they will cut the fibres off short, making a perfectly smooth surface; furthermore, the softer parts of the wood will absorb the shellac to some extent, preventing the stain or colored filler to accumulate in those parts more than on other sections of the surface, and will give a more uniform finish. This is particularly important and apparent where cross-cuts of the wood are intended to show a uniform finish or color with the balance of the job. This treatment with shellac is intended for exterior as well as interior work, and is in no way detrimental for the best exterior work, providing the guaranteed pure shellac is used.

If aniline stains are not intended to be removed, but it is wished to prevent them from striking through subsequent coating, particularly enamel or paint, etc., the following is recommended to set or make such stains permanent. Take one pound of green copperas (ferro-sulphide) and dissolve in one to two gallons of hot water. Add to it one-half the quantity of alum and apply one to two coats of this over the surface.

Refinishing a Filled Surface

Often a person is called upon to remove the filler from the pores of a piece of wood and finish it another color. A good varnish remover will take off all the varnish and if a good stiff brush is used immediately after the filler will usually come out. If the pores are not entirely free from filler give another coat of remover and use the brush again. This treatment, while emptying the pores, will not remove the coloring from the wood. If a lighter finish is desired this color will have to be eliminated with a clear caustic bleach. A number of applications may be necessary. The bleach must be entirely removed with clear warm water, then the surface is ready for refinishing.

Build Good Permanent Foundation

Filling and Staining Important Operations—Material Not Usually to Blame When Trouble Occurs—How One Manufacturer Discovered Faulty Work

By E. D. P.

Laying the firm foundation needed for a perfect finish is one of the main essentials in successful finishing, consequently no operations require more care and watchfulness, on the part of the foreman finisher, than the filling and staining. It is in the filling department that the finish is made and in many instances it is in this department that the finish is marred.

Sometimes troubles unaccountably crop up which are most difficult to solve. The blame for these occurrences is commonly laid at the door of the material being used whereas the real fault lies, in many instances, in the method of its application.

An instance of this kind occurred a short time ago. The writer was recently called in, by the manager of a large factory, to see if he could assist in finding the reason why the filler was not filling the grain of the wood. The same grade and make of filler had been used in this place for a number of years and had always given good satisfaction. It was a filler manufactured by a reputable firm who specialize in stains and fillers.

The trouble seemed to begin all at once. A peculiar feature was, while some of the cases were coming through perfectly filled others did not seem to have any filler in the pores. The foreman was a good conscientious man who knew his work thoroughly and had been giving entire satisfaction.

When the writer called he proceeded directly to the filling department, going alone to see how the work was carried out when the foreman was engaged elsewhere. It did not take long to find the root of the trouble.

During the temporary absence of the foreman the men or boys were wiping the filler off before it had dried flat. As a result the filler was being pulled out of the pores of the wood about as fast as it was being applied. When the foreman was on the floor the work was carried out as it should have been. This accounted for some cases being filled perfectly while others were passed on in poor shape.

It turned out that the men and boys in that department had been shortly before placed on piece work and the trouble dated from that change. Needless to say there was no more trouble from that source as a proper remedy was immediately applied.

There are many reasons why a filler does not work satisfactorily and the above is only one. In nearly every case where trouble is uncountered it does not lie with the filler but is due to some purely local condition or to the method employed in preparing the work and handling the filler.

The fillers that are being distributed today by reliable firms, concerns who specialize in finishing materials, do fill the wood and give satisfaction if handled properly. If you are experiencing trouble with any wood finishing material do not jump to the conclusion that the fault is with the materials used. Make sure that the grade used is suitable for the work on hand and that it is being applied properly. If a solution cannot be readily found call in the service man of the manufacturer of the material. He will gladly help you out. Most manufacturers of finishing material retain service men, who are experts in their line. They are at your service and will help you out with your troubles and assist you in keeping your finishing department at its highest state of efficiency.

Washing Chamois Skins

The chamois is found in practically every finishing department and perhaps a few words on keeping it clean and in good condition would not be amiss. If not kept properly it will loose its softness and pliability.

One of the most satisfactory cleaning solutions is a weak solution of salsoda. Allow the chamois skin to soak in this for an hour or more then remove it and place it in a soapy solution, allowing it to remain immersed for about two hours. It is then rinsed out in clear water, then washed out in water containing salsoda and soap. The water is now squeezed out carefully by pressing with the hands and being in a warm place to dry. Hot water should not be used as it tends to make the skin hard and stiff.

Our Slogan and Pass Word "More Production"

By Will Haas

The high cost of living is the loudest cry today, but if we would all change the cry to the tune of more Production and dance with its melody, we would make old H. C. L. quiver and disappear so rapidly that it would all have seemed to be a dream.

More Production is most important—our Government is asking all businesses to speed up Production, for Production will lead us out of the period of reconstruction in a sane and safe manner and is the only thing that will stabilize prices. Therefore, let American worker take Uncle Sam's advice (ask Dad, he knows) and do his part towards speeding up Production by delivering a square day's work every day, for a square day's pay.

Remember, just as much as you put into your work each day just so much will you get out of it. Every hour's time you lose means just so much less happiness to you and yours, as well as less Production. I have heard someone say: "The best time to loaf is when you are dead."

Let us use our Karpen education and show the lead as usual. Every worker that speeds up production does his part to cut the cost of living. We are in a better position to do so today than ever before; the enlargement of our plant makes this possible.

By merely thinking, hoping, talking and trusting that somehow, somewhere, sometime, things will come out right, while we do nothing to make them come out right is sunstruck folly.

Let's get busy and let's make More Production our slogan and password.—"Karpen Komment."

BIG 4

Write for sample panel showing four great Marietta Specialties, as follows:

MACO

The new principle non-fading Mahogany stain.

Has the non-fading quality of a water stain.

The non-grain-raising quality of an oil stain.

Can be filled directly over the stain like a spirit stain.

KOPALAC

"The last word in spirit Varnishes."

Has heavier gum body than shellac and holds up varnish coatings better. Can be either brushed or sprayed. Will not turn white nor fog when sprayed.

Guaranteed to contain no rosin.

SPARTAN CRACK FILLER

A non-shrinking cement for filling cracks, holes, wind checks and other defects in wood. Saves good lumber that might otherwise be wasted. Made in shades to match the stain. Dries in half an hour.

MARIETTA VARNISH

To cap the climax, the panel we send you will be finished with Marietta Varnish. A high grade article strictly up to the Marietta standard of working and wearing qualities.

FILL OUT AND RETURN COUPON.

An airplane propeller mystery—solved!

AN airplane propeller was being tested for balance at the Hardman, Peck factory in New York. The testing room was closed against air currents that might stir the delicately pivoted blades.

One end of the propeller was heavy. It slowly dropped, one ineh, two, three, four inehes. The workman removed it to his beneh and lightly sandpapered one blade. He eould feel the eutting of the grit through the pliable paper. He quit when he figured he had overcome the slight drop.

But on the testing pivot it again stirred and after a few moments fell an ineh or so. The foreman ehaneed by and said, "You missed it a trifle that time, Tom."

"No, **it ought to stay level,**" said the workman, daring to set his skill against the government testing machine. Just then the propeller returned to dead level. Mystified, they left it and when they came back it behaved the same way. This happened three times.

"I'll bet it's that fly. There he's lit on the blade; see it drop" said Tom. The mere weight of a fly did it."

Doesn't it awaken your highest respect to know the workman ean judge "to the weight of a fly" when smoothing wood, metal or leather? He gets to know abrasives the same as a barber knows razor blades.

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

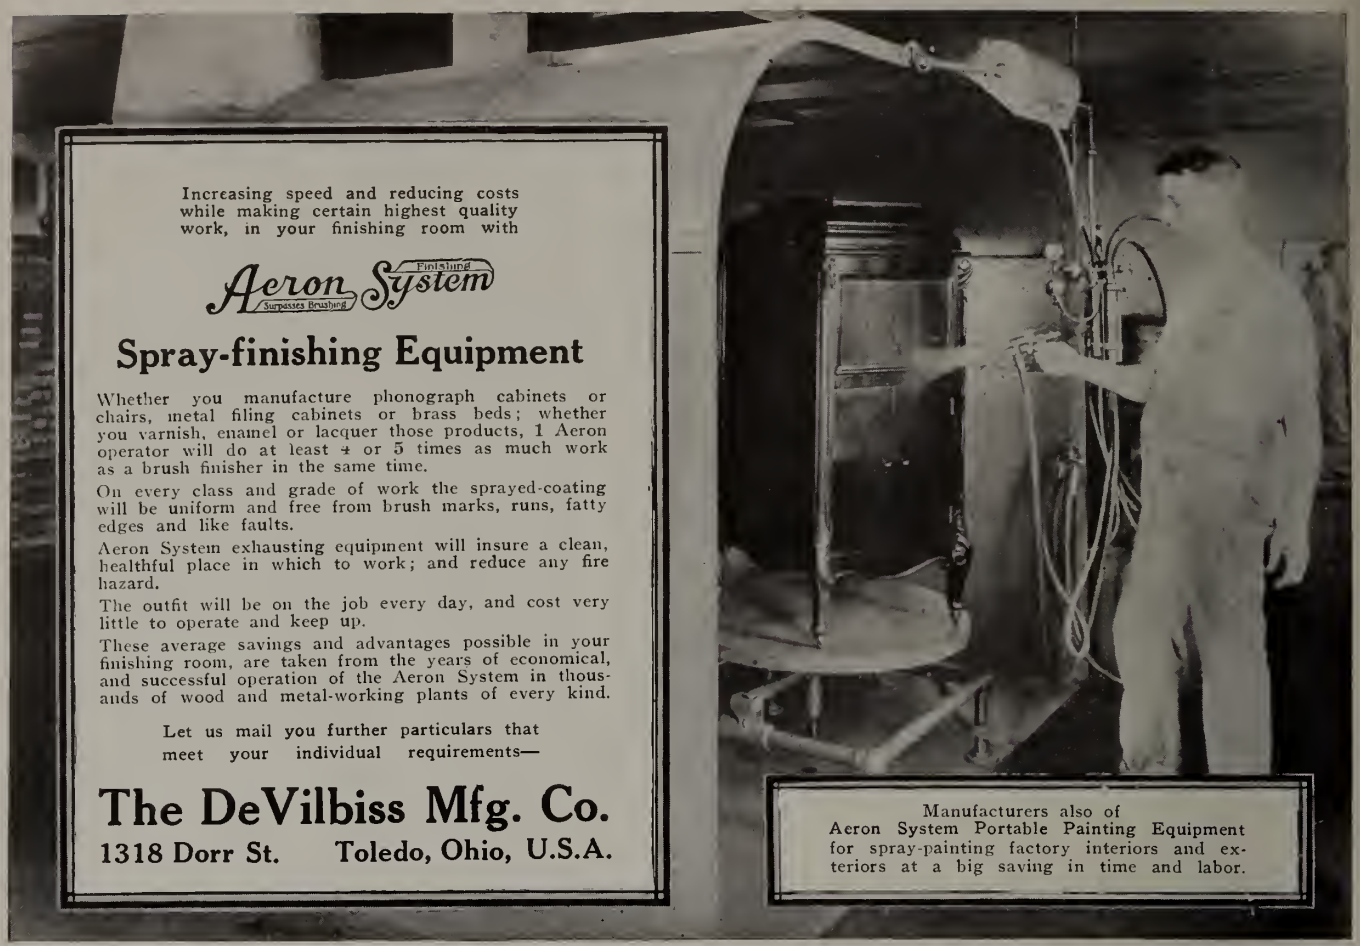
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



Increasing speed and reducing costs while making certain highest quality work, in your finishing room with

Aeron System (Finishing — Surpasses Brushing)

Spray-finishing Equipment

Whether you manufacture phonograph cabinets or chairs, metal filing cabinets or brass beds; whether you varnish, enamel or lacquer those products, 1 Aeron operator will do at least 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be uniform and free from brush marks, runs, fatty edges and like faults.

Aeron System exhausting equipment will insure a clean, healthful place in which to work; and reduce any fire hazard.

The outfit will be on the job every day, and cost very little to operate and keep up.

These average savings and advantages possible in your finishing room, are taken from the years of economical, and successful operation of the Aeron System in thousands of wood and metal-working plants of every kind.

Let us mail you further particulars that meet your individual requirements—

The DeVilbiss Mfg. Co.

1318 Dorr St. Toledo, Ohio, U.S.A.

Manufacturers also of
Aeron System Portable Painting Equipment
for spray-painting factory interiors and exteriors at a big saving in time and labor.

High Grade Stains and Fillers

In our Stains you will find the highest possible color values—they are positive—they are permanent. Manufactured in quantities from the best quality raw materials.

Wood Fillers also that have been tested under the most difficult of varying circumstances and found satisfactory.

Eliminate trouble in your finishing department by using these tested materials.

Veneers and Panels

Can Core Stock Be Too Dry?

Core Foundation of Work—What Might Result From Material That is Too Dry—Selecting and Jointing Stock

By S. H. Johnstone

No doubt many reams have been written on the selecting and preparation of core stock for panels and veneered products, yet faulty work is being continually put on the market. One sees evidences of this in practically every furniture store. While strolling through a showroom recently, the writer noticed a handsome period buffet in beautiful burl walnut. A closer examination of this piece showed that the top was slightly marred by a depression running its full length.

The core is the foundation of all veneered work, and as such should be as near perfect as it is possible to make it. In this particular instance the fault may have been due to carelessness on the part of the veneer men or may have occurred because too much care had been exercised. In any event, it should not have been found if the operators had had a real working knowledge of what constitutes a good core and of the action of different woods when exposed to moisture.

Practical Knowledge Needed

It may seem strange to some to say that the above fault may have occurred because too much care had been taken. Thoroughness, coupled with knowledge, tends for a perfect product, but if knowledge is lacking, extra thoroughness or carefulness may cause considerable trouble. Do not take this as a suggestion that one should not be careful and thorough in all operations, but rather that one cannot acquire too much knowledge, and that knowledge is essential to good work.

Take the case in question. The depression might have been caused by a green or wet piece of stock being glued up in the core body—carelessness. Again, it might have been caused by making the core of different kinds of wood and in an effort to eliminate possible trouble from damp stock drying the core to too low a moisture content—lack of knowledge. As some woods swell more than others when taking on moisture, it is possible that as the core gradually reached a normal moisture content, in equilibrium with the surrounding atmosphere, certain pieces expanded more than others, forming alternate thick and thin pieces, causing the depression mentioned.

Selecting and Sorting Stock

This brings up the selection of stock for cores. It should be a hard and fast rule that only one kind of wood be used in a core, and, better still, that all the stock going into any one core be as nearly the same texture as possible. A soft piece of pine will shrink or swell more readily than a harder piece, and if the two textures were used together, they might produce irregularities on the finished surface.

Chestnut and poplar seem to be favored as the most suitable material for core stock. The high prices being asked for these woods have caused many manufacturers to turn their attention to other sources of supply. One large piano maker has been experimenting with cores made from California red wood. This wood possesses many of the qualities required for this work. When thoroughly dry, it does not warp readily. It is light, takes a fine, smooth finish and may be obtained in large sizes. To date it has worked out very satisfactorily. Another wood that should find favor as a core wood is B. C. or sitka spruce. This lumber was brought into prominence as an aeroplane wood during the war, and since then many uses have been found for it. It is plentiful, light, does not tend to warp and buckle, dries readily and is easily machined. There are many other woods that may be used successfully for solid cores.

Gluing Directly from Saw

The straight edging and jointing type of saw seems to be coming into general use for preparing core material. This machine takes the place of a number of ordinary rip saws and perhaps a jointer or two and effects a saving in time, power, labor and material. With a properly-fitted saw, lumber can be glued up as it leaves the machine without any further correction. When jointing is necessary, the ordinary square joint is about as satisfactory as any. The Linderman takes a certain amount of material without increasing the strength of the joint to any appreciable extent, and, in addition, is an expensive machine to install and operate. The tongued and grooved joint, made on the ordinary automatic type of jointer, is very satisfactory, especially if a V joint is made, for it helps keep the face even when cramping up. It means an extra operation and consumes a certain amount of stock, so that if a straight edging saw is available it is the part of wisdom to use it and glue up from the saw.

Give Plenty of Drying Time

After glueing, the material should stand so as to equalize the moisture of the glue joint and should be at a normal or average moisture content when used. In many cases rough, planer work, if passed, will show up through the face veneers. The planer must be kept in first-class condition and if through poor stock or a poor machine good work is not possible, the cores should be sanded or scraped. This latter specially holds true if cheap lumber is being worked up as a rough spot on the core, such as a knot or cross-grained section, may show through as a depression or may cause a loose spot or blister. This occurs even when crossbanding is applied under the face material.

There is not any excuse for poor results, as attention to detail and a familiarity with veneering requirements will enable any shop to do good work.

View of plant of Birds Eye Veneer Company, Escanaba, Mich.

Veneers From Northern Hardwoods

Plant Situated in Heart of Virgin Hardwood Sections—Every Effort Made For Economical Production—Plant and Grounds Made Beautiful and Attractive

Many of the large veneer manufacturers specialize in veneers in oak, walnut, mahogany or other of the so-called fancy cabinet woods. The Bird's Eye Veneer Co., Escanaba, Mich., devote their attention to the production of a high-grade line of rotary cut veneers in bird's eye maple, plain maple and birch. Other local woods are worked up but the efforts of the company are centred on the manufacture of the lines mentioned.

This concern was organized in 1912 and set about the erection of a modern, well-equipped veneer manufacturing plant. On planning the new building architectural beauty as well as utility was considered and the result was a substantial brick factory constructed along attractive lines and laid off so that the fullest advantage might be taken of modern manufacturing methods and efficient labor-saving equipment.

Surroundings Made Attractive

The spacious grounds which surround the plant and which provide for log storage and the future

Heavy lathe for rotary cut veneers, Birds Eye Veneer Co.'s plant

growth of the business have been made attractive through the inaugunation of a park system and the planting of trees, shrubs and flowers. This work was done under the supervision of landscape artists and the result is a factory setting that attracts the attention and merits the admiration of all who enjoy the beautiful.

In order to obtain a sufficient supply of choice logs—from 2,000,000 to 2,500,000 feet are required annually—the company has contracted with the lumber-

Bright, clean warehouse; note well crated veneers ready for shipment

men in Wisconsin and northern Michigan for any choice trees that may be found in their virgin holdings. In addition experienced woodsmen scour the forests in search of logs that will uphold the reputation and quality of all "Bird's eye" products. The texture and beauty of the veneers cut from these carefully selected logs is such that the demand from the United States, Canada, Great Britain and France taxes the capacity of the plant to the utmost.

Large Floor Space Provided

The main building is 100 x 368 ft., half of which is two stories. Part of this upper floor is used for the emergency drying of veneers while the remainder supplements the warehouse and shipping departments. The main floor embraces the cutting department, dry kilns, crating and shipment departments and the

"The Kiln Drying of Lumber"

A Practical and Theoretical Treatise

By HARRY DONALD TIEMANN, M.E., M.F.

In charge, Section of Timber Physics and Kiln Drying Experiments of the U. S. Forest Service. Special Lecturer in Wood Technology and Forestry, University of Wisconsin. Forest Products Laboratory, Madison, Wisconsin.

Second Edition 318 pages.

The value of a technical knowledge of *kiln drying* is self evident. This book, as does no other upon the market, gives the reader the most recent and most clearly expressed information. The text and illustrations guide the way to the most efficient methods of work.

Price $5.00

Woodworker Publishing Co., Limited

345 Adelaide Street West, Toronto

Not How Cheap, But How Good

THERE are plain reasons why it will pay you to consult us always when in need of birds-eye maple, plain maple or rotary cut birch veneers. Not only do we limit our manufacture to the highest grade of product but we strive toward a constant co-operation with our customers so that the merit of BeVeCo veneers, through our efficient, prompt and courteous handling of customers' orders, will contribute to the fullest extent in helping each customer build up his own reputation for goods of merit.

All our veneers are from prime *veneer logs*, not *woods run* logs, grown in northern Michigan. When you place your order with us you are absolutely certain of getting veneer made from the cream of the best logs known to the veneer business, a certain guarantee of beauty, permanence and uniform refinement in appearance.

BIRDS EYE VENEER COMPANY

ESCANABA, MICHIGAN

BeVeCo VENEERS

Veneers from Northern Hardwoods

(Continued from page 80)

main office. Two additions provide for the six concrete boiling vats and the power plant. A 400 h.p. Corliss engine provides abundant power for the plant and drives the dynamo which generates the current for lighting and the operation of numerous individual electric drives on such machines as clippers, broom handles, lathes, saws, etc.

In the log storage yard, which is at the rear of the plant, the logs are unloaded by means of a powerful portable derrick. When required they are carried from the storage yard, by a rail or derrick, to an inclined skidway which carries them to a specially-constructed conveyor. This conveyor travels past the cut-off saws and in front of the steaming vats then on out through the side of the building. The logs are unloaded from the conveyor in front of the different vats as they travel past, while the short blocks are carried through to the dump at the far side of the building.

Logs Handled Economically

From the steaming vats the logs are picked up by an overhead crane or carrier and carried to the log deck. Here they are barked and made ready for the lathes. The cutting-room is equipped with two Capitol veneer lathes, clippers, trimmers, etc., a small circular mill for working up the cores, broom handle machines—the cores are sawn into crating and broom handle blanks—and other machines. Suitable conveyors are arranged to remove the refuse and clippings as they are made.

The drying is done in 20 compartment kilns 20 x 20, arranged in two rows. The circulation is upward and the stock piled on edge between stickers. In the supplementary drying room on the second floor the veneers are suspended on wires for drying.

After being dried thoroughly the veneers are tagged and stored in orderly piles in the warehouse. When required the stock is taken to the shipping floor where it is trimmed to the sizes ordered, crated and shipped out. The bird's eye veneers are cut one thickness only, viz., 1/28 in. thick, while the plain maple and birch range from 1/8 in to 1/28 in.

Interior Painted White

The interior of the plant is bright and cheerful, being painted white and supplied with an abundance of light, and an effort is made to keep the premises spick and span. All refuse and litter which gathers in addition to that carried off by the conveyors, is removed at regular periods and the stock and other material kept in neat, orderly piles. This tends for greater efficiency and higher production as well as making the men more contented, for it creates a pleasant place to work in.

The personnel of the company is J. C. Kirkpatrick, president; G. W. Earle, vice president; W. P. Schuldes, secretary treasurer and C. J. Bryns, general manager.

Veneers Damaged in Succeeding Operations

Glue Room and Conditon of Stock Not to Blame for All Veneer Troubles—Interesting Facts to be Gained by Following Work to Finish

By J. C. Taylor

We have had lots to say about things that have happened which ought not to happen in the glue room, things that ought to be done that are not done, and there is still room for a lot more good effective talk about the doings in the glue room itself, and the handling of stock before it goes into the glue room. But there is also something worth while to be said about things that happen beyond the glue room, to stock after it has passed through. There is really a two-fold reason for this: There are things done in the glue room the effects of which may show up afterward; then there are things which happen beyond the glue room which may affect the well-being of stock from the glue room in a manner that might be mistaken for things happening in the glue room or before the glue room.

The glue-room man who faithfully follows up stock after it passes beyond may get some pointers for guidance in his own work that will make for improvement. This of itself is worth while, but it is not the most important thing. What is in mind are the things which happen to stock beyond the glue room and the effect they may have on it. These are things worth noting, especially by the management, to the end that remedies may be applied where they are needed.

Drying First Operation

Generally, when stock comes from the glue room its first stopping place thereafter is in piles in the warehouse or drying room, so that the moisture incident to gluing may be dried out before it goes to the finishing room, the assembling room or for wherever it is destined.

Sometimes no attention is given to forcing the drying, and the stock is merely sheltered to dry out naturally in the open air. This is slower, but sometimes it proves more satisfactory in the end than if artificial drying is resorted to, unless the artificial drying is scientifically done and there is included in it a regulation of the moisture content.

One of the things we have been learning recently is that if a panel or similar work is overdried there is set up a condition which makes for warping and checking, and this should be guarded against. The one safeguard against it is to maintain a uniform condition of humidity in the air. Also, that condition of humidity should be, as nearly as practical, the same as the finished work will be subjected to in daily use. Moreover, this applies not merely to the drying out of built-up work immediately after it comes from the glue room, but it applies with equal force to the drying out of the same stock in and beyond the finishing room, and finally it applies to the finished stock while it is stored in a warehouse for shipment.

Excessive Drying Causes Trouble

The old practice of playing safe has been that of getting rid of the moisture, or as much of it as practical, on the theory that there is no danger of getting either a panel or warehouse too dry. The result is that often warping and checking has been developed by the handling of stock beyond the glue room, and we know now this can be prevented by maintaining what we may term a normal humidity condition for finished stock. Fortunately, too, there are made available ways for doing this practically automatically, just as there are means for maintaining a somewhat uniform temperature condition. It is worthy of note in

Let's Talk it Over

INDIANAPOLIS - - - IND.

this respect that uniformity in humidity is a more important matter than uniformity in temperature.

Experiments by the Forest Products Laboratory indicate that panels from the glue room may be dried in a temperature of 120 degs. F., if with this temperature the humidity is maintained at 46 per cent. Under these conditions the panels will come uniformly to a final moisture content of about 8 per cent. within a reasonable drying period. If at the same temperature the humidity is maintained at 57 per cent., the moisture in the panels will not be reduced much below 10 per cent.

The better plan to follow with panels in drying out, after they have passed the glue room, seems to be that of maintaining what is termed a maximum dry humidity condition for the dried stock—that is, not permitting the moisture content to get below that which is normally encountered by the finished product in daily use. The common fault in this connection has been that of overdrying, accompanied at times by too rapid drying immediately after stock comes from the glue room. Then it is trimmed to size and probably taken to the finishing room, where the moisture incident to the application of finishes on overdry wood sets up strains and causes trouble, some of which might be prevented by leaving a little more moisture in the wood when it is taken to the finishing room. Then, in drying the finishes and the finished panels, there may develop some of the same trouble of too rapid drying and too much drying—that is, reducing the moisture content to an abnormally low point—which, it has been proven, causes trouble both with the woodwork and with the finishes.

Normal Moisture Content Desirable

In case panels are made up at a panel plant and must be shipped to a furniture factory or other user, if the panels are abnormally dry as they come from the panelman's warehouse, they are liable to do some warping in transit. Therefore, they should have the normal moisture content when loaded out for shipment, then the user should store them where this normal moisture content will be preserved.

If the panels are dry and he had a dry storage warehouse, close piling of the flat panels will help preserve the natural moisture content. The ideal plan, however, whether the stock is close-piled or is piled with cross-strips, is to maintain in the stock room itself what might be termed a normal condition of humidity. This, we are now realizing, is of more importance than uniform temperature. There is, however, a relation between humidity and temperature which should be studied so that a rational balance may be maintained.

When it comes to finishing-room work, we have there a matter that has always been a bone of contention between the glue-room force and the finishers. Each is inclined to blame the other when things go wrong, while the fact of the matter is that troubles may show up there which are due to faulty glue-room work, but more often the trouble is lack of understanding and following proper methods in the finishing room.

Glue Not Best Size

One of the things that time and experiments have taught us is that glue size as a filler or wood surfacer is poor practice. People have used a thin glue size in various ways, some purely as a filler, others have used it as a means to cleaning fuzz from mahogany faces, and so on. The best authorities now have not only discontinued its use, but they object to glue appearing in any form in the face wood. The argument against it is that it does not properly seal up the pores of the wood when used as a filler, that it is more given to expansion and contraction with changing moisture conditions incident to finishing-room work, and that it makes trouble with some of the finishes, especially those of the varnish class, though not so much when shellac and wax are used. To sum it all up, the place for the glue is inside, not on the outside surfaces.

The matter of stains and fillers in their application to panel faces and the drying out is something that needs more scientific research, to the end that we may have satisfactory stains and fillers without doing violence to either the wood or to the finishing course which comes after. One trouble which seems to arise here is that stains which serve to color the wood best give trouble of one kind and another now and then, while to correct this trouble with stain mixtures of a different class interferes with their penetration and coloring qualities, so there seems to be quite a lot yet to learn.

Through individual effort, and through information furnished by experiments conducted by the Forest Products Laboratory at Madison, we are learning something about finishes and moisture absorption through them that ought to help some.

Have Both Sides Protected

One of the things coming out of this is that uneven coating on wood causes warping. Plainly, therefore, if we have a panel that is varnish-finished on one side and nothing done to the other side, that panel is likely to warp. This is argument in favor of coating panels and woodwork inside as well as outside, and it is argument that should be heeded. Moreover, the inside and the outside coatings should balance up so far as moisture-resisting qualities are concerned, though they need not be the same material. It should be practical to use some cheaper finishing mixture on the inside, as not so much attention is required to the color shading, but it should have body and moisture-resisting qualities that will balance fairly with those of the finish used on the face. Make the face finish whatever is desired and let this be the key to the inner coatings.

This is not so much a matter of quality or bulk or frequent coatings as it is a matter of getting the right chemical composition in a finishing material to balance it up in moisture-resisting qualities.

Among the things the Forest Products Laboratory has discovered about finishes on wood in their relation to moisture is that while thickness of body—that is, repeated coatings—are factors, a more important factor is found in the constituents of the body. In other words, two coats of some varnishes will show moisture-resisting qualities equal to ten or twelve coats of another kind of varnish. Also, after building up what might be termed a reasonable thickness of varnish body, by repeated coats, not much is gained by additional coats.

The moisture-resisting qualities in connection with finish practically all hinge upon the finishing materials rather than upon the kind of wood used. The kind of wood used seems to have practically nothing to do with moisture penetration in cases where varnish coatings are used.

Atmospheric Moisture Penetrating

Another thing that has been found is that the real penetrating moisture is moisture held suspended in

Why N. B. Veneer is Uniform, Smooth, and Handsome

Write for Samples and Prices

NO detail is too small, too insignificant or too commonplace to receive the interested attention of every man represented in the production of N. B. Quality Veneer.

Our factory contains every mechanical device needed in the production of Select Veneer. Electrically driven saws, set in concrete bases, and filed by expert men, mean quality and quantity production. We thus give you minimum cost and maximum quality.

In our immense daylight warehouses all Veneer is carefully inspected and assorted. Here you get correct measurement and satisfactory grades. Securely crating every shipment insures delivery in perfect condition and prevents breakage and waste in your factory.

These facts should be sufficient reason why our products excel and why you should insist on getting N. B. Quality Veneer.

NICKEY BROTHERS INC.

MEMPHIS, TENNESSEE

the air. To state it another way, while the average man would assume that immersing a piece of finished woodwork in water would be a much more severe test than exposing it in moisture-saturated air, such is not the case; in fact, woodwork will take up moisture from the air when the air is saturated with moisture just about as readily as it will take up moisture if immersed.

In the matter of repeated coatings, experiments were conducted with spar varnish, some of the wood being finished with two coats, some four and some more, the results showing some improvements in moisture-resisting qualities up to six coatings, after which there was no improvement. Moreover, the improvement as between two coatings and six was hardly enough to justify its use. This plainly indicates that it is quality, not the quantity of finishing material that determines its moisture-resisting qualities as a surface coating for wood.

The purpose of setting forth things here is to point the fact that there are many things which can happen to a piece of veneered woodwork beyond the glue room, which affect its welfare, and for this reason there is need for attention, for experiments and for the development of proper ways to treat wood beyond the glue room, and even to the warehouse of the finished product, if we would insure quality and reduce the number of complaints.—"Veneers," Indianapolis.

Shortage of Veneer Material in South

Industry Faced with Low Production and Strong Demand—Battery Manufacturers Require Large Amount—Situation will Improve as Logging is Resumed

By Harold E. Everley*

Veneer and plywood, like lumber, are products of the log and any disturbance which reduces the cut and supply of logs will necessarily affect the output of these materials. With the production of logs and flitches for veneer and plywood manufacturing at but approximately 25 per cent. of what it should be in normal times and with the production of veneers and plywood now not more than 40 to 45 per cent. of the normal cut, it is only natural that users of these products find them difficult to obtain.

Because of the present logging conditions throughout the larger portions of the southern territory, which has been described elsewhere, in this issue veneer and plywood production for 1919 and the beginning of 1920 has declined considerably. It may be considered that during September, 1918, the production of veneers and plywoods was more or less normal. During January, February and March, 1919, production of these materials had fallen to 80 per cent. of that in September, 1918. By November, 1919, production was but 60 per cent. of the September, 1918, cut and by December, 1919, it had fallen to 50 per cent. of what it should have been. This rapid decline in the production was due, in the main, to the shortage and increasing difficulty of obtaining of veneer logs and flitches. During the period between January and March, 1920, has been seen a further decrease in the production of veneers and plywood which has declined to 40 or 45 per cent. of the cut during September, 1918.

With the present decreased production has come an increased demand. For five years building operations have been restricted and there has been comparatively little call for veneers for interior finish. With the increase of building there is a growing need for veneer. Another demand for veneer is coming from the battery manufacturers who are increasing the production of their line rapidly. The need for thin stock on the part of the battery manufacturers is beginning to effect the supply of veneers for other purposes. One mill reports that it is expecting to give one-third of its production to the battery people, one-third to the need of the building operations, and the remainder to the furniture industry.

Some idea of the present shortage of veneer and plywood stocks may be had when it can be stated that at present the orders for sawn oak veneers are 100 per cent. more than the stock on hand, and this condition has been true since January, 1920. On February 1, 1920, there were orders for 17,000,000 ft. of sawn oak veneers with but 8,400,000 ft. on hand. These figures represent the production and stock of about 90 per cent. of the total number of firms manufacturing veneer and plywood stock.

The conditions as to the production and stock of sliced veneers is about the same as for sawn material. On February 1, 1920, there were on the book orders for 1,925,000 feet with but 800,000 feet in stock, as compared with 1,800,000 feet of orders and 728,000 feet of stock on hand January 1, 1920. It has been stated that Slicer machinery manufacturers are now twelve months behind in filling their orders for equipment to make Sliced veneers. When this equipment can be manufactured and placed to work it will tend to increase the production of this particular product.

The Rotary veneer mills report being three months behind in filling the orders for Rotary cut veneer.

The present situation in reference to the production and stocks of veneers and plywood naturally has resulted in a greatly disturbed market for these products. Like the lumber buyers veneer and plywood manufacturers have been bidding strongly for logs and flitches to keep their mills in operation and it is not uncommon for an operator to pay $70 to $90 per M. feet for gum veneer logs, and $175 to $250 for flitches, which are now selling for 250 to 300 per cent. more than they did in September, 1918.

The shortage of stocks and difficulty of manufacturing veneers and plywoods, insofar as the producers of the south are concerned, is due, in the main to the scarcity and high price of suitable veneer logs and flitches. The present condition of the veneer and plywood market will gradually improve as soon as the logs and flitches can again be had by the manufacturers in large and increasing quantities which will permit them to gradually build up their stocks of the finished product.

*Report to National Council of Furniture Associations.

In all your dealings, remember that today is your opportunity, tomorrow some other fellow's.

Information and Inquiries

You are cordially invited to make use of this department

Inquiry For Transfers

Goderich, May 3, 1920

Editor "Canadian Woodworker:"

Will you kindly inform us where we can secure transfers suitable for sleighs and similar articles.

Yours truly,

Goderich Mercantile Co.

The Decalcomania Co., of Canada, Limited, 364 Richmond St. W., Toronto, manufacture and stock a very complete line of transfers including stock designs in animals and patriotic designs that should be suitable for your requirements. Neat name plates, in transfers, can be made up to your order. If you require a large number, sufficient to warrant the expense of making stones, etc., you could have transfers made to your own design.

Information on Vegetable Stains

Owen Sound, Ont., April 24, 1920

Editor "Canadian Woodworker:"

Would you kindly give me formulas and instructions for making stains from vegetable bases. Also tell me where the different compounds may be purchased.

Yours truly,

John Burman.

We do not know of any wood stains that are being made from vegetable sources. Experiments along this line were carried on during the war when dyes were exceedingly scarce, which showed that stains could be made from dyes made from certain trees and shrubs. Methods for producing these on a commercial basis were sought. After the cessation of hostilities when dyes became more plentiful, the matter was dropped. Owing to the uniformly satisfactory results obtained with the use of analine dyes, the investigation has not been resumed.

Market for Spool Wood Wanted

Englishtown, N. S., May 6, 1920

Editor "Canadian Woodworker:"

I have unsuccessfully tried to secure information on spool wood from several lumbermen and was wondering if you would kindly assist me. I would like to know the names of firms in Canada, United States and Great Britain who purchase spool wood and the different lengths and sizes required.

Sincerely yours,

W. H. Sellars.

As far as we know there is not any particular sizes or lengths that might be classed as standard. Each manufacturer requires the blanks to be cut to suit his own particular needs. You might write the following spool manufacturers and if they are not in the market for blanks, they might direct you to other firms who are: Canada Spool & Bobbin Co., Limited, Walkerton, Ont; Laurie Spool Co., Limited, Montreal, Que.; C. G. Thompson & Co., Sherbrooke, Que.; Lachute Shuttle Co., Lachute Mills, Que.; Schutz Bros., Incorporated, 152 Chambers St., New York, N. Y.; Leif Sundt & Co., 62 New Broad St., London, Eng.; C. R. Clark, Newcastle, N. B., manufactures a line of spool blanks and might help you in securing a market for your product.

Which Grade of Oak?

A furniture manufacturer has written in asking if F.A.S. plain red oak has a finer grain than No. 1 common. He states that he is using No. 1 common but finds that for such surfaces as table or dresser tops it shows a very coarse grain. He wants to know if using a better grade would overcome this or, if not, would using plain white oak give him a better appearing top. Will any of the readers of the "Canadian Woodworker," who have worked both red and white oak, in the different grades, answer this query? Your co-operation will be appreciated.

In the Market for Broom Handles

A Scotland house would like to get in touch with Canadian manufacturers of broom handles who can fill orders for 1⅛ inch handles 32 to 74 inch long. The name of the inquirer may be had by writing the publishers of the Canadian Woodworker.

Wooden Handles Wanted

A large firm in Holland who make a specialty of importing tools and hardware would like to get in touch with some Canadian manufacturers of wooden handles who are in a position to fill export orders. Any one interested can secure the name of this firm from the publishers of this journal.

Three Ply Boxes Wanted

An inquiry has been received from a concern requiring 10,000 three ply veneer tea or rubber chests 19 by 19 by 24. These are to be shipped K.D., complete with end batons, straps and binding. Any one desirous of going after this business can secure the name of the firm from the publishers of this journal.

A New Resource Map of Canada

A "Map of the Dominion of Canada indicating Natural Resources, Transportation and Trade Routes," scale 100 miles to the inch, has just been published by the Department of the Interior.

On this map varieties of mineral, agricultural and fishery resources, and the timber and fur in general are printed in red lettering in their proper locations. The sites of important water powers, developed and undeveloped are indicated, and the lines of all railroads completed up to date are clearly defined.

The thorough reliability of this map is shown by the caution which ignores probabilities however promising. The trader, investor, manufacturer and economic student will read the map as an open book; its appearance is timely when demand is abnormal and enlarged production a necessity.

The map can be obtained free of cost on application to the Superintendent, Natural Resources Intelligence Branch, Department of the Interior, Ottawa.

An arrangement for tallying the number of feet that has gone through the planer is a necessity in a busy mill.

A chain mortice machine does good work when the chain is kept properly sharpened.

SERVICE

means giving the very best that is in you. No word has been over-played in modern advertising copy more than the word "service." In practical use the word "service" has a relative significance. The advertiser who honestly desires to live up to his advertised service, naturally has as his goal 100% satisfaction in all particulars of his dealings with his customers.

In reality, though, that man who advertises service and then gives the very best in him in his struggle to make it 100%, is giving service in the true sense even though he fall down 33% from his expectations.

Frankly, that is exactly our position to-day. Faced with a tremendous demand for our products and a woefully short supply, on top of which were heaped unheard of weather and labor difficulties, we have not hesitated to invest thousands and thousands of dollars in new mills and new logging equipment, and have spared no effort to get loaded cars out. However, the best we could do was not adequate under the conditions. We are still behind although hopeful of again getting our heads above the mud and mire that all winter has deluged southern timberlands.

At least we can say we have given the best in us and will continue to do so until our service does finally go back to approximately 100% level.

Furniture Men to Exhibit

A number of Canadian manufacturers will exhibit at the Canadian Industries Exhibition which is to be held in the Agricultural Hall, London, Eng., from June 3rd to 17th. This exhibition, the object of which is to stimulate interest in the export trade and to show European buyers that the Canadian manufacturers can supply a large percentage of their requirements, will be the first of its kind ever held outside the Dominion that was not under government auspices. Among the furniture firms which will be represented are: McLagan Furniture Co., Limited, Stratford, Ont.; the Kindel Bed Co., Limited, Stratford, Ont.; Stratford Mfg. Co., Limited, Stratford, Ont.; Simmons Limited, Montreal, Que.; and the Windsor Phonograph & Record Co., Limited, Windsor, N. S.

Amendments to Compensation Act

The amendments to the Workmen's Compensation Act which are before this session of the House, will probably, if enacted, increase the rates by about 25 per cent. The changes include that the the rate paid to injured workmen be increased to 75 per cent. of the average wage, with a minimum of $12.50 a week. Pensions for widows increased to $40 a month and an additional $10 for each child. This clause to be made retroactive to include all widows receiving pensions under the act. Funeral expense allowance increased from $75 to $125. The widow to receive a lump sum of $100 at the time of her husband's death. Injured workmen to receive artificial limbs or eyes free of charge.

It will be seen that these will mean a heavy increase in the amounts to be paid and must be met by increased assessments.

Installs New Broom Handle Equipment

Mr. C. W. Smith, of Grand Rapids, Michigan, U. S.A., has installed two complete sets of machinery for the Canada Broom Company, Montreal. One set of machinery is for finishing, polishing, and colouring broom handles, and the other for threading handles and tapping brush blocks and mop handles. The finishing outfit has a capacity of from 5,000-10,000 broom handles per day. This work was carried out under the personal supervision of Mr. Smith who, in addition to installing the machinery instructed the operators as to the best methods of handling the machinery.

Safety First Rules

Detroit manufacturers conducted a safety first campaign, using the following rules, which were applied to machinists and to men working about the belting and shafting of stationary machinery:

1. Never attempt to stop a machine by grabbing the belt.
2. When replacing a belt stop machinery or reduce speed one-half.
3. If an overhead belt is caught and begins to wind around shaft get away and shut off power.
4. In replacing belts, place them on the driven pulley first.
5. When handling a belt between two overhead pulleys, never place the ladder between the shafts, nor rest it against a revolving shaft.
6. Do not be ashamed to shift belts with a stick instead of the hand, and for overhead work always use a stick reaching nearly to the floor.
7. In shifting belts always use the palm with the thumb and fingers extended and look out for metal lacings.
8. Keep hands off any running belt with metal lacings.
9. Keep hands off any running belts with a loose end of leather lacing.

A Drying Schedule for Air Seasoned Oak

The following skeleton drying schedule is recommended for the kiln drying of air-seasoned oak. It must be remembered, however, that no mere formula in itself will insure the perfect drying of wood. The kiln operator must be trained to watch the condition of the lumber and to apply the proper remedies if things start to go wrong.

The schedule was prepared by the U. S. Forest Products Laboratory for 4/4 plain-sawed oak (highland variety) with a moisture content of 15 per cent. This moisture condition would ordinarily be reached in from 9 to 12 months of air seasoning.

Density of Specimen	Average moisture content in percentage of weight oven dry		
	Relative humidity at 80° F.		
Low	38%	61%	88%
.519	7.6	11.2	19.4
.527	6.0	10.2	17.4
.536	6.5	11.0	18.2
Medium			
.630	7.7	11.3	18.9
.639	5.8	10.7	18.3
.643	6.8	11.3	19.5
High			
.720	6.4	11.2	19.3
.724	7.4	11.4	19.6
.753	6.1	10.8	18.8
Total Ave.	6.7	11.0	18.8

After the stock is dry, the temperature should be held at 145 degrees and the humidity raised to 80 per cent. This condition should be maintained for 10 hours in order to balance the moisture content, thus reducing the tendency of the lumber to warp after machining.

Has Canadian Representative

Mr. Matthew Brown, who for nearly four years past has been Ontario representative of the Gall Lumber Co., Toronto, has been appointed Canadian salesman for the Thomas Hall Lumber Company of Charleston, W. Va. This firm manufactures yellow poplar, oak, maple, chestnut, basswood and other hardwoods, and have for some time been doing business in the Dominion. In assuming his new duties, Mr. Brown carries with him the best wishes of his late employers and the many friends he has made in the trade. He has had a wide experience in the lumber business, first in Hull, Yorkshire, England, where he served five years' apprenticeship with a leading firm, and later in Petrograd and London. Coming to Canada in 1912, Mr. Brown was associated for a couple of years with the R. Laidlaw Lumber Co., Toronto, in the office and on the road. He is conversant with the hardwood trade and is looking forward to developing a large business in the Dominion for his firm.

Hardwoods

My organization has behind it the experience of thirty-seven years in the manufacturing and distribution of Hardwood Products.

When you purchase from me you buy guaranteed quality and satisfaction. And the prices are no higher than you would expect to pay anywhere for the same quality of stock and service rendered.

News of the Trade

The McCoy-Ingalls Phonograph Co. was recently registered at Danville, P. Q.

The Canadian Handle Co., Strathroy, Ont., contemplate installing the electric drive.

The Independent Coal Co., Ottawa, Ont., are erecting a planing mill at their plant on Richmond Road.

I. G. Pickering Co., Dundas St., Toronto, cabinet makers, are planning an addition to their plant.

H. Graham & Son, Midland, Ont., manufacturers of handles, contemplate installing a variety band saw.

The Metropolitan Phonograph Co., Montreal, P. Q., was recently registered with H. S. Paradis as proprietor.

The upholstering business which has been conducted by C. H. Peppler at Kitchener, has been discontinued.

The plant of Merritt & Co., Chatham, Ont., manufacturers of bent goods, was recently damaged by fire.

The H. E. Furniture Co., Limited, Milverton, Ont., contemplate a three-storey brick addition, 58 ft. x 70 ft.

The Chestnut Canoe Co., Fredericton, N. B., are having plans prepared for a four-storey factory 100 ft. x 43 ft.

Simmons Limited, Montreal, P. Q., are erecting a mattress and bedding factory at Halifax, N. S., cost $12,000.

O. Robidoux, L'Annonciation, Que., is planning on erecting a small sash and door factory at a cost $5,000.

The Canada Last Co., Limited, Preston, Ont., are changing their dry kiln to a high humidity, forced draught system.

The Shierholtz Furniture Co., Limited, New Hamburg, Ont., have commenced the construction of a three-storey, 40 ft. x 50 ft., addition to their plant.

There has been a change in the partnership known as the Continental Upholstering Co., Montreal, P. Q., and G. & A. Vineburg are the present proprietors.

The Economical Upholstering Repair Co., and the Havana Upholstering Co., are the names of two upholstering firms who recently opened up in Kitchener.

The Office Specialty Manufacturing Co., Ltd., Newmarket, Ont., have been authorized by supplementary letters patent to increase their capital from $750,000 to $1,500,000.

The Life Long Furniture Co., Ingersoll, Ont., manufacturers of upholstered furniture, are reported to be discontinuing business. J. P. Albrough is the proprietor.

The woodworking plant at Lunenburg, N. S., formerly conducted by Albert Smith, has been purchased by N. Myra, E. Myra and Richard Corken, who will continue to operate it.

The sash and door factory operated by Zenus Clark, Durham, Ont., will probably be taken over by the Clark Metals Limited of Toronto, who contemplate moving to Durham.

The Upholsterers' Union of Winnipeg, have negotiated a new schedule which calls for 95 cents an hour and a 44 hour week, retroactive to April 1. This is an increase of 11½ cents per hour.

A phonograph has been invented by a British engineer which may be heard for two miles. A patent sound box and the employment of compressed air are responsible for this feat.

The plant of the Cranbrook Sash & Door Co., Limited, at Kitchener, B. C., was recently destroyed by fire. A large planer, which had just been installed, had only been in operation one day.

The carriage factory of A. B. Greer & Sons, London, Ont., was recently damaged by fire. The loss will run into many thousands of dollars. It is believed that the fire was started by lightning.

C. B. Williams Co., Toronto, Ont., have had plans prepared for a planing mill to replace the one which was recently destroyed by fire. The new building will be two storeys and of brick construction.

A short strike occurred at the Munro-McIntosh carriage plant at Alexandria, Ont. The men returned when Hugh Munro, vice-president of the Canada Carriages, Limited, promised them an increase of 15 per cent. with a further increase of 10 per cent. on August 1st. He intimated that if present conditions continued it would be necessary to increase the number of hands.

The lath mill recently equipped by Rhodes & Mavor at Thessalon, Ont., has been put in operation. The firm installed new machinery in the woollen mill building to manufacture lath and other wood products.

The Eastern Handle and Dowel Co. Ltd., Farm Point, P. Q., are increasing the capacity of their plant and contemplate installing a Hawker adjustable head dowel machine, a larger sander, blower and a rumbler.

Morin & Freres, Limited, Cap de la Madeleine, P. Q., contemplate erecting a planing mill. The new building will be 60 x 42, two storeys, of corrugated iron construction. They are in the market for the necessary equipment.

The Potvin Box Factory, Blind River, Ont., have closed down for a few days to make alterations to the plant. They are preparing to handle the timber direct from the river to the mill and are building carriers for that purpose.

Simmons, Limited, Montreal, P. Q., are having plans prepared for a large factory to be erected in London, Ont. It is anticipated that a warehouse and showrooms will be build this summer and the factory erected at a later date.

Lounsbury-of-Campbellton, Limited, Campbellton, N. B., have been incorporated to carry on a business as general woodworkers. Capital $90,000. Two of the incorporators are M. E. Betts and E. A. LeGallais, both of Campbellton, N. B.

In all probability the C. Beck Mfg. Co., Limited, Penetang, Ont., will discontinue the manufacture of pails and buckets. Their stave factory was badly gutted by fire a short while ago and it is unlikely that this plant will be built.

George Coultis & Son, Thedford, Ont., are rebuilding their heading mill and will instal, in addition to the old equipment, a few new machines. The building will be 80 x 80 of cement block construction. About twenty men will be employed.

The Harris Wood Products Co., Limited, Toronto, have moved their offices from Bay St. to 109 Church St. They are exhibiting at the new offices a small building built according to the specifications of the Harris system of sectional construction.

Frederick Wragge of Preston, Ont., recently purchased the furniture manufacturing business of W. E. Hill, Galt, Ont. Mr. Wragge has had a wide experience in the making of furniture and contemplates increasing the output of the new plant.

Logans, Limited, Montreal, P. Q., have been granted a provincial charter to manufacture and deal in furniture, fixtures and other wood products. Capital $40,000. J. Kerry and A. S. Bruneau, both of Montreal, are two of the incorporators.

The Otto Higel Co., Limited, Toronto, recently purchased some property adjoining their present factory site. While no changes are contemplated at present, this property will be used eventually to take care of the growth of their business.

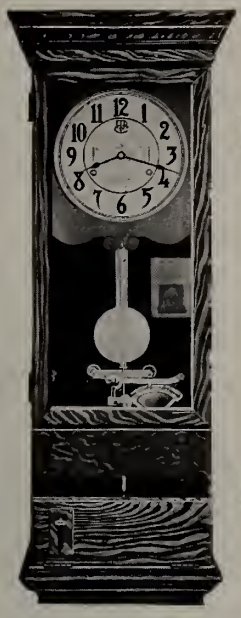
Hart & McDonagh, wholesale lumber dealers, Toronto, have removed their offices from the Temple Building to the Robinette Chambers. The new address is Hart & McDonagh, Robinette Chambers, corner Bay and Temperance Sts., Toronto.

W. McPhillips, Limited, London, Ont., have been incorporated to manufacture and deal in musical instruments, cabinets and other articles of wood. Capital $150,000. Among the incorporators are W. McPhillips and W. H. McPhillips, both of London. .

The employees of Burroughes & Watts, Toronto, billiard table manufacturers, were recently entertained at a banquet. Mr. C. Acland presided. A most enjoyable time was spent, a number of entertainers contributing to the evening's pleasure.

The Wood Pipe Co., Limited, Montreal, P. Q., were recently incorporated to manufacture and deal in wood pipes and other wood products. Capital $50,000. J. W. Carson, financier, and M. L. Hersey, both of Montreal, P. Q., are among the incorporators.

McCabe Bros., Tottenham, Ont., suffered a serious loss when their large planing mill was destroyed by fire. The dry kiln, with its stock of lumber, was also burned. The strenuous work on the part of the fire brigade and citizens of the town, saved the sawmill and lumber yard. About



In these times of high labor costs the plant manager, who doesn't employ the most accurate methods of time-keeping, is courting disaster.

If you think you don't need an INTERNATIONAL JOB TIME RECORDER you can have only two reasons

Either your plant is already fully equipped with them or we have not yet had an opportunity to explain and demonstrate their benefits, or you have **not been in touch with any of our users.** In the first case we have only to wait until your factory has expanded, when we know from your past experiences that you will order additional International Recorders to take care of your increased labor. In the latter case we know that sooner or later you will instal them. How soon ?

These are facts that cannot be disputed—

—a printed, unchangeable time record on every job;

—an accurate, indisputable record that the workman prints himself;
the exact time the job was started and also when it was finished;

—a reliable record that is necessary in establishing the exact labor-costs of any job;

—an investment that will pay for itself over and over again and still keep on working for you.

—it further allows you the opportunity of a trial balance of your productive labor against your total purchased labor—it's the "between" where the leak is.

thirty-two machines were destroyed, the damage amounting to between $30,000 and $35,000. No insurance was carried.

The Falls Combination Desk Co., Limited, London, Ont., have been incorporated to manufacture and deal in desks, office equipment and fixtures. Capital $40,000. Two of the incorporators are A. F. Falls of Chatham, Ont., and F. W. Farncomb of London, Ont.

J. H. Blackie and F. Crowbie, both of Chicago, recently acquired a site in Woodstock, Ont., and will construct a cement building in which to manufacture excelsior. The cost will be in the neighborhood of $4,000. Construction will be commenced in the near future.

The Starr Company of Canada, Limited, London, Ont., was recently incorporated to manufacture and deal in phonographs, pianos, organs and other musical instruments. Capital, $530,000. M. McNaughton and N. S. Brown, of London, Ont., are two of the incorporators.

The Winnipeg Showcase & Fixture Co., Limited, Winnipeg, Man., were recently incorporated to manufacture and deal in store fixtures, furniture and all kinds of wooden articles. Capital $100,000. C. J. McLeod and H. Ormand, both of Winnipeg, are two of the incorporators.

The tax-payers of Aurora, Ont., voted, by a substantial majority, to grant exemption from general taxation for a fixed period to the Anchor Construction Co. This firm intends erecting a plant to manufacture safety matches on the site formerly occupied by the Office Bureau Co.

Good Homes, Limited, Montreal, P. Q., have been incorporated to carry on business as builders and contractors and to manufacture and deal in building material of all kinds. Capital $49,000. C. M. Cotton and F. T. Enright, both of Westmount, P. Q., are among the incorporators.

A. L. Gareau, Incorporee, Quebec, P. Q., have been incorporated to manufacture and deal in vehicles of all kinds, agricultural implements and furniture and to take over as a going concern the business now being carried on under the name of A. L. Gareau, Enrg. Capital $20,000.

The Little Giant Manufacturing Co., Limited, North Bay, Ont., have been granted a provincial charter authorizing them to deal in and manufacture furniture, toys and all kinds of woodenware. Capital $25,000. Among the incorporators are C. J. Collier and G. L. Bull, barristers, of North Bay, Ont.

The Safe Cabinet Co., of Canada, Limited, Toronto, Ont., were recently granted a provincial charter to manufacture and deal in cabinets, wardrobes and all kinds of office furniture. Capital $100,000. Two of the incorporators are J. Stewart, accountant, and H. J. Stuart, barrister-at-law, both of Toronto.

The basket factory which J. E. Assam equipped in Thessalon, Ont., was recently put in operation and is now running full blast. The orders on hand will keep the plant going for many months. Mr. Assam would consider doubling the capacity were it not for the difficulty experienced in securing skilled labor.

Shipbuilding is still active in Nova Scotia, the following keels being load recently:—B. M. Melanson, Weymouth, N. S., for a steamer, E. R. Gaudet, Weymouth, N. S., three-masted 200-ton schooner; the Comeau Shipping Co., Comeauville, N. S., a 200-ton schooner, and Octave D'Eau, West Pubnice, N. S., a fishing vessel.

The Anthes-Baetz Furniture Co., Limited, Kitchener, Ont., were recently incorporated to manufacture and deal in furniture, boxes and other wood products, and to take over as a going concern the business known as the Anthes Furniture Co., Limited, capital $500,000. J. C. Breithaupt and J. H. Baetz, Kitchener, are among the incorporators.

The Eastern Handle & Dowel Co., Limited, Farm Point, P. Q., have been incorporated to manufacture and deal in broom handles, dowels and wood turnings of all kinds. Capital $20,000. This concern recently took over the plant of the Eaton Toy Co. at Farm Point, and are adding some equipment and reorganizing the factory to suit their needs.

The Parry Sound Wood Turners, Limited, Parry Sound, Ont., were recently granted a provincial charter to conduct a general woodworking establishment as wood turners, manufacturers and dealers in lumber, timber and pulp wood. Capital $40,000. Among the incorporators are H. J. Black and C. C. Johnson, manufacturers, both of Parry Sound, Ont.

The Miller & Gordon Manufacturing Co., of Yarmouth, N. S., are erecting a new factory at Carleton, N. S. This building will be 50 by 120, part two storeys high and the remainder three. Many different hardwood products will be manufactured including clothes pins and dowels. A band mill to saw out the timber will be included in the equipment.

National Showcase Co., Limited, Toronto, Ont., have been incorporated to manufacture and deal in all classes of interior and exterior fittings, showcases and other articles of a similar nature, and to take over as a going concern the business known as the Toronto Wood Specialty Works. Capital $40,000. H. Chinn, J. Chinn and Leo Wakeley, are among the provisional directors.

It is of interest to note that at a recent meeting of the Dominion Board of the Retail Merchants Association of Canada, held in Ottawa, a resolution was adopted unanimously opposing the move for a statutory eight-hour day and maintaining that the present system, under which we are operating, is a perfectly fair and sound one and in keeping with good democratic government.

The American Broom Works, St. Basile, P. Q., have installed a number of Kline automatic laths and Nash sanders. The lines manufactured include spools, short handles, wood casters, paper roll blocks and other small pieces of a similar nature. The plant is electrically equipped, the power used being generated at the Shawinigan falls. The daily capacity of the plant is 50,000 pieces of turned work.

The Restmore Mfg. Co., Limited, Vancouver, B. C., manufacturers of furniture, iron beds and bedding, etc., are opening a branch warehouse at Calgary, Alta., to facilitate the distribution of their line in the prairie provinces. Robert Hunter, secretary of the company, is looking after the preliminary work, and R. J. Hurst, formerly manager of the furniture department of Weiler Bros., Victoria, B. C., will have full charge.

Orville Wersching was killed and Clem Frank badly injured in an accident at the plant of the Crown Furniture Co., Limited, Preston, Ont. It appears that these two men were assisting in making some repairs to the roof and in hoisting a bucket of cement, the derrick in some unaccountable manner became loose and toppled over, carrying the two men with it. Mr. Frank had been in the employ of the company for only three weeks.

The new addition, which is being erected by the Kindel Bed Co., Limited, Stratford, Ont., is about complete. The building is 175 x 80 ft. three storeys high. The first floor will be used as a woodworking machine shop but the equipment has not yet been installed. The second floor will be devoted to upholstering while the third storey will be used as a finishing room. Other changes contemplated include three lumber storage tracks and changes and additions to the dry kilnes.

The extensive additions to the Angus, Montreal, shops of the C. P. R. involve considerable alterations and extensions to the woodworking departments. The addition to the passenger car shops total 71,000 square feet; a shelter 126 feet wide by 144 feet long will be built on the west end of the present planing mill for the purpose of keeping material under cover as a weather protection and will give an area of 18,000 square feet for this purpose. Four new stalls will be added to the present dry kiln, increasing the area by 7,400 square feet. The total cost is a million dollars.

The Parry Sound Forest Products Ltd., Parry Sound, Ont., were recently granted a charter with a capital of $100,000. The members of the company are James Ludgate and Robert Lyons. They have purchased a large building from the Parry Sound Lumber Co. which is right in the heart of the town and adioins the switch connecting the C. P. R. to the C. N. R. They purpose manufacturing window sash, kitchen tables, clothes reels and other allied lines and will also carry building materials. Robert Lyons, who is an experienced factory man, will be the manager of the company.

The Snyder Furniture Co., Limited, Elmira, Ont., was recently incorporated to manufacture and deal in furniture and other wood products and to take over as a going concern the furniture manufacturing business formerly carried on in Elmira, by Heimbecker & Jung. Capital $100,000. The officers are H. M. Snyder, Waterloo, Ont., president; A. H. Snyder, of Waterloo, vice-president; and C. H. Snyder, of Waterloo, secretary-treasurer; and Henry Heimbecker, manager. The output of the factory, which consists of frames for upholstered furniture will, for the time being, be taken by the Snyder Bros. Upholstering Co., Limited, Waterloo, Ont.

Personal

F. Whittemore, manager of the Dominion Match Co., Deseronto, Ont., was in Fort William recently on a business trip.

C. O. Maus of the Hyde Lumber Co., South Bend, Ind., spent a few days in Toronto recently calling on the trade.

J. G. Hay of the North American Bent Chair Co. and Mrs. Hay are spending a very enjoyable holiday in the Southern States.

J. R. Shaw, Woodstock, Ont., managing-director of the Canada Furniture Manufacturers, Limited, was elected chairman of the Ontario division of the C.M.A.

Jacob Turrel has resigned his position as superintendent of the Crown Furniture Co., Limited, Preston, Ont., to take a similar position with another firm. He will be succeeded by Frank Sider, of Guelph, Ont. Mr. Sider comes very highly recommended.

W. H. Farnham, superintendent of the Canadian Woodworking Company's plant, Yarmouth, N. S., has resigned to take a position with the Telfer Woodworking Co., Bridgewater, N. S. Mr. Farnham recently acquired an interest in the latter concern.

Wm. Stirrett of Port Arthur, Ont., left recently for Chicago, to consult with his associates regarding the construction of a woodworking plant in connection with the Port Arthur Wagon Works. This factory was recently acquired by Mr. Stirrett and others for approximately $300,000.

S. J. Cook, sales manager of the McLagan Furniture Co., Limited, Stratford, Ont., left recently on a business trip to Great Britain and France. While there he will represent the McLagan Furniture Co. and the Kindel Bed Co., of Stratford at some of the industrial exhibitions that at present are being held in England and France.

W. H. McIntyre, Ottawa, Ont., has resigned his position as assistant general superintendent of the Ottawa Electric Railway Co., and Ottawa Gas Co., and has taken the position of general manager of the Ottawa Car Mfg. Co., Limited. This concern manufacture street cars, heavy gun carriages, ammunition wagons and articles of a similar nature.

Jack Chown, who represents the McLagan Furniture Co., Stratford, Ont., had a narrow escape recently in a fire which occurred in a hotel at Windsor, Ont. He escaped by sliding down a fire ladder in his night shirt leaving behind his clothes and samples. He was enabled to return to Stratford through the kindness of a railroad conductor loaning him a long coat.

D. Hibner of Kitchener, Ont., who recently disposed of his furniture factory to Malcolm & Hill, Ltd., contemplates taking up his residence in Calgary, Alta. Western buyers and other western business men have urged Mr. Hibner to organize a company to manufacture furniture in Calgary. It is understood that the request is being favorably considered and there is a possibility of Mr. Hibner establishing such a plant in Calgary.

Aaron Witmer, manager of the Kitchener and Waterloo branches of the Canada Furniture Manufacturers, Limited, is resigning his position and has purchased a farm at Grimsby, Ont., where he intends devoting his attention to the growing of fruit. Mr. Witmer has been connected with the furniture industry for over twenty-eight years, most of that time in the same factory. He has been with the Canada Furniture Manufacturers since 1907.

Obituary

Angus Campbell, superintendent of the Woodstock branch of the Canada Furniture Manufacturers, Limited, expired recently at the plant one morning.

A. J. Lockhart of Bowmanville, Ont., recently passed away in Vancouver, B. C. Mr. Lockhart was a member of the firm of A. Lockhart & Sons. The interests of this firm include a barrel factory and heading mill at Orono, Ont.

Chas. Fetter of Hepworth, Ont., was killed recently in the plant of the Hepworth Furniture Co., Limited. He had gone under an elevator to make a few adjustments and for some unexplainable reason the elevator dropped a distance of five feet, and striking him on the head, killed him instantly.

T. H. Semmens recently passed away in Hamilton, Ont., at the age of 78 years. Mr. Semmens was a well known casket manufacturer having been connected with the Semmens & Evel Casket Co., Limited, Hamilton, Ont., for many years. He retired a few years ago from active participation in the affairs of the company.

Jacob Kaufman, a well-known Kitchener manufacturer, recently died in that city. Mr. Kaufman operated a large planing mill and in addition was interested in the Kaufman Rubber Co., The Forwell Foundry Co., both of Kitchener, and a large sawmill at Rosseau Falls, and a chemical plant at Trout Creek. He served as trustee of Zion Church for 35 years. He is survived by his wife, two sons and two daughters.

Archie M'Auslan recently passed away in Galt, Ont. Mr. M'Auslan was born in Paisley, Scotland, 78 years ago and came to this country with his parents at an early age. He entered the employ of Jas. Robertson, Galt, and upon Mr. Robertson's death took over his planing mill and has conducted it ever since. Mr. M'Auslan always took an active interest in the affairs of the community and is mourned by a wide circle of friends.

A. W. Benjamin of Yarker, Ont., recently died in Hamilton. Mr. Benjamin was a well known manufacturer having conducted a wheel and axle plant at Yarker, where he manufactured wheels for the McLaughlin Carriage Co. When that company engaged in the manufacturing of automobiles he put in equipment to manufacture spokes and auto wheels. Later he built and equipped a basked factory. He is survived by his wife, three daughters and one son.

The Late W. T. Castle, of Montreal

It is with much regret that we have to record the death of our good friend, Mr. Wm. T. Castle, of the firm of Messrs. Castle & Son, furniture manufacturers and dealers, Montreal.

The late Mr. Castle was in his sixty-third year, and was a native of Montreal. He began his business career with his father, the late Mr. Thomas Castle, who came to Canada from England and established the firm's present business in Canada's commercial metropolis more than forty years ago.

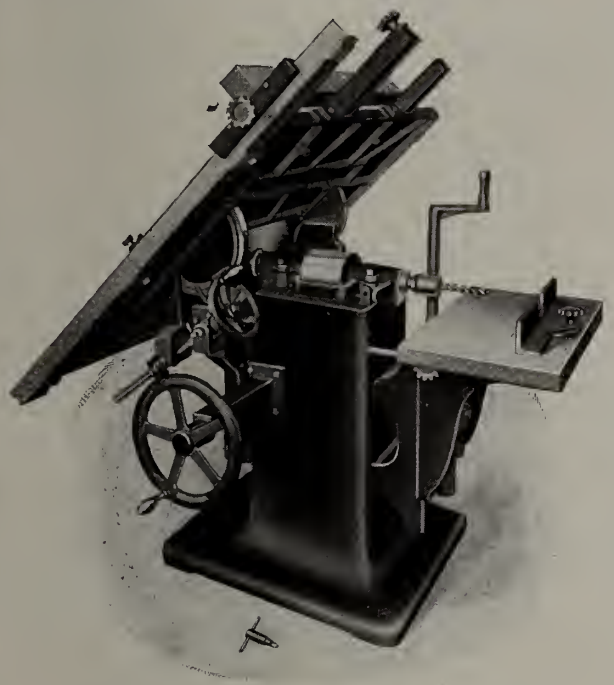
An interesting reminiscence of Mr. Castle may be found in the Annual Furniture Number of this journal, published in November last. To this issue Mr. Castle contributed a particularly interesting and able discussion of "The Manifold Uses and Abuses of Wood." This was the first and last literary effort of the kind ever made by Mr. Castle—and like, the rest of his works, it was good. In his article Mr. Castle advanced a strong plea for the development of a sound national taste in the employment of our native woods. His observations were characteristic of the man—idealistic, diversified, dignified, possessing the strength of true simplicity.

We may be pardoned perhaps for quoting the concluding lines of an editorial criticism of Mr. Castle's article which appeared in the same Number in which his contribution was published: "Those who point us occasionally to the goal of higher attainment are of that exclusive company whose name and fame belong to the Honor Roll of industrial progress."

Toronto Firm Adds Dry Kilns

Robert Bury & Co., Limited, Toronto, have purchased the dry kilns adjoining their lumber yards and veneer warehouse, at the foot of Spadina Ave., from the Toronto Kiln Co. This firm specializes in Canadian and American hardwoods and veneers, including walnut, mahogany and quartered oak. The capacity of the new kilns is 200,000 and their acquisition enables the Robert Bury Co. to carry a large stock of kiln dried woods.

An Excellent Machine for Furniture and Cabinet Work



The "Famous" No. 16 Variety Saw Bench with boring and mortising attachment will do much to increase your output in your furniture and cabinet shops. Accuracy is a main factor in its operation, while the roughest class of work is handled with the same degree of efficiency.

Write us for further information regarding the "Famous" No. 16 Variety Saw Bench and many other machines that you may need and are included in our complete line of woodworking machinery.

Walnut Burls from India

The recent arrival in England of a shipment of 244 walnut burls from India was the subject of considerable comment in the English lumber journals. They are said to be the first Indian walnut burls that have ever reached England. They came from a remote interior province, and the transportation problem was difficult. The valuable blocks of wood were carried twenty miles on the backs of natives, and then ninety miles farther on the backs of camels before rail and water communication with the outer world was reached.

The wood will be sliced in thin veneers in England and will be worked into furniture, interior house finish, and musical instruments. It is intimated that some of this fine wood may seek a market in the United States where highly figured veneers command the best prices.

The exact special if the walnut is not stated in the published accounts. Different kinds of trees pass in India by the name of walnut, some of which are more like locust than walnut; but true walnut grows in parts of northern India, and if it is not the genuine Circassion walnut, it bears close resemblance to it. Apparently this is the wood which has just reached England.

Prices at which these burls are held are not stated; but Circassian wood of a similar kind, when on the market a quarter of a century ago, in London and Paris, commanded a price of $300 a ton.

When a machine is unsteady in its work, jumps, jerks or vibrates, it is a sign of a poor foundation or a poor balance in the machine parts, or both. It goes without saying that every machine should have a firm foundation to rest upon. In most cases the trouble of this kind is not with the foundation so much as with the machine itself. Somewhere, and perhaps more than one or two places, there is lack of proper balance in the working parts. So if you have a machine that is unsteady or vibrates in its operation, have it thoroughly overhauled. When the right balance is obtained the machine will steady down in its work and give better service.

In Tennessee the pencil companies are said to be replacing old fences with new woven-wire fences in order to secure the cedar rails. According to report an investigation of woods not already used for pencils is being made by a lumber company in California, whose representatives have been in Washington and Oregon for the purpose. The juniper, the Alaska yellow cedar, Port Oxford cedar and Idaho cedar are being studied for both suitability and commercial supply.

PROTECTION—

Safety First! How often have we heard or seen this phrase, yet daily, yes, and oftener, accidents are occurring. Silver's Round Safety Cylinder will protect the operators of any of our new jointers from needless injury. They are greatly appreciated by the operators of these machines and they help wonderfully to increase production. Write us for descriptive matter regarding our complete line of machinery that will interest you.

Improved Glue Heater

No heat controllers or other safety guards are necessary with this heater, **because it cannot injure glue.** It's simple, substantially made of copper and costs less than any other.

Let us tell you more about it.

We make any size desired.

Cincinnati Glue Heater Company
Cincinnati, Ohio

CASCO
Waterproof Glue

STRENGTH

Admittedly greater than the **best hide glues,** infinitely stronger than the vegetable glues.

COST

FOR JOINTING. Very much less than the hide glues.

FOR VENEERING. A little more per pound than vegetable glue, but little, if any, more per GLUE LINE FOOT.

PRODUCE THE BEST VENEERED PRODUCT. It costs no more in the beginning and very much less in the end. Hundreds of the larger manufacturers are using CASCO after exhaustive tests in comparison with other adhesives.

MANUFACTURED BY

The Casein Manufacturing Co.
15 PARK ROW - NEW YORK CITY

NOTE. Send for Casco Red Book. It contains much information on glue, veneer and panels.

"The Woodworker's Standard"

Carborundum Brand Garnet Paper and Cloth

The quality of all Carborundum Brand products is recognized by woodworkers to be the standard of durability. For clean, fast cutting, flexible, uniformity every roll, strip or sheet of Carborundum Brand Garnet Paper and Cloth is unsurpassable.

Vegetable Glue

We are manufacturers of **the best line of Vegetable Glues made,** suitable for all purposes from the finest to the roughest work, and solicit correspondence and enquiries from all woodworking industries requiring a powerful Glue for any purpose.

We manufacture a larger line of Vegetable Glue than any other concern in the business and can meet your requirements in every particular, at a minimum cost.

We also furnish upon an easy payment plan, **all the equipment required for the application of Vegetable Glues** and send experts thoroughly posted in this line of industry **to see that you get properly started in the work.**

Our line embraces specially quick drying **Vegetable Glue, Stainless Glue** and **Glue suitable for joint work** of all kinds.

We solicit enquiries from all users of Glue in woodworking, or those contemplating engaging in this line of industry, namely:

1st. Those desiring **the highest type** of Glue for the finest piano, cabinet or furniture work in which minimum cost is secondary to perfect results.

2nd. Those producing high and medium grades of work and are interested in getting **the best product at the lowest cost.**

3rd. Producers of low grade or rough work who require **the cheapest product that will give satisfactory results.**

4th. Producers of low or high grade work who have had, or are having any trouble of any kind with Vegetable Glue through lack of proper adhesion or uniformity, or have any other **problems to solve.**

5th. Consumers of Vegetable Glue who are ready and willing to try out a new product with a view to securing better, as well as **more economical results.**

6th. Those now using another grade of Vegetable Glue and willing to change for an equally good, or better product at a **lower cost.**

Any or all of these six classes of consumers of Glue we believe we can serve to **great mutual advantage.** Give us a chance to prove our claims. Correspondence solicited.

MOULDINGS We are making more Period Mouldings than ever before. Orders should be placed early to assure your supply when needed.

KNOBS The Period Knobs we placed on the market a few months ago are proving very popular. If you have not received samples ask for them now.

ROSETTES A new Period item to accompany the knobs.

Waddell Manufacturing Company

Coldbrook and Taylor, N. W. **Grand Rapids, Mich.**

HOW DO YOU DRIVE WOOD SCREWS?

The Automatic Electric Screw Driver is small. It weighs only 6 pounds and everything larger than this is impracticable for driving wood screws.

With an automatic your men can drive screws all day long and not get tired out and it will do the work so much faster than the hand brace, that you will be putting two-thirds the men now driving screws on to more profitable work where their skill will count.

Ask for Bulletin 1 now and learn how to drive wood screws the MODERN way.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without re-sharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,

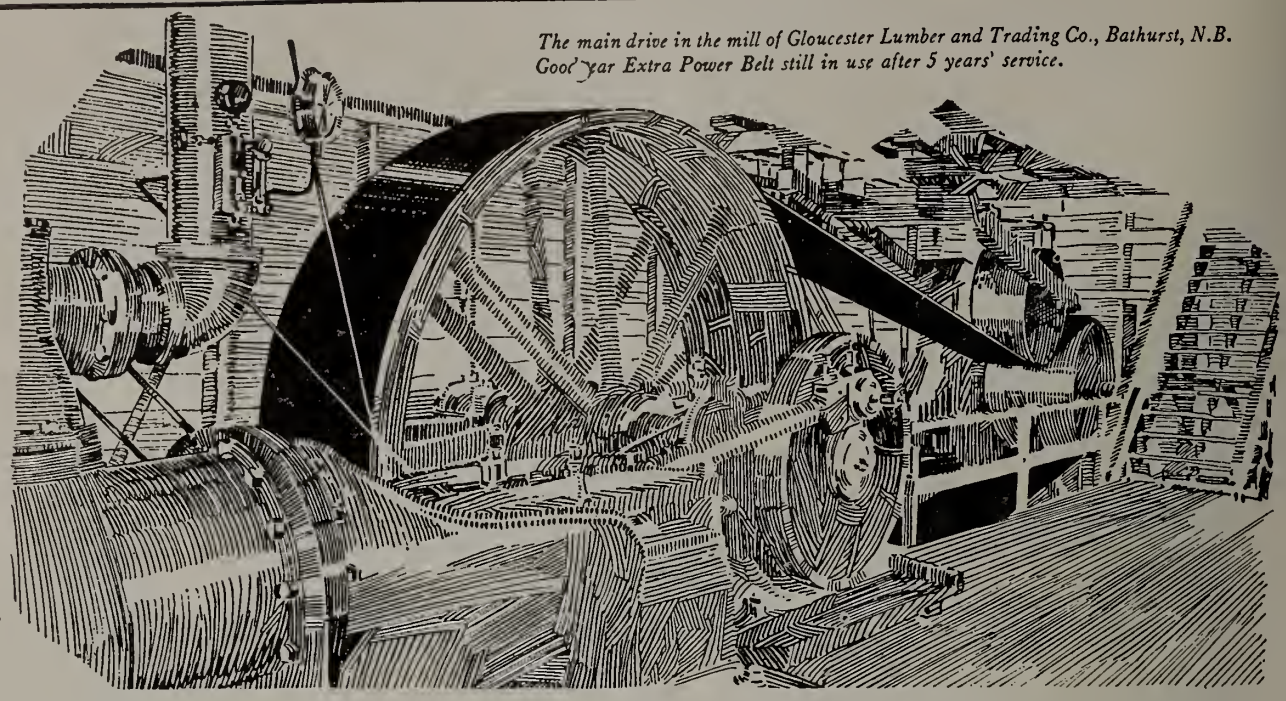
AGENTS FOR L. & I. J. WHITE CO., MACHINE KNIVES



The main drive in the mill of Gloucester Lumber and Trading Co., Bathurst, N.B. Goodyear Extra Power Belt still in use after 5 years' service.

Master Belts of Industry

Goodyear has solved the problem of belting the great main drives of industry—the backbone of production.

Experience, in a thousand Canadian plants, says Goodyear Extra Power Belts.

Because these belts are *strong*—with the strength of properly selected fabric, every thread perfect.

Yet *flexible*, hugging pulleys, taking advantage of every inch of pulley surface. Flexible because in Goodyear Extra Power Belting high-grade rubber is forced through and through the fabric in generous quantities. Every strand is cushioned in it. No stitching to stiffen or weaken the belt. No separation of plies.

Its *friction* surface grips, even through dampness or dust. No slipping with Extra Power. No need for extra tight belts, pulling pulleys out of line. No need for belt dressing. No lost power.

The testimony for Goodyear Extra Power on main drives is very complete. For instance:—

The Norfolk Milling Company, of Simcoe, writing about their main drive belt, purchased a year ago, say:—

"Has been in continuous operation for one year, and has not stretched nor given us the slightest bit of trouble."

There are many others—some selected at random are:—

Swedish Crucible Steel Company, Ltd., Windsor, Ont.
Dominion Sugar Company, Ltd., Chatham, Ont.
Dominion Forge and Stamping Co., Ltd., Walkerville, Ont.
Page Wire Fence Company of Canada, Ltd., Walkerville, Ont
Echo Flour Mills, Ltd., Gladstone, Man.
P. Burns Company, Ltd., Edmonton, Alta.
Hollinger Consolidated Gold Mines Co, Ltd., Timmins, Ont.
Dome Mines Company, Ltd., South Porcupine, Ont.
Burrard Saw Mills, Ltd., Vancouver, B.C.
Silverton Lumber and Power Company, Ltd., Silverton, B.C.
Woodstock Electric Railway Light and Power Company Ltd., Woodstock, N.B.
Gloucester Lumbering and Trading Company, Bathurst, N.B.
Amherst Foundry Company, Ltd., Amherst, N.S.
Hull Iron and Steel Foundries, Ltd., Hull, Que.
Quebec Graphite Co., Ltd., Buckingham, Que.

The complete story of Goodyear Extra Power Belts on main drives is interesting. There are facts about other types of drives just as important to you. Let a Goodyear belting man call and talk to you. No obligation. Just phone, wire or write the nearest branch.

The Goodyear Tire & Rubber Co. of Canada, Limited

Branches:—Halifax, St. John, Quebec, Montreal, Ottawa, Toronto, Hamilton, London, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver. Service stocks in smaller cities.

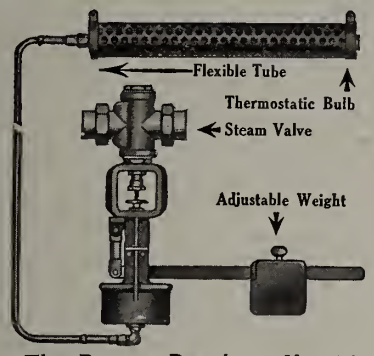
Mechanical Appliances Release High Priced Workmen

You can relieve the labor situation by using machines on automatic jobs and releasing high priced men for work machines can't do.

The Powers Automatic Heat Regulator



The Powers Regulator No. 15

Specially designed to control temperature in dry kilns, ovens, varnish and dry room. Entirely automatic and self-contained.

With this mechanical watchman on the job you know that the temperature in your varnish room or dry kiln is uniform and correct; that your glue pot cannot get too hot or too cold. It brings peace of mind and prevents loss and damage.

We have been studying heat regulation for over thirty years. We can help you with your problems. Write us for Bulletin No. 138, or better still, give us the details of the process where you want heat control and we'll give you the benefit of our experience.

We will be glad to send the Regulator best suited to your requirements and if you are not satisfied that it does what we claim for it, return it to us within thirty days and we'll cancel the charge.

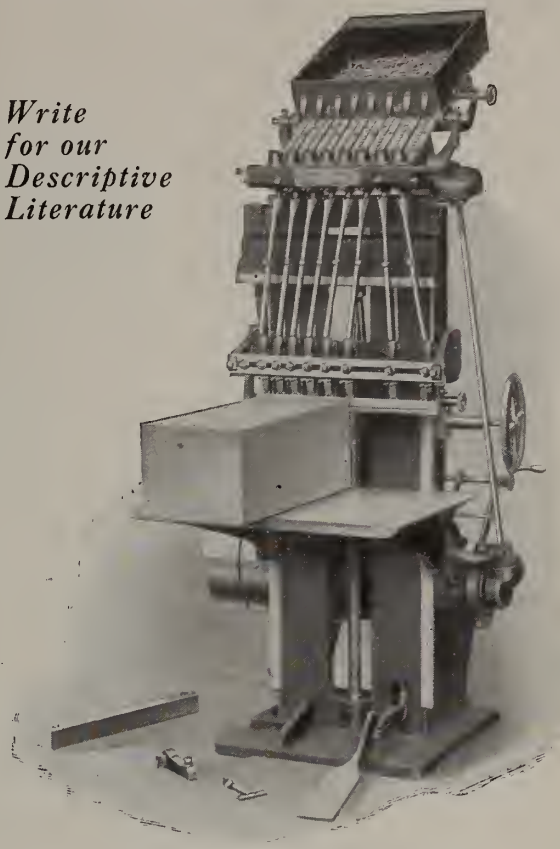
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

OLSON FRAME EXTENSION

Increases Service Reduces Costs

Just a Few Users—

Robert Bury Co. Canada, Limited, Toronto, Ontario.

Batts, Limited, Toronto, Ontario.

Cibbard Furniture Company, Napanee, Ontario.

Langmuir Manufacturing Company, Toronto, Ontario.

Gardiner Lumber Company, Galt, Ontario.

Irvin Lumber Company, Toronto, Ontario.

The Olson Frame Extension will mean increased carrying capacity for each of your Ford Trucks. They insure smooth running, perfect balance and easy operation that will prove ideal for the transportation of lumber, furniture, etc., for short or long distances.

Olson Frame Extensions are sold by all Ford dealers. Our nearest branch will be pleased to furnish you with further particulars.

Swedish Crucible Steel Co. of Canada, Limited, Windsor, Ont.

Branches:—614 Excelsior Life Bldg., TORONTO. 285 Beaver Hall Hill, MONTREAL.

44 Yates No. 275
30 and 60-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

8 New Andrew Mutiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

7 New Hermance Molders, 8, 10 and 12-in., stationary and slip-on heads.

Band rip saw, Fay & Egan, 42-in.
Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Carver, 5-spindle, Moore.
Door clamp, Fay-Egan, heavy.
Edgers, two, three and four saws.
Glue cookers and retainers. Glue spreaders.
Hogs, two, Mitts & Merrill.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Knife grinders, two 32-in., F. & E.
Lathe, Ober spoke and handle, almost new.
Lathes, Mattison, No. 8 auto; No. 6 block mach.
Lathes, speed, eight, mounted on iron bed.
Lock-corner machine, Morgan No. 8, full set.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, end, Sherman, fine condition.
Matcher, 24x6-in., 3 and 4 sides.
Automobile spoke machines, Defiance, complete set.
Band resaw, 50-in., Fay & Egan, tilting rolls, full set of filing room tools.
Molder, Smith 14-in. outside, latest style, practically new.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan No. 184, 12-in. outside.
Molders, inside, 13-in. American and Woods.
Mortiser and router, Fay & Egan No. 124.
Mortiser, chain saw, New Britain No. 1, 25 chains.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type.
Nailers, two, Morgan No. 8, used three months.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread.
Pony planers, 16, 20 and 24-in.
Relisher and mortiser, Greenlee.
Rip saws, self-feed, Hoosier, F. & E., Greenlee.
Router for stair stringers, H. B. Smith, flexible arm with adjustable table and forms.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30 and 42-in. Columbia; 30, 42 and 48-in. Invincible; 30-in. double Invincible.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, B. & M. double-end, also several single-end tenoners with and without copes.
Timber sizer, Fay-Egan s4s, 17x12-in.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

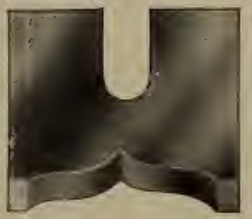
ATKINS
STERLING QUALITY
SAWS and KNIVES

The best steel—the most careful and accurate workmanship—the equipment that will eventually save you money.

Atkins Sterling Quality Saws and Knives are proving their superiority by competitive tests in the largest plants of the country. We welcome your most careful investigation, as we know the satisfaction that will result.

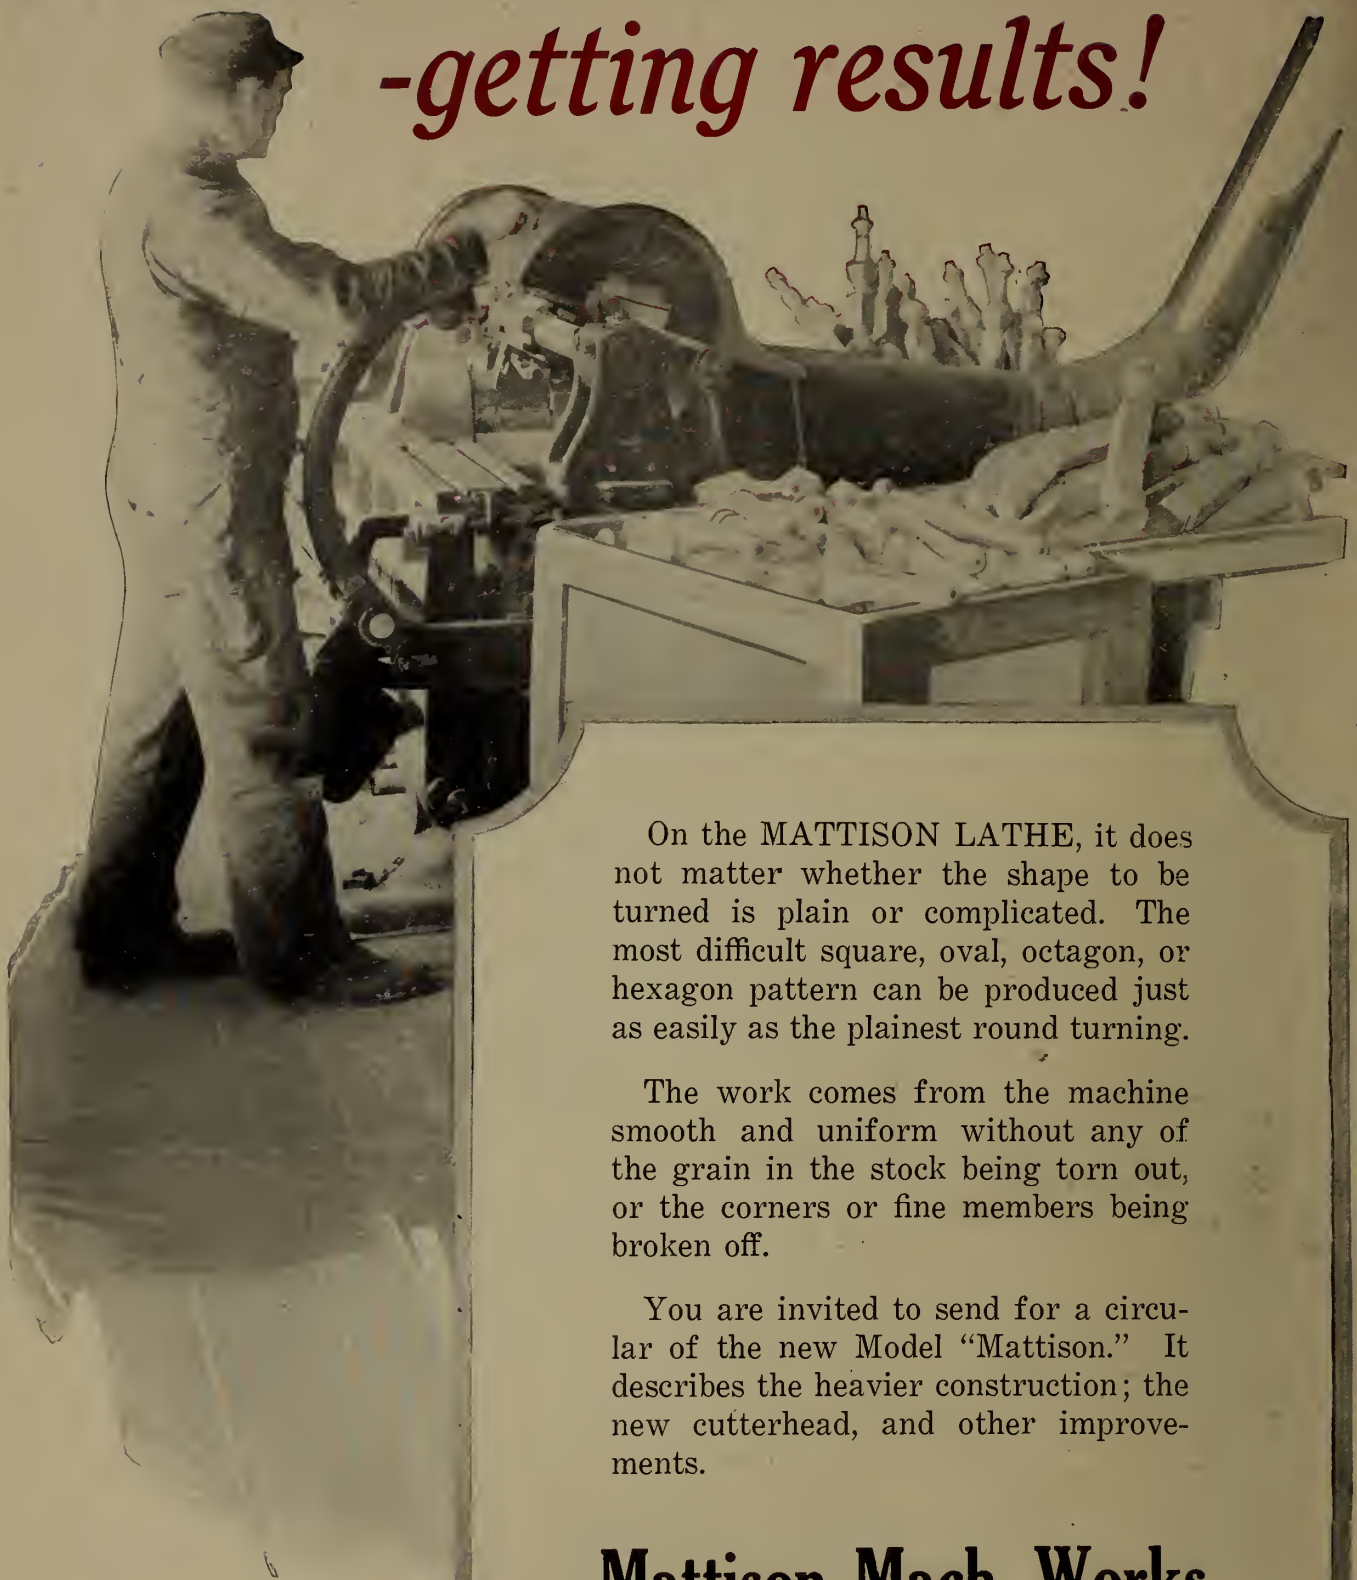


Write to-day for our Knife Booklet "C W" and Pattern Template Paper.

E. C. ATKINS & CO.
Makers of Sterling Saws

Factory—HAMILTON, Ont. **Vancouver Branch—109 Powell Street**

-getting results!



On the MATTISON LATHE, it does not matter whether the shape to be turned is plain or complicated. The most difficult square, oval, octagon, or hexagon pattern can be produced just as easily as the plainest round turning.

The work comes from the machine smooth and uniform without any of the grain in the stock being torn out, or the corners or fine members being broken off.

You are invited to send for a circular of the new Model "Mattison." It describes the heavier construction; the new cutterhead, and other improvements.

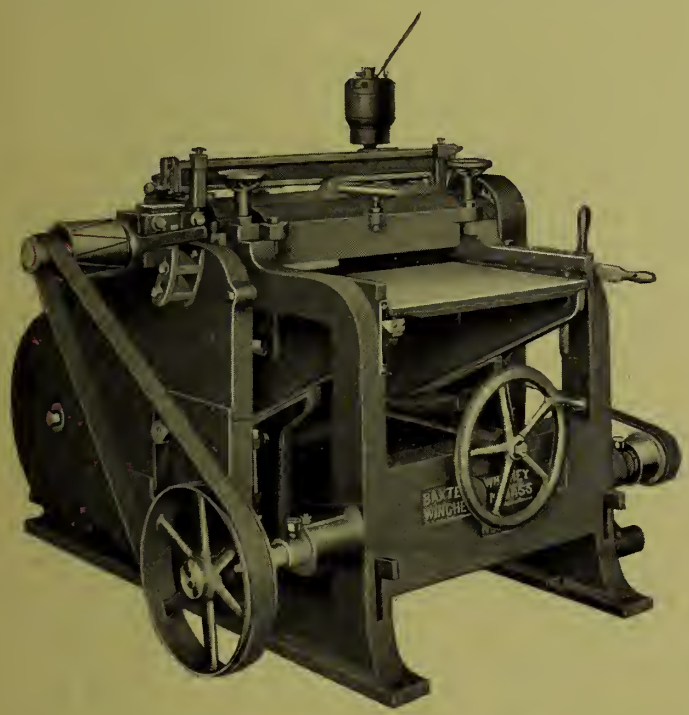
CANADIAN WOODWORKER and Furniture Manufacturer

THE WHITNEY
30" No. 32 Single Planer
with Round Cutter Head and Electric Grinder
has special features that appeal to every woodworker, such as the



30" No. 32 Single Planer—Round Cutter Head and Motor Grinder

RIGID FRAME with ample weight of metal.

BED raised and lowered on Solid Wedges operating on wide tracks.

HARDENED CENTRE TABLE made extra thick.

AUTOMATIC CHIPBREAKER working concentric with the cutter head.

SIDE CLAMP CUTTER HEAD BOXES easily detached.

CUTTER HEAD with long bearings of large diameter.

REMOVABLE BABBITTED FEED SHAFT BOXES.

SECTIONAL FEED ROLLS to handle narrow and uneven stock.

MACHINE CUT GEARS.

Whitney Planers are equipped with motors coupled direct to the cutter heads when desired.

These machines can be furnished with two or four-knife Square Cutter Heads or four-knife Round Cutter Heads, Flexible or Sectional Chipbreaker and Motor-driven Grinders and Devices.

Write us for further information about this machine.

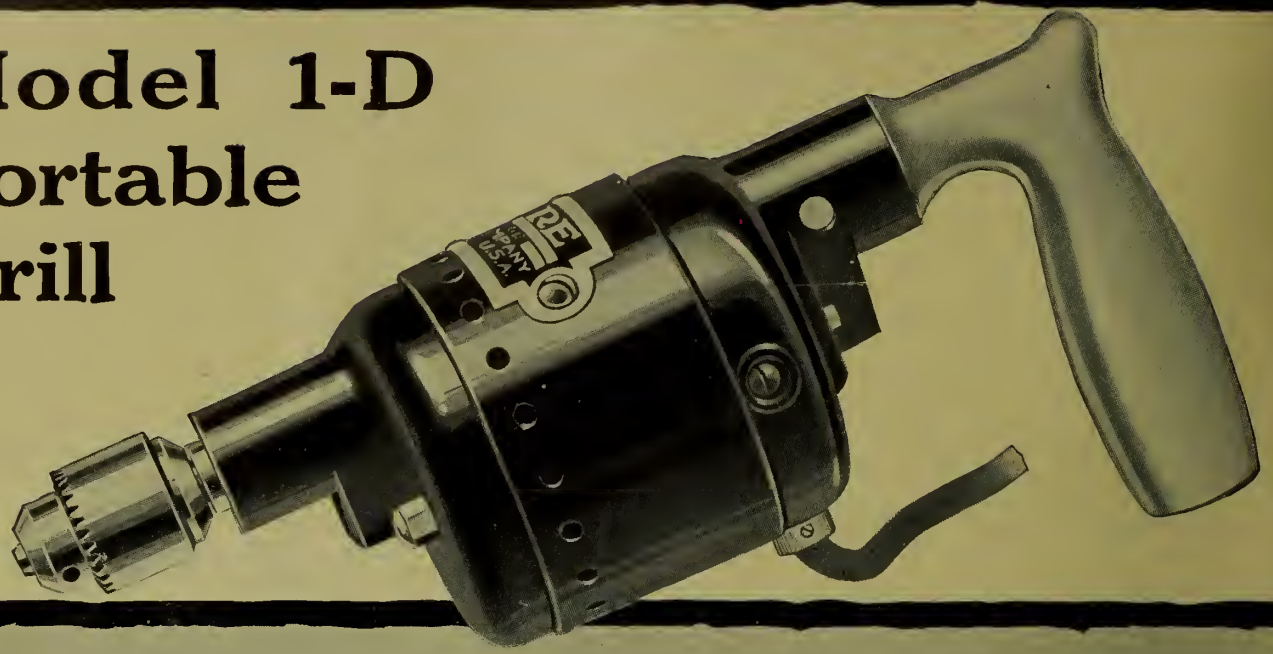
Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to 3/16". Wood and alloys, 0 to 1/4".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center 3/4".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

Wisconsin Electric Company

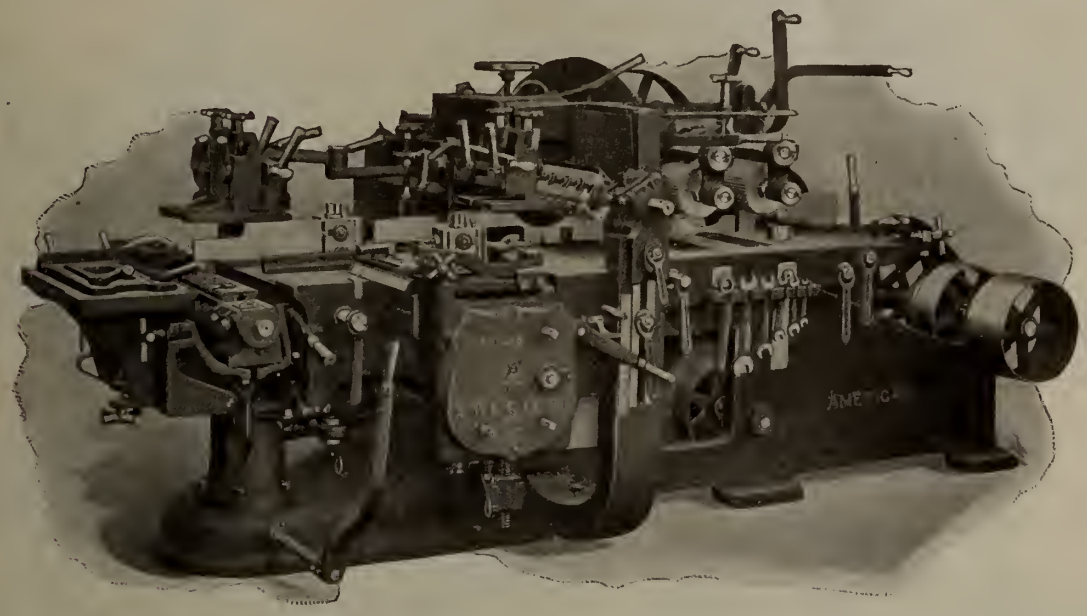
DUMORE GEARED ELECTRIC DRILLS

American No. 26 Four Sided Outside Moulder



A fast-feed machine—slip on and off heads— quick adjustments — heavy type—chip-breaker throws back out of the way when applying or changing cutters—Large size feed rolls with chain drive—and many other improvements which make possible quicker setting up and operation on this outside Moulder.

American No. 25 Edging Saw

Large size arbor and pulley allows high speed with plenty of power. Two chains in table and four sets upper feed rolls. Strong and accurate feed. Owing to arrangement of upper feed rolls very short stock can be fed through this machine. Compact, but with strength in every line and dimension.

Both of these machines for delivery from our Toronto warehouse.

Will do the work of Five Hand Jointers in making Glue Joints

This is the guarantee given with our

No. 4 Continuous Feed GLUE JOINTER

Strongest and most complele machine on the market.
Any part may be readily removed or renewed.
Feeds in opposite direction, giving 100 feet per minute.
Works material from six inches up to any length desired.
Also from one quarter to 3 inches thick, and from three-quarters of an inch wide up to any width.
1 set Shimer Special Jointer Heads supplied with machine.

Investigate the merits of this machine—it will pay you!

Jackson, Cochrane & Company

KITCHENER - CANADA

The "Shimer" Round Safety Cylinder

Why is it different from all others?

It is the only cylinder on the market on which you will find the adjusting nuts properly located for easy and quick adjustment of the knives. This adjustment may be made to within 1/1000 of an inch, a feature that is very desirable for fine work. The Shimer way of holding the knives at the proper cutting angle does away with the old style of tapping into the head.

The Shimer Round Safety Cylinder with High Speed Knives, is made in any diameter and length and for any make of machine.

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

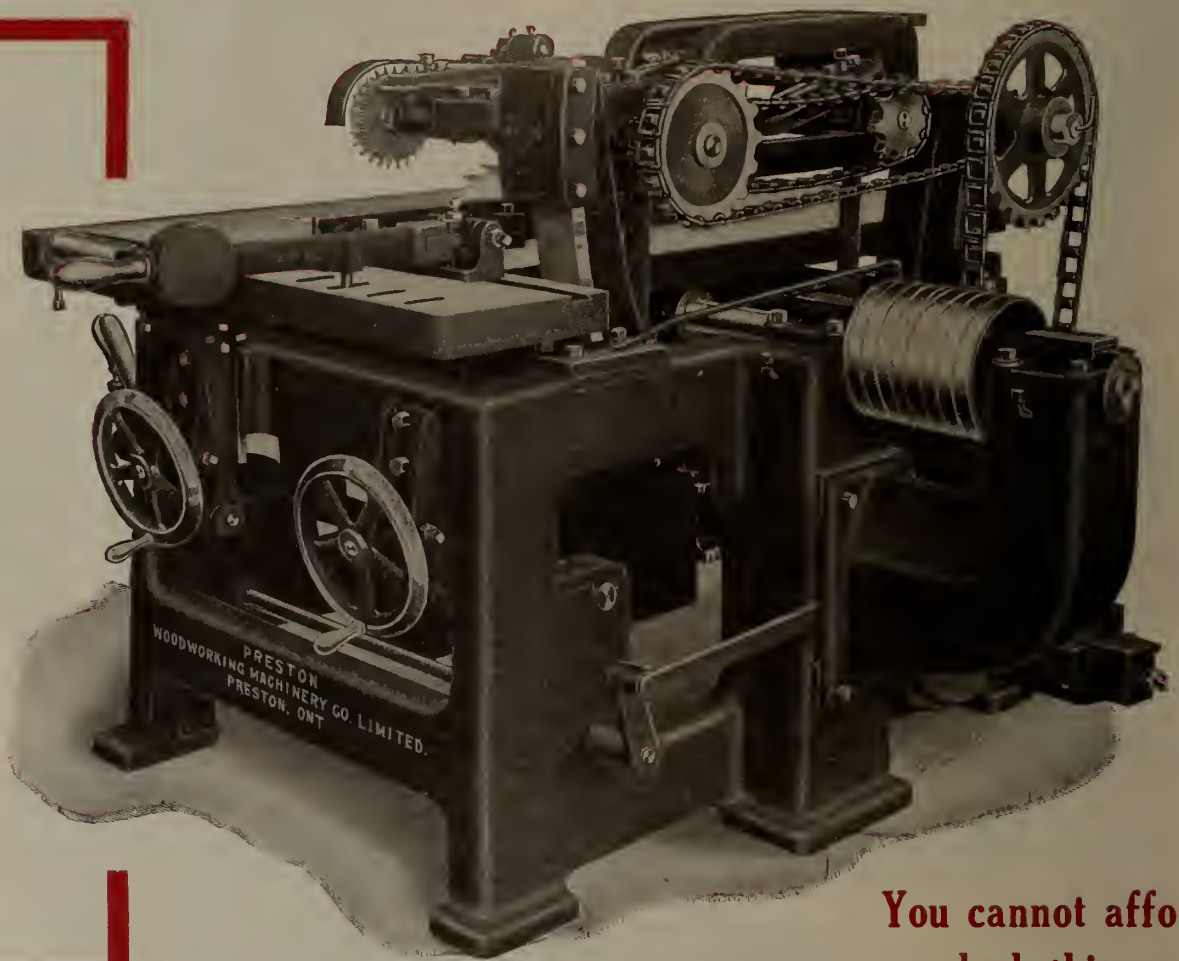
"PRESTON" No. 129 Power Feed Rip Saw



You cannot afford to overlook this machine

A thorough investigation of the predominating merits of the "Preston" No. 129 Power Feed Rip Saw will prove what we say—the installation of one of them in your plant will be one of the best investments in machinery you ever made.

In design and construction it is made to give the utmost in service and capacity. The frame is in one solid casting, each bearing self oiling, table and upper works easily adjusted by hand wheels and quickly regulated variable feed.

Our Catalogue describes it

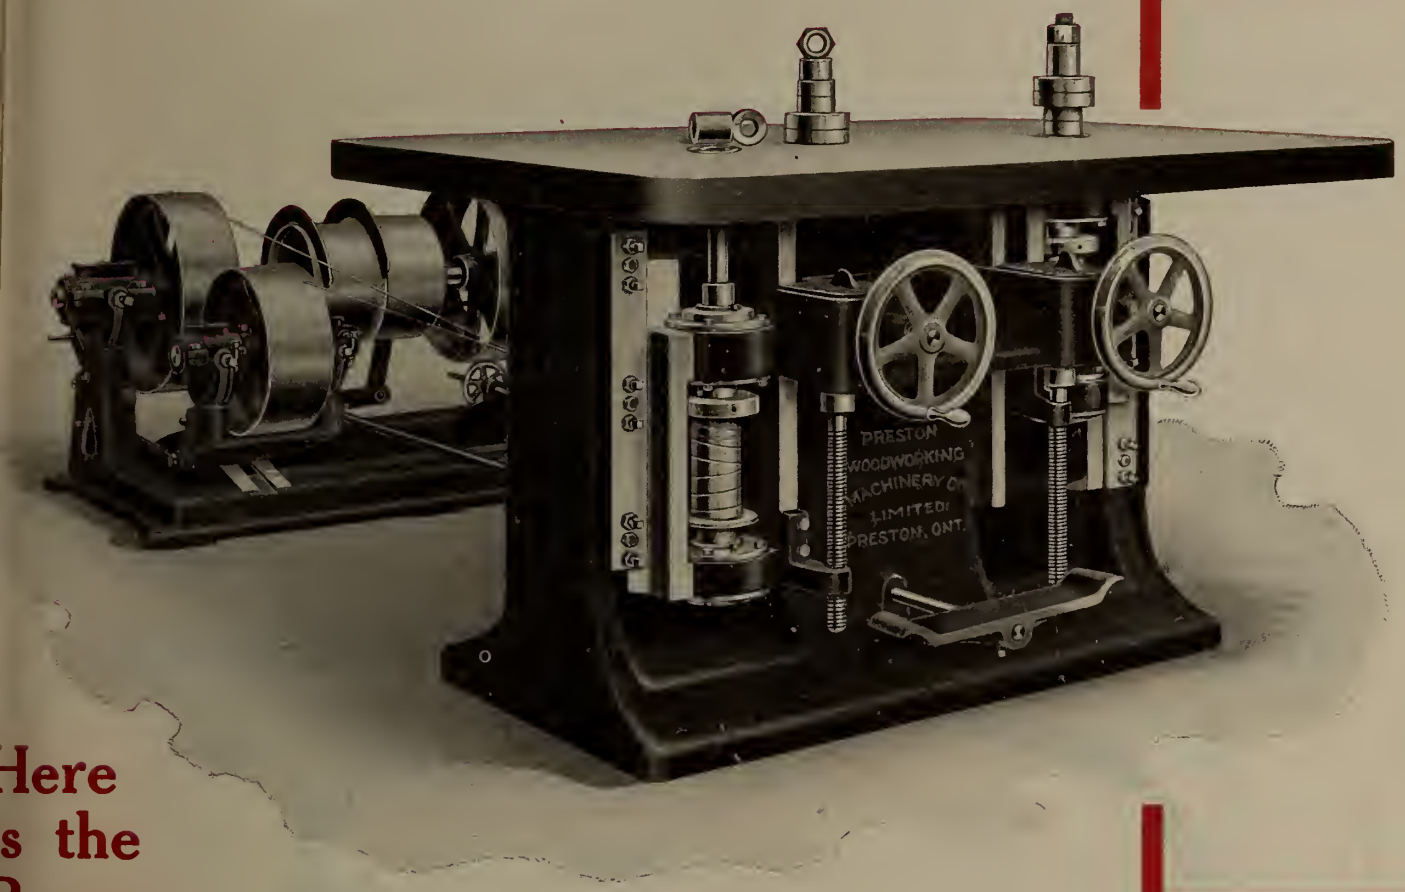
The Preston Woodworking

PRESTON

If You Need a New Shaper

It will pay you to get a

"PRESTON" No. 162



Here is the Reason

It is the best all round shaper on the market, designed and built by the pioneer shaper people of Canada. It is equipped to handle the heaviest kind of work as well as the smaller jobs.

Here are some of its chief features that have won for it the high esteem of the Canadian Woodworking industry: SKF Ball Bearings; 7,000 to 8,000 R.P.M., Single or Double Spindle as desired; High Speed, absolutely under the control of the operator; and a shipping weight of 2,750 lbs.

This shaper, along with our complete line of our "Better" Woodworking machinery, is completely described in our catalogue. Have you a copy of it? If not let us send you one.

BELT SANDER 319

CONVENIENT, SIMPLE, SUBSTANTIAL, EFFICIENT. TABLE 5½′ or 8′.

COWAN & COMPANY OF GALT, LIMITED, Galt, Canada

What Does Overhead Mean to You?

It probably means administrative expense, rent, insurance, etc.—unavoidable expense, other than labor and materials, that adds to the cost and decreases the profit on every article manufactured.

But to S K F Bearing Engineers overhead also means FRICTION—an invisible drag on machinery that reduces plant efficiency and cuts deep into dividends. For in the average mill, friction destroys at least 25 per cent. of all the power produced or bought.

Yet this enormous waste can be largely eliminated through the aid of our Consulting Bearing Engineers—salesmen only as they serve.

This S K F service is part of a laboratory-built ideal that seeks to co-operate with the manufacturer and furnish advice of a practical and impartial character. The fund of knowledge constantly available in the S K F Research Laboratories is applied to your particular problems in order to cut down that unnecessary and costly overhead caused by friction.

Manufacturers are invited to avail themselves of this bearing service at any time

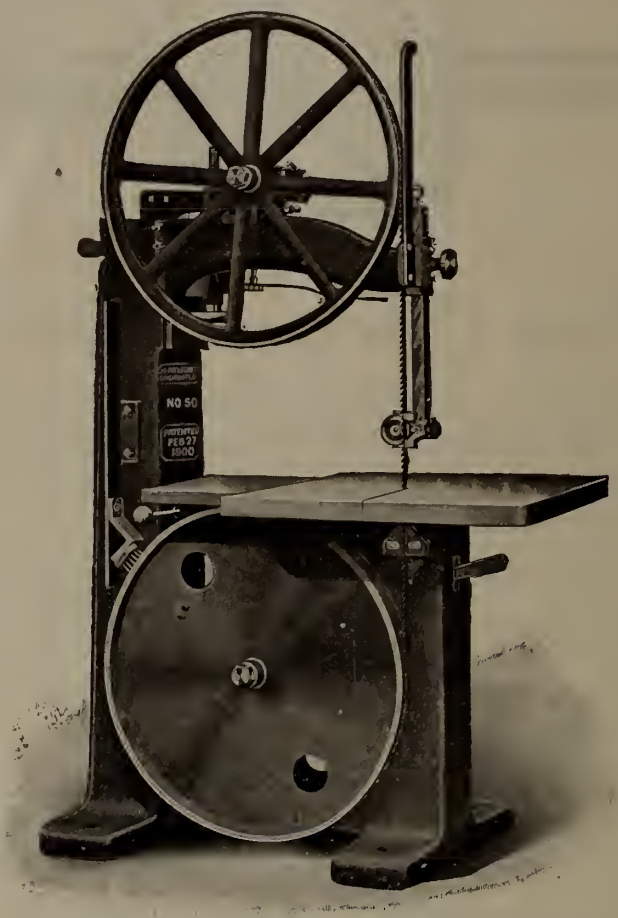
Gronkvist Chucks
Transmission Hangers



Save 25% to 50% of Blade Upkeep and Power Cost
Get Two, Even Three Times As Much Work

It's not the blades that wear out that cost, it's those that break.

It's the broken blades that cut down productive time and cost to repair and to replace.

Blade breakage is reduced to a minimum on Fay-Egan No. 50—36" **Square Column "Lightning Line" Band Scroll Saws.**

The Fay-Egan "Knife Edge" Blade Tension, made on the principle of a fine laboratory balance scale, is so sensitive that it compensates for changes in atmospheric conditions—yet, so flexible, you can pass a block between blade and wheel, while running, without breaking the blade. Folks tell us blade expense on "No. 50" averages 50 to 75 per cent. less than on the old timers.

The solid lower wheel acts like the fly wheel on your engine, its momentum carrying the load, so that the power consumption is reduced fully one-half, while at the same time it controls the light-spoked upper one, preventing over-running and choking down on a heavy cut.

The heavy square column eliminates vibration and permits the wheels to be revolved at 50 to 100 per cent higher speed, increasing the cutting capacity to double, and in some cases, triple that of the ordinary band saw.

As a user of saws, you cannot afford to ignore what Fay-Egan Square Column Band Saws are doing for others and can do for you. An investigation does not obligate you.

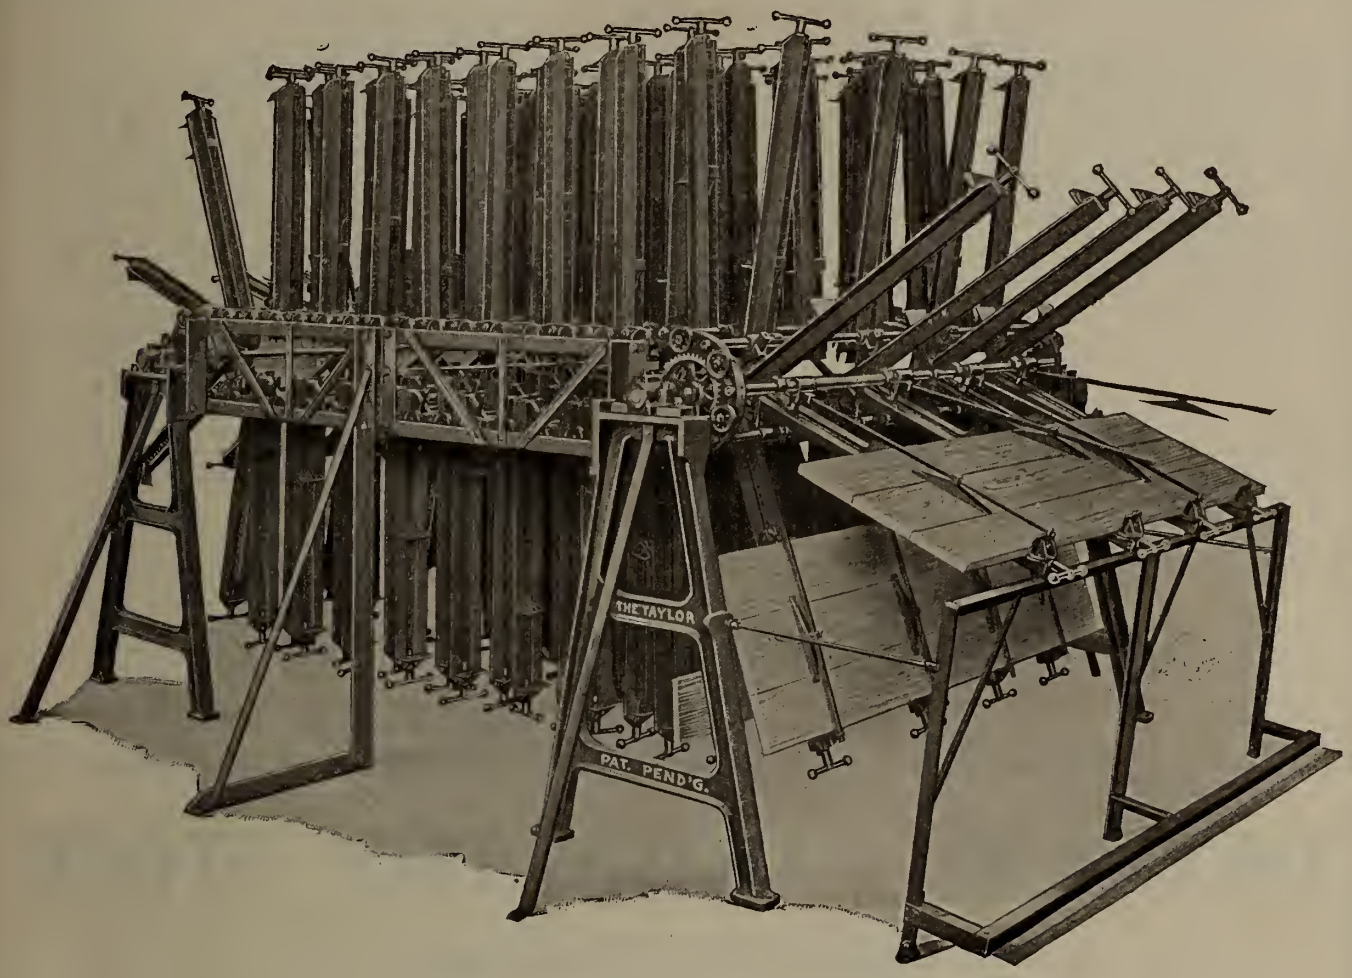
153-163 W. Front St. **CINCINNATI, O.**

CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

REASONABLE PRICES—that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

RED GUM

"AMERICA'S FINEST CABINET WOOD"

The really successful merchant, it matters not in what line, is he who takes the trouble to ascertain

WHAT THE PUBLIC WANTS

This is especially true in its application to the furniture manufacturer and his retailer. He *has to* study his public—or he soon will have no public.

That portion of his public which is influenced by the principles of good taste wants RED GUM furniture—Why? Because the color, grain and soft, velvety quality of this, the finest of America's cabinet woods, when handled by a master cabinet-maker, results in a thoroughly charming piece of furniture—the kind that people of nice discrimination like to have around—and want strongly enough to *ask for*. Then can YOU supply it?

Makers and dealers desiring to see samples of RED GUM, both rough and finished, are invited to correspond with us at once.

ADDRESS: RED GUM DIVISION

"YES!" IS THE WORD FOR AMERICAN OAK TODAY!

to ALERT FURNITURE MAKERS: "A WHISPER IS ENOUGH"

From FILING CABINETS and other Office Furniture to "the bones of great ships"—OAK is **OAK.** (Supreme.)

From ***DELICATELY CARVED FURNITURE*** for the ***DILETTANTE TASTE*** to the sills and ribs of great structures whose nobility is in their sheer strength (and to the historic beams of Westminster Abbey) OAK is **OAK.** (Supreme.) ***GOOD*** **OAK FURNITURE is "COMING *IN.*"**

Without a rival, without an apology, without a substitute, OAK is indeed

"*The* WORLD'S PREMIER HARDWOOD"

(has been, is and ever shall be), AND EVERYBODY KNOWS IT.

Nature will never grow another wood as good as OAK for the uses for which it is historically appropriate.

No need to mention Economy—*you know it.*

AMERICAN OAK is PLENTIFUL, ECONOMICAL, INDISPENSABLE.

ADMIRE IT. TRUST IT. INSIST ON IT. ***SPECIFY*** *IT. USE IT.* WRITE us. TELL us. ASK us. *We will give you a Straight Personal Letter in prompt reply—WITH ALL THE FACTS.*

Address: Oak Division,
AMERICAN HARDWOOD MFRS. ASSOCIATION
1408 BANK OF COMMERCE BLDG., MEMPHIS, TENNESSEE

The Hotel Pennsylvania Used Walnut

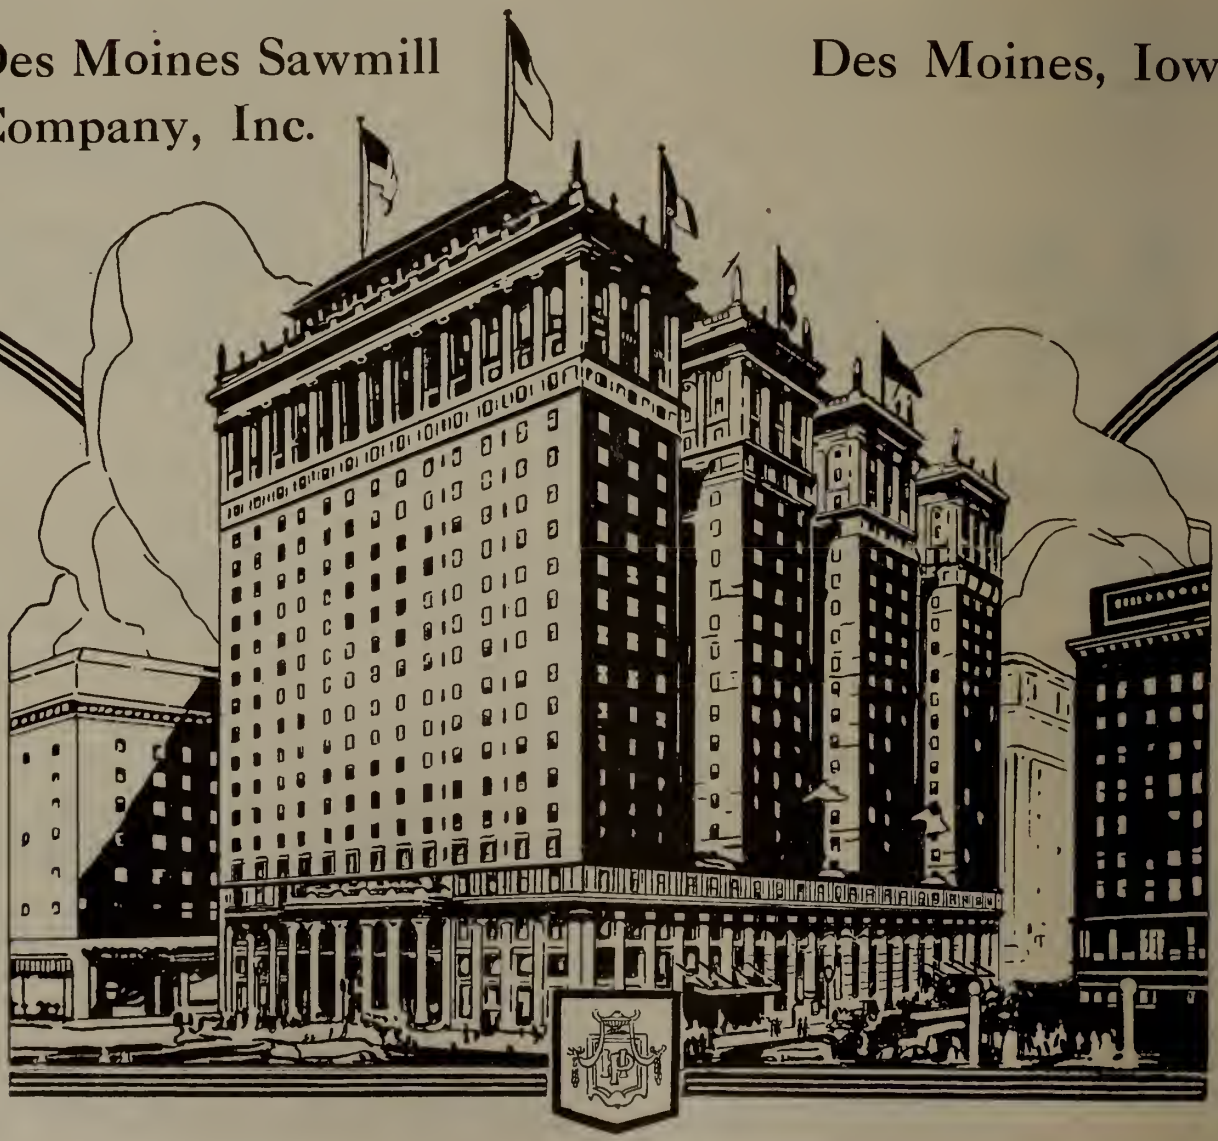
They selected American Walnut because they believed it to be the most practical and yet the most distinctive wood obtainable. Later they confirmed their own judgment by consulting the preferences of the public they serve. The management in a recent statement say:—

> "The fact that we have chosen Walnut as a furniture wood and for the interior trim for the largest hotel in the world, and a hotel which is designed for New York's most discriminating hotel patrons, speaks for itself. Could we say more?"

Use Walnut for all furniture and interior trim and especially insist upon the Iowa variety in both lumber and veneers.

Des Moines Sawmill Company, Inc.

Des Moines, Iowa



"Hartzell's Choice Walnut"

Are you a believer in the fact that

"Quality Counts"

Have you ever experienced that delightful sensation of accidently overhearing a person speaking in a complimentary way of the "Quality of your Product."

"We emphasize Quality"

If your finished product is made from Hartzell's American Walnut Lumber and Veneers you will have the last word in "Quality"

There is a difference and it will pay you to think it over.

Samples submitted and quotations made upon application.

Our Motto is
"Satisfied Customers."

An American Walnut Tree Selected For Our

LUMBER

PURCHASING AGENTS:—

Owing to embargoes and shipping delays, it is practically necessary for purchase orders to be placed thirty days earlier than in former years—we think this is especially advisable in Walnut today.

The years of experience of our buyers and the time and care used by them in selecting the raw material, for our output, terminates in the high character and quality of our lumber.

ASTORIA MAHOGANY

LUMBER & VENEERS

"Astmahco" No. 3, returned from Central America, discharging Mahogany logs at the cribs adjacent to our mills, Long Island City.

Two Sister Ships Join the Astoria Fleet

Recognizing the frequent inability to secure sufficient bottoms for the transportation of our required volume of Mahogany logs we have recently added two modern ships to the Astoria Fleet.

Backing up the promise to serve with the ability to fulfill the promise has, over a period of nearly fifty years, made us the Country's largest organization devoted to the production, manufacture and distribution of Mahogany Lumber and Veneers.

WE are pleased to announce the organization of The Frank A. Conkling Company, recently formed, with offices located in the Randolph Building, this city.

While appearing under a new name, the members of our organization are not unknown to the trade, having all been engaged in the Hardwood lumber business for a number of years.

We will specialize in Southern Hardwoods, particularly Red Gum and Quarter Sawed White Oak. Our band mill at Percy, Miss., is operating daily and we are accumulating a well assorted stock. We have behind this operation one of the best tracts of virgin timber located in Mississippi and are constantly acquiring additional timber, thus assuring the operation of our mills for years.

All departments of our organization will come under direct supervision of experienced management, thus assuring prompt and satisfactory service to our patrons.

AMERICAN WALNUT

"The Cabinet Wood Superlative"

Little Doors That Open

(without sticking) after centuries of use.

There are little doors—and hidden drawers—that were fabricated 200, 300, 400 or more years ago. Some of them are supposed to open at the light touch of a delicate finger (with rare jewels on it). Some of them may stick (Oh, heavens!). BUT—*some of them are of WALNUT.*
The Walnut ones don't stick, nor jam.
Everybody is glad to know that cabinet-work of that supreme hardwood is still being made—by artisans who are indeed artists. Would you believe it? It is *true!*
Ask your furniture dealer—if you hope (as of course you do) that the furniture you buy today shall become the treasured heirlooms of your great-grandchildren.
"Walnut is Walnut"—there's no getting away from *that.*

The American Walnut Brochure, de luxe, is ready. May we have your written application? (Promptly answered.)

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION
Room 1019, 616 South Michigan Boulevard, Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

THERE ARE STILL A FEW FURNITURE HOUSES IN THE COUNTRY

who are giving their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. *Let them ask us for THE FACTS!* (See address above.)

The New Sales and Luxury Taxes

The excise taxes and tax regulations as brought down recently by the Canadian Finance Minister, Sir Henry Drayton, in his budget, and made applicable on and from May 19th, 1920, are still a subject of general conversation. In every gathering, on every street and, in fact, everywhere one goes the luxury or sales tax is sure to crop up. The different clauses of the regulations and their application are criticized with more or less heat, depending largely on how they effect the pocketbook of the person speaking.

So many interpretations have been placed on the different taxes and so many diverse rulings have been made that even at this date the application of the various clauses are little known and little understood. To make matters worse it is proposed to bring down certain amendments, the nature of which are not fully known, that, it is understood, will lower the rates on certain articles and impose taxes on others which were not affected in the first instance. In view of this it might be well to discuss the taxes with reference to their application to the woodworking industry.

The first item to consider is that the special war tax of 7½ per cent. which has been collected on the invoice value of all importations is removed and in its place a sales tax of 1 per cent. is to be collected, in addition to existing customs and duties. Thus imports of unmanufactured lumber, that is, stock from the saw, which at one time were admitted into Canada free of duty, and which of recent years were subject to the 7½ per cent. war tax, will be admitted on the payment of this 1 per cent. tax. The same applies to machinery, supplies, finishing material and other similar items. The 7½ per cent. war tax has been lifted and the 1 per cent. tax imposed in its place.

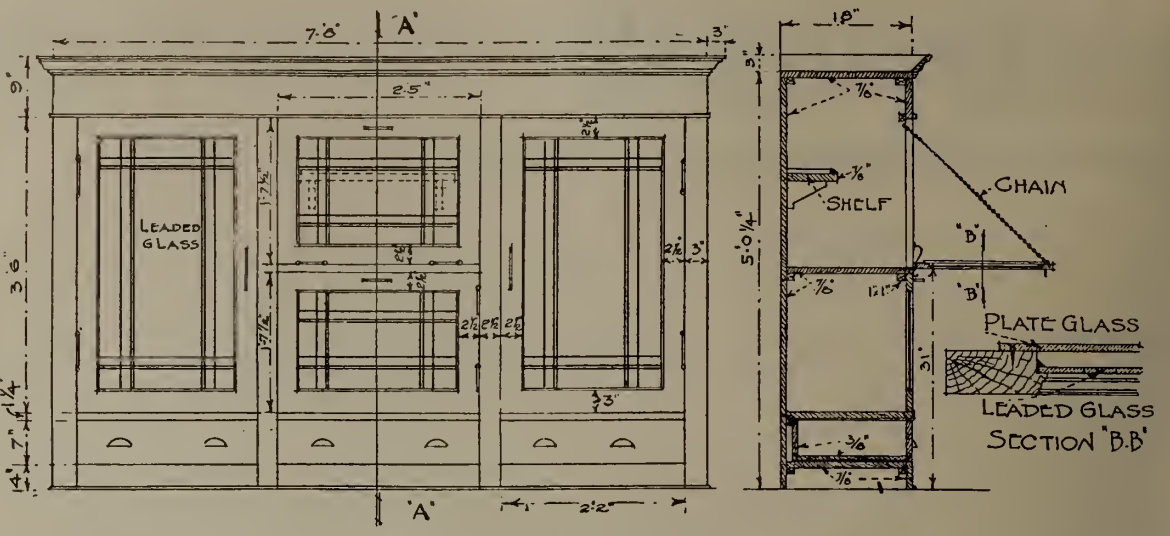
As an instance woodworking machinery has been subject to a duty of 30 per cent. on the invoice value plus the additional duty of 7½ per cent. Under the new regulations the same equipment would come in under a duty of 30 per cent. and the special tax of 1 per cent. This works to the advantage of the American manufacturer and exporter as it removes what really amounted to an additional protection of 7½ per cent. for Canadian industries

The same tax of 1 per cent. is to be levied and collected on all sales by manufacturers and wholesalers. The enactment includes that the purchaser shall be furnished with an invoice showing the amount of the sale and the amount of the tax separately, when not included in the purchase price; that this tax must not be included in the manufacturers or wholesalers costs on which the profit is calculated; that this tax be collected from the purchaser at the time of the sale and remitted to the government in accordance with regulations which may be brought down later. Under recent rulings the operators of sash and door factories and planing mills are classed as manufacturers so that the tax of 1 per cent. must be collected on all sales by furniture and musical instrument manufacturers, planing mills, sash and door factories and other plants manufacturing wood products. In addition these manufacturers will be called on to pay the 1 per cent. on all purchases from wholesalers and other manufacturers.

The piano and phonograph manufacturing industries were hit specially hard by a tax of 10 per cent. on pianos and organs (not including pipe organs) and 20 per cent. on player pianos, phonographs and records. It is understood that under the new amendments which are being considered these levies will be reduced considerably.

Other woodworkers affected are builders of boats, yachts, canoes and motor boats, which are subject to a 10 per cent. tax, payable at the time of the sale. A refund will be granted when it is shown that these boats are to be used for trading and commercial purposes only. Manufacturers of sporting goods are taxed 10 per cent. on such articles as skis. toboggans, canoe paddles, baseball bats, billiards and pool tables.

Furniture was not originally included in the list of articles subject to the luxury tax, the government, no doubt, considering that Canadian furniture, in the main, was not a luxury. It is now proposed to bring in an amendment which will include some of the furniture which they have considered to be in the luxury class, such as antique furniture in costly woods, also other furniture in ebony or teak wood and lacquered furniture, also expensive ornamental or inlaid furniture and tables made specially for games. Liquor cabinets, smoker cabinets, tea waggons, sewing tables, piano lamps, stands, table lamps, jardinieres, pedestals and brick-a-brack made of rosewood, prima vera, solid mahogany, ebony or lacquered or decorated are taxable when made in the woods and styles mentioned.



Convenient combination built-in bookcase and writing desk. Note plate glass on drop shelf

Utility and Convenience in Built-in Furniture

Built-in Features not Confined to Living and Dining Rooms—Contribute to Home-like Appearance of Rooms—Would Improve Many Parts of House.

By H. C. Smith

A house is but partly complete that lacks the built-in features, which when properly designed and placed, become permanent pieces of furniture. add an appropriate artistic touch to the interior treatment and, what is well worth considering, greatly reduce the cost of furnishing.

Many years ago, when most people owned their own homes and lived in them from birth to death, built-in furniture was a usual and essential feature. These utilities created a sense of permanency; they were certain indication of ownership. There was no question of doubt as to the permanent placing of a cupboard or a settee; no question in the mind that their many advantages might be reaped by some succeeding tenant. This built-in furniture literally grew into the fabric of the building and so complemented the domestic convenience as to become an essential element.

There has steadily grown a tendency in the modern house, particularly of moderate cost, to avail of all the various opportunities where built-in furniture can be with advantage located. Probably the dining room, kitchen and library will be the rooms where these features will be more generally found, but the entire house may receive attention with a view to installing built-in conveniences.

China Closets and Sideboards

Closets for china are logically located in the niches formed on either side of the dining room chimney breast. These closets should be in their general aspect, in accord with the trim of the room and treated as their finish in the same way. They may be built low, so as to afford a top that will be convenient for placing decorative jars, or that may be used for the tea and coffee services of such pieces of cut glass as the housewife will pridefully desire to display. These closets may further find a suitable location in the corners at either side of wide windows and above window seats, another type of built-in furniture which may be constructed so as to afford storage for such articles as may properly be placed there.

The most important piece of built-in furniture in the dining-room will be the sideboard. As a matter of fact one of these permanent side-boards presents many advantages, not only from an artistic viewpoint, but also on the score of utility, that are not shared by the usual movable type, generally but indifferently designed and but a makeshift of convenience. More and better closet space and drawers are provided by built-in-types, and when the overhead closets are added, as shown in the illustrations accompanying this article, there is created a very decidedly advantageous feature of economy and efficiency.

Conform to Decorative Features

In the living room, built-in bookcases, low in height and forming a part of the "interior finish," always suggest an air of good breeding and make this important domestic centre a most livable place. These cabinets may be utilized for other purposes than for books, and when the glass fronts are screened by some well-chosen fabric a convenient place is formed where the young people may store away tennis rackets, golf clubs and all the various impedimenta unfortunately often strewn about the house, and serving as a trap during darkness for some unwary one. Window benches with lidded seats are attractive and cozy things to install.

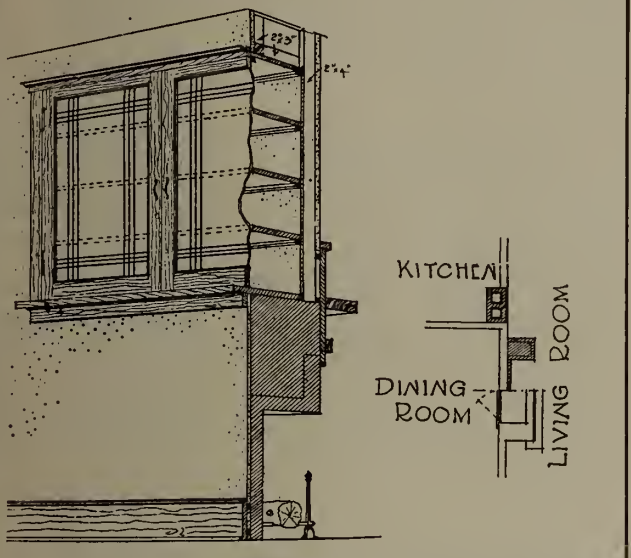
The feature of the modern living room about which the family congregates during long winter evenings or cold and rainy days will be the fireplace. It is just here that a most artistic and desirable placing of built-in furniture may appear. Wide-seated settees with high backs to screen from drafts are appropriate, and they form a place where the older people may sit in semi-seclusion from the noisier younger element. In fact, it would seem to be certain that built-in furniture gives an added charm to the domestic atmosphere. This charm becomes in reality

a part of the house in a truer sense than it is possible to attach to those other pieces of furniture that are movable and which are constantly changing their location.

Kitchen Pantry Done Away With

The modern, well-appointed kitchen is one where built-in furniture has been completely installed to the elimination of the pantry. Closets, cupboards, bins, drop tables and window seats may all properly be placed in the kitchen. The very character of their construction makes for easy cleaning and therefore a better and much-to-be-desired sanitary condition. This feature is equally true of the bathroom. Here linen closets and a window seat may be installed and finished in white enamel, to be in keeping with the porcelain accessories. The effect is one very much to be desired and the first cost, if introduced at the time of building, is no more than would be entailed by the purchase of any of the many things that are sold for modern bathroom equipment.

Unfortunately the modern house is not provided with the closet space that the housewife regards as



China closet constructed over fireplace

necessary to serve the ordinary necessities. There are never enough wardrobes or places where clothes in constant use may be hung against dust and damage. These places are logically in the bed chambers. It is almost always possible to find space for shallow built-in wardrobes. These, like the bookcases in the living room, may be only sufficiently high to permit of hanging skirts and coats or may extend from floor to ceiling with an overhead closet and a mirror let into the panel of the doors. The amount of comfort, convenience and saving that these built-in wardrobes afford is very considerable, and they will repay the moderate outlay necessary for their construction.

Cellar Not Overlooked

Let the cellar not be forgotten when built-in furniture becomes a first sanitary necessity. Here, where coal and ash dust is ever present, there is seldom given the serious consideration to proper closets of bins that there should be. The season's "canning" will be stored here and, in fact, all the impedimenta of the household laid aside for use until the return of certain seasons. Properly speaking, the cellar should be divided so as to form a room that would be dust-proof and contain convenient features.

There are no limits to the directions in which the "handy man about the house" may turn his efforts when he has made his house a home by these methods, provided every simple convenience that will suggest itself in the interior, he may find opportunities out-of-doors on the porches and verandahs. Here there might be built substantial benches, a closet for garden tools and often—a small cupboard where the milkman can leave the milk, the paper man his paper, and the tradesman the various parcels, safe from the depredations of the prowling cat and the ever-hungry dog.

The owner of the low-cost house who is able to use tools will find a constant source of satisfaction in constructing built-in furniture. Particularly if his daily work is of concentrated mental effort will this home carpentry appeal to him, for who does not know that rest is not absence of occupation, but the doing of something different from the absorbing daily activities of bread-winning.—Building Age.

Flooring Completely Finished at Plant

Matched flooring as it usually arrives at the building where it is to be laid has received no finish with fillers, oil, varnish, or with any other material. It has made the journey through the planing mill, has been properly dressed, grooved and tongued but the wood is generally in the natural condition, and it remains so until it has been laid and nailed. After that, it may be scraped, rubbed, or otherwise cleaned, and then the filler, varnish or wax is applied to make a finished job.

An American hardwood flooring manufacturer has been for the past two years finishing all the flooring at the factory. It is claimed that this material may be put down and made ready for use in a single day.

All applications of finishes and oils are attended to in the factory. Not only is the upper or wearing surface given such treatment, but the under surface is also oiled. Of course, no one sees the under side of a floor after it is put down, but the oiling is not done for appearance, but for the purpose of waterproofing the wood. A floor may be in perfect condition when laid, but it is likely to absorb dampness afterwards, and this dampness enters from below as often as from above, and more frequently if the under side of the flooring strips is unprotected.

The flooring is uniformly ⅜ of an inch in thickness, but strips are made in two widths, 1½ and 2 inches. It is shipped from the factory in bundles of twenty-four pieces, packed face to face, with the bundles clamped tight and bound. This is done partly for convenience in shipping, but more as a means of keeping the strips clean.

The nailing is done in the manner common with most matched flooring; that is, the nail is driven at the base of the tongue and neither the head nor any part of the nail is visible when the floor is laid. Holes through which to drive the nails are punched by machinery while the strips are passing through.

Many advantages are claimed for this flooring, one of which is the speed with which floors can be made ready for use. The carpenter does the last work. No oil mop or varnish brush follows. A room a day is the speed expected of a carpenter. The foundation on which strips are laid is the same as that for any other good floor.

Fig. 1—A group of houses designed for Trenton, Ont., Housing Commission by Wm. Lyon Somerville, Architect, of Toronto

Building Utility and Comfort in a Home

Study of Different Plans Brings Out Many Interesting Features—Lighting and Ventilation Given Greater Attention—Rooms Planned to Utilize Stock Lengths

THE study of the types and designs of houses that are being erected by the different housing commissions throughout Canada affords an interesting insight into the trend of architectural design and economical construction. When judging the fitness of any plant there are many points which it is advisable to consider. First of all there is the general appearance of the finished structure. While the quantity construction of houses in groups does not allow for a very wide variation in design, or for designs that might be termed fussy, yet the houses must be attractive in their simplicity.

Not only must the houses be attractive, but comfort and convenience must not be sacrificed to economy. Thus the architect who succeeds in preparing acceptable plans is of necessity forced to study the best ideas in community construction and exercise a fair amount of originality as well.

The illustration accompanying this article show sketches and floor plans of some of the houses which are now being erected by the housing commission of Trenton, Ont. These were designed by Wm. Lyon Somerville, of Toronto. Those shown are four and five room detached residences. The exterior of the

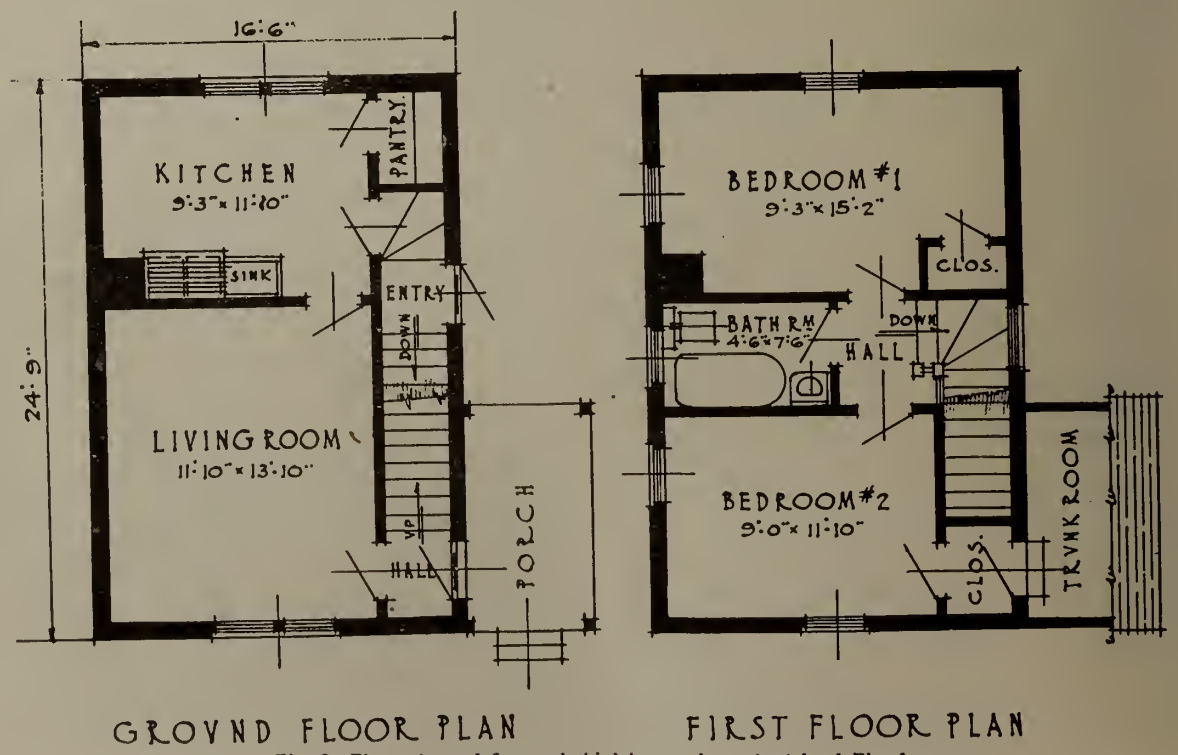


Fig. 2—Floor plans of first and third houses from the left of Fig. 1

houses are varied and the buildings laid out in groups or staggered rows so as to break the monotony and regularity of layout and design so often noticeable in large building schemes.

The four-room residence, which is shown on the right, is a two storey house 16 ft. 6 in. by 24 ft. 9 in. with two good sized rooms on each floor. Entrance is made from the side porch into a very small hall, having a door opening directly into the living room. This room is used as a combination living and dining room.

The grade entrance provides a particularly desirable form of rear entrance. It is convenient to the kitchen, yet gives direct access to the basement. Ashes, vegetables, etc., may be carried up and down without a lot of dirt being tracked through the kitchen. The same idea is embodied in the five roomed house.

Light and ventilation are well provided for by the number, size and location of the windows. In the warm weather, the windows in the front and rear may be thrown open, creating a movement of air that will tend to keep the house comfortable. The second floor may be ventilated in the same way. The upper story consists of two bedrooms and bath room. Here again the hall space is reduced to a minimum. The conservation of space effected by reducing halls and eliminating all waste tends for lower construction costs, less house work and better value for the money expended. On the other hand, it will be noticed that closets and pantries are included wherever needed.

The five-roomed house, while the layout is entirely different, will be found to embody the same ideas. It will be noticed that the same effort was made to reduce waste space, save steps and give a maximum of comfort and convenience. The large shady porch adds to the cosy appearance of the house and should prove particularly attractive during the warm summer evenings.

The lines of this house, which is the second from the right, are the long, low, horizontal lines which are so suggestive of cosiness and comfort. One is immediately attracted to a home of this type. The attraction may not be very well defined, but there is usually the thought that it would be nice to own or live in a house like that.

Those who have made a study of home planning and attractive homes have found that the embodiment of a few long, unbroken, horizontal lines give a cosy home-like appearance that cannot be conveyed in any other way. This is well illustrated by the accompanying sketches. If a choice of one of the houses shown here were to be made there is hardly any doubt as to which type the majority would decide on, with little or no hesitation. This is a point that might well be remembered when working out a design for a home.

If this house were to be built where adequate lighting were to be had on the four sides, the insertion of an extra window in the end wall of the living room and another in the kitchen would be a real improvement. It is desirable where possible to have windows in two walls of a kitchen. The average kitchen is not supplied with an over abundance of light, if such a thing is possible, so that while improving the lighting of this important room, an additional window would tend for better ventilation, as a refreshing current of air could be induced by opening both windows, making the kitchen a more comfortable place to work in.

It will be noticed that most of the rooms are odd sizes, such as the living room 11 ft. 4 in. by 15 ft. 10 in. This is partly by design, as in many cases it enables stock lengths of material, such as floor joists, to be used without waste or cutting—another point that tends for lower costs.

It is just this attention to little things, like the size and utility of the rooms, the cutting down of halls

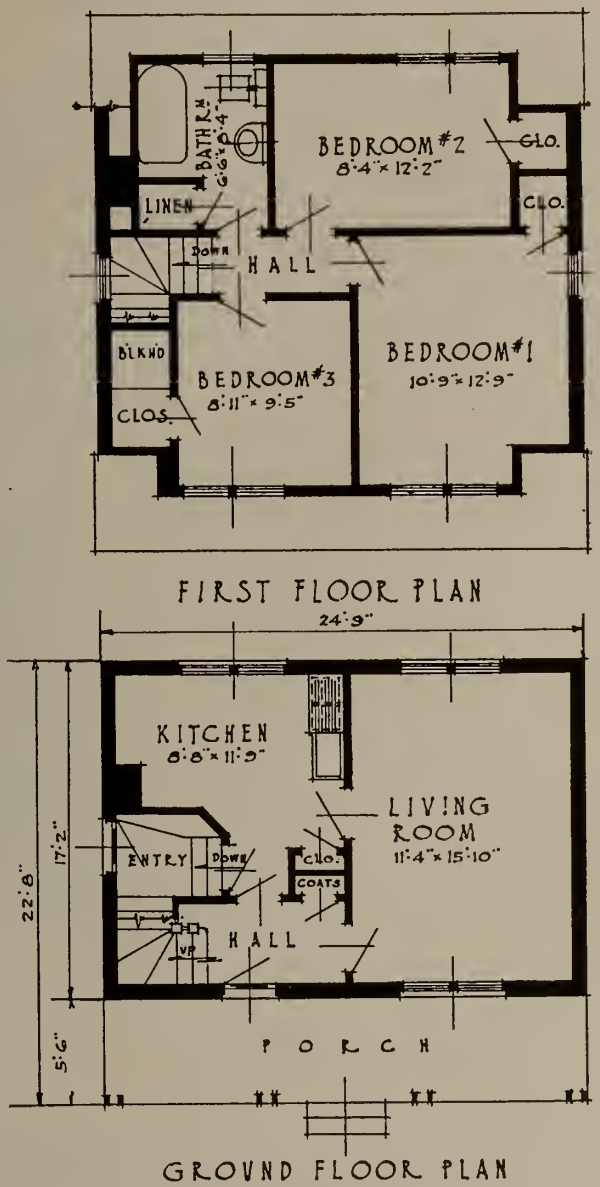

Fig. 3—Plans of second and fourth houses from left of Fig. 1

and other little used space, the lines and outside appearance of the house that, while adding to the desirability of the finished home, often lowers the cost of construction many hundreds of dollars.

Motion Pictures of Piano Industry

A moving picture film was recently taken in the Williams piano factory, Oshawa, Ont. This shows the different operations in the production of pianos from the receipt of the rough lumber to the finished product. The picture was taken under the direction of the Department of Trades and Commerce, Ottawa, and is intended to be shown in foreign countries in an endeavor to assist Canadian manufacturers in securing export business. It is just possible that this will be thrown on the screen at the Canadian Industries Exhibition in London, Eng.

Aggressive Move By Furniture Makers

Furniture Manufacturers Decide on Well-Organized, Far-Reaching Publicity Campaign—Retailer to be Assisted in Extending Market—Outline of Conditions Prevailing in Industry

A successful, well attended general meeting of the Furniture Manufacturers' Association was held in Toronto on Thursday, June 10th. This meeting, which was the culmination of a number of district meetings, was called primarily, to discuss the question of a publicity campaign.

Wm. Cawkell, the secretary, addressed the members present, at some length, in regard to the inauguration of an advertising section of the Furniture Manufacturers' Association. The object of this department would be to strive to create a stronger desire throughout Canada, and especially throughout the rural districts, for better furniture and attractively furnished homes.

An open discussion ensued, speeches being made by many members supporting the idea. It was unanimously decided that the scheme be gone ahead with and that the advisory publicity committee which consisted of G. W. Gibbard, J. H. Baetz, A. A. Schreiter and Geo. Hughes, with W. J. Anderson, the chairman of the Association, be made a permanent one with full power to engage a high class publicity man and organize the department on an efficient line. An adequate pro rata levy will be made to cover this branch of the Association's activities.

The new departure is a very important one and is in line with similar movements being inaugurated by furniture manufacturers' associations in the United States. It is anticipated that very shortly the whole community will be brought to realize the satisfaction and desirability of an attractively furnished home and to the fact that there is as much style to furniture as there is to clothes and automobiles. The committee made it plain that they considered that the successful maintenance of community life is dependent upon the attractiveness of the homes of the people and the taste they display in furnishing them. A tastily furnished home is not only a joy to those who live in it but to all visitors who enter its portals.

The prevailing idea that furniture is bought to last a life time must be uprooted. Many a person who thinks nothing of buying a new automobile every year or so seems content to live in a house filled with furniture that is out of harmony with present day homes and present day standards. Show them, by means of attractive booklets and bright seasonable advertising how they can furnish their homes so that they will be proud of them, teach them to appreciate the beauty and harmony of artistically furnished rooms and a steady enhanced demand for better furniture will naturally follow.

When one stops to consider, this is one of the most economically marketed products in our commercial life. While most commodities are handled by from three to half a dozen middlemen before reaching the ultimate consumer, furniture goes direct from the manufacturer to the retailer and thence into the home. This is a feature that should be kept before the attention of home owners.

While it would be premature to outline the service to be rendered the furniture dealers by the manufacturers as full details of the scheme have not been fully worked out, the "Canadian Woodworker" has been informed that the present intention is that the dealer shall receive every assistance in his advertising and publicity work that it is possible for this bureau to give and that such services shall be absolutely free. In addition a large amount of general advertising will be done in a systematic and thorough manner by the Association. This publicity will be directed so as to reach all sections of Canada and to appeal to all classes of the community.

The whole idea will be broad and thorough in its scope and nothing will be overlooked that might add to its effectiveness. There is no doubt but that this move by the furniture manufacturers will bring about closer co-operation and increased advertising efforts on the part of the retailer and that the whole industry will benefit as a result.

In a general discussion on the probable situation for the next few months it was thought that no amelioration of present conditions need be expected. The cost of raw materials will likely remain at present high levels, with a marked difficulty in securing many items. The Government reports show the cost of living to be mounting higher and higher.

The demand for furniture eased off slightly during the past month. This was not altogether unexpected as this is one of the quiet seasons. Shipments were well maintained during the same period, in fact were above normal. The orders on the books of the different manufacturers are slightly in excess of the amounts usually carried and are sufficient to keep the plants running for some months to come.

Reports received from retailers indicate that business is offering in a very satisfactory volume. The fall demand will be influenced largely by the harvest. So far all reports are favorable. A good crop would ensure an enormous demand for furniture from all sections of the country.

A motion was carried that representation be made to the Government asking that the standing and qualifications of the authorized trustees to be appointed under the new bankruptcy act, which comes into effect on July 1st, be carefully scrutinized and that a copy of this resolution be forwarded to the authorities at Ottawa.

The July Furniture Exhibitions

It is probable that many of the furniture manufacturers will hold a midsummer exhibition in July. Practically all the Kitchener furniture men have decided to exhibit for two weeks from July 5th to July 17th, and have sent out an invitation to the retail furniture trade, asking them to visit the exhibition and promise a good showing of the latest productions, including some new lines. This is the second season for the Kitchener manufacturers to hold a midsummer sale. They were so well satisfied with the results accruing from the July exhibition of last season that they consider it well worth the trouble and expenditure.

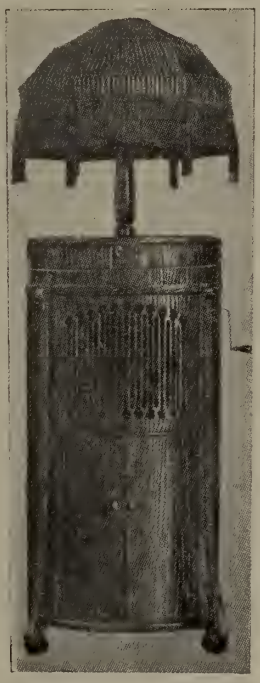
What Other Manufacturers Are Doing

New Ideas in Furniture—Round Phonograph with Parlor Lamp Attached Distinct Novelty—Special Floor Lamp for Twin Beds

By W. Arthur Lynn

New ideas and designs in furniture and house furnishings are being placed on the market in an almost continuous stream. Many of these articles are nothing more or less than freaks, freak in design and freak in construction, and have little to recommend them to the buying public. Other new pieces are more attractive, showing considerable ingenuity in construction and design. Some of these ideas are capable of wide adaptation, and it is with this idea in mind that this article, describing a few of the latter class, has been prepared.

Probably one of the most radical departures from conventional design is that of a circular or round phonograph, with parlor lamp attachment. The accompanying illustration shows this instrument. The makers claim that this departure from the common type of machine is responsible for the demand which exists for the round instrument. There may be something in this claim for the conventional type is seen in so many homes that a departure from the usual style might appeal to the fancy of those who want, and are willing to pay for, something different. The combination of round cabinet and parlor lamp should, if suitable colors are employed in the lamp shade, prove a very attractive addition to any room.



Circular phonograph combined with parlor lamp

Many Odd Combinations Found

In an attempt to get away from the conventional many manufacturers have included a phonograph in some staple article of furnituer. As usual some have carried this idea too far, so that we sometimes run across a phonograph in the base of a table lamp, or in the case of a grandfather's clock, or again in the case of a combination bookcase and writing desk. The trouble here is that many a person desirous of purchasing an instrument does not need or has not room for such an unwieldy article as a combination book-case and writing desk, or does not fancy a large, unwieldy table lamp.

The library table offers the best solution of a combination instrument. Here again the mistake is often made in not catering to convenience as well as utility. This is noticeable in a combination instrument where the whole table top must be raised to get at the phonograph and records. To do this the whole top of the table must be cleared, something that is not always convenient.

Table With Stationary Top

A phonograph recently put on the American market consists of a very attractive library table 48 in. by 28 in., in some of the popular period designs. The main feature of this is that two-thirds of the top is stationary, the section over the phonograph, alone, moving. Thus it is not necessary to clear the table every time the instrument is played. The records are kept in a cabinet built in one end of the table.

Another departure is a cabinet made entirely of reed and cane. The design is the conventional one. An instrument of this type would have a very limited market. It would be most suitable in homes where the living room is furnished in wicker. The demand for wicker furniture is growing and new lines are being brought out, such as reed bedroom suites, complete living room suites, etc. As the popularity of this furniture increases, the reed phonograph should grow in favor. One thing about such an instrument is that it can be moved about without marring or scratching the finish of the case.

Attractive Twin Floor Lamp

Twin beds are being more and more appreciated, so what is more natural than a twin bed lamp? It consists of the usual form of floor lamp with an attractive double bracket at the top of the standard. This bracket has sufficient spread to enable suitable shades to be hung on either side. The lamp is placed between the two twin beds and sheds a light on each one. It makes a handsome addition to the bedroom.

The combination refrigerator and kitchen cabinet and the combination serving table and tea wagon, called Mandy, were described in recent issues of the 'Canadian Woodworker" so will not be touched on here.

The Chair Industry in a Healthy Condition

The monthly experience chart issued by the National Association of Chair Manufacturers tends to show existing conditions with regard to orders received, shipments made and the value of the unfilled orders of the members. It is based on reports made by thirty-two representative chair manufacturers. The comparative figures given show that in April, 1920, the total number of pieces shipped amounted to 272,165 with a value of $2,400,000. During the same period the orders received totalled $2,750,000 and the unfilled orders amounted to $10,600,000. The figures for the corresponding month in 1919 were: pieces shipped, valued at $1,400,000; orders received, $1,600,000; while the unfilled orders amounted $1,800,000. This indicates a very strong market with the demand exceeding the supply. Production for April, 1920, shows an increase over April, 1919.

And Why Not Use Canadian Woods?

Value and Worth of Native Woods Not Appreciated—Not Given Careful Treatment in Plants—Question of Grade Gives Trouble—Compare Favorably With Any Wood

The slogan of the furniture industry in Canada might well be "More furniture from Canadian woods." The demand today is largely for furniture of walnut, mahogany and oak. This is partly due to the stress that has been laid, by the manufacturer and retailer alike, upon solid walnut, solid mahogany and to the fact that here-to-fore none but the cheaper lines of furniture have been manufactured from local woods.

Mahogany, walnut, oak and gum are fine cabinet woods, there are none better, and they have been given prominence and have gained a reputation through long use. Among our native woods we have some that compare very favorably with any imported species of cabinet wood and which should command a good volume of trade if sold on their merits.

Augurs Well For Furniture Industry

It is said that straws indicate the way the wind is blowing and in the same manner the furniture exhibition recently held at Jamestown, N. Y., may indicate the possible demand for the coming months. A large number of retailers were in attendance and it was quite evident from the orders placed that the American furniture dealers are satisfied that they can rely upon a continuation of the strong demand which exists for furniture.

The show was scheduled to be of two weeks' duration but the available stocks were disposed of during the first four days. After that the manufacturers booked orders for future deliveries at prices prevailing. Many furniture makers accepted sufficient orders to keep their plants going for the next twelve months and it is reported that several booked so many orders that it will be eighteen if not twenty-four months before they are all cleaned up.

The prices ruling did not indicate any weakness in the furniture lines as good figures were quoted on all offerings. As an instance a veneered walnut bedroom suite, of fair quality, was on display. The dresser, a 50 in. one, with a 30 x 40 bevel mirror was quoted at $135.00, the chiffonier $110.00 and the bed $97.00.

The exhibition would seem to indicate that the furniture industry and furniture trade as a whole is in a strong and prosperous condition.

Take birch for instance. Is it really necessary to camouflage this beautiful wood and sell it as imitation mahogany or imitation walnut, relying entirely upon the term walnut or mahogany to make the sale? It is true that the same article would not likely sell as readily if the prospective customer were told that it was made of birch. There is something radically wrong as long as this state of affairs holds true.

Turning to Native Woods

The high values of all lumber, the difficulty of securing adequate stocks and the unprecedented increases that have taken place on certain lines has done much to focus the attention of Canadian wood users on the products of our own forests. This is only a preliminary. The woodworkers must be sold to the value of native timber. Many of these manufacturers have been using local woods for certain lines and in certain places ever since they first engaged in the woodworking business, yet it is doubtful if many of these same gentlemen realize the true value and worth of certain local woods for high class furniture and other fine cabinet work.

There are many reasons that might account for this lack of appreciation on the part of wood users, of the real value of our lumber. One is that all along Canadian woods have been comparatively low priced and in most instances have been considered and treated as so much cheap lumber. While such woods as mahogany, oak and walnut were, on account of their reputation and value, handled with care, dried thoroughly and properly and every effort made in manufacturing and finishing to bring out and enhance the beautiful grain, the home grown product was given scant attention in the yard, in the kiln and when proceeding through the factory. In addition it was usually finished with some muddy stain, which completely hid the fine figure and the beauty of the grain, in an imitation of walnut, or mahogany. Is it any wonder then that Canadian woods are looked upon with scant favor by the manufacturer and with still less by the buying public?

The Question of Grade

Another feature that has mitigated against the use of Canadian woods is the difficulty which has often been experienced in securing suitable grades of stock or stock that is up to grade. This is particularly the case when dealing with the small operator. These men have little or no sales organization and if they attempt to dispose of the different grades separately often find considerable difficulty in finding a market for the lower grades after the best stock has been placed. Thus they are forced for self protection to mix grades to a certain extent and aim at disposing of run of log stock. In addition in many instances their ideas of grading and their knowledge of grading rules are very hazy, so that while they honestly endeavor to ship graded material they fall down in their grading because they do not know what they are doing. The ideas of the lumber checker or inspector, at the factory, are often just as hazy and many a manufacturer who has purchased a certain grade of stock, only to find that it did not work up satisfactorily in the plant, blamed the Canadian product when the real trouble was that he did not reveive the grade he bought, and did not know it. It is estimated that about 75 per cent. of the hardwoods cut in Canada is shipped to the United States markets and that a large proportion of this lumber is used by the American furniture manufacturers. If the American furniture firms can secure suitable graded stock in Canada, it stands to reason that the Canadian manufacturer should be able to secure an adequate supply of first-class material.

The remedy is obvious. First the employment of a thoroughly experienced man as checker or inspector, one who is familiar with all stocks and grades. Second, dealing with reputable firms who have an ex-

tensive sales organization that enables them to find a ready market for all classes of material and are thus in a position to guarantee the grade of all the material shipped. Some of the large operators will accept a contract for a year's supply at a fixed price and guarantee the quality of every piece shipped. The buying of lumber at fixed prices should help stabilize prices in the furniture industry.

Automobile Industry Factor in Market

Another factor that must be reckoned with is the automobile industry. The manufacturers of automobiles have turned their attention to such woods as birch, maple and elm and are buying good grades and paying good prices. They can well afford to do this as formerly they paid fancy prices for the oak and other stock they used. This has helped to force values up and will help to maintain them at present levels. Thus the furniture maker who contemplates using local woods must be prepared to pay the market prices. When one buys below market values the stock is usually just what is paid for and that is cheap stock. It is questionable if the initial saving of a few dollars on the price of lumber will offset the disadvantage and extra cost of working poor material.

There are on the market many transparent stains in all shades, both oil and water, that will bring out the inherent beauty of the grain of local wood. While there is no doubt that popular fancy is at present calling for the darker finishes, such as walnut and mahogany, it is the dark shades that please not the terms walnut and mahogany so why use these names when referring to such a finish on birch or maple. Some attractive names could be used which would convey the shade of the finish without suggesting any other wood.

After the furniture manufacturers have been convinced of the advisability of featuring Canadian woods, the next step would be that of creating the market for it and bringing the discriminative home furnishers into line. As one large manufacturer has aptly put it: "The buying public in Canada may have been in the past prejudiced against birch because it was a cheap wood and used chiefly on low priced lines. We feel that it is absolutely necessary from a standpoint of economy and a sound business policy that we feature this wood in our furniture and we are doing so." This is especially true in view of the high adverse rate of exchange that the Canadian importer is forced to pay. The use of native woods would tend to ameliorate this intolerable state of affairs.

Here is where the Furniture Manufacturers' Association might lend a hand and in this they would assuredly have the support and co-operation of the larger lumber operators. If the newly formed publicity section of this organization did not do anything more than popularize furniture manufactured from Canadian woods it would have justified its existence.

How to Reduce your Lumber Account

Present Conditions Demand Up-to-Date Methods and Equipment—Suggestions That May Help Cut Costs—Room for Improvement in Many Plants

By Furniture Manufacturer

Perhaps never in the history of the woodworking industry in Canada was it so necessary to be up-to-date in equipment and methods of manufacture as at the present time. The abnormally high cost of material, the high cost of labor, coupled with the difficulty of getting the pre-war standard of efficiency from it, make it more than ever necessary to guard against wastage of material or ineffective methods of manufacture

Somewhere I wrote an article on "The Proper Use of the Imagination in Making Furniture," and would now suggest Mr. Manufacturer that you and I use our imagination for a few minutes in considering a few manufacturing questions. With your permission I will take a walk through your factory and yards (in imagination only, of course) and make a few suggestions for improvements. In any case you won't need to follow these suggestions unless you like and the cost will be no more than the trouble of reading this page.

Eliminate Excessive Handling

In the first place then I see that a railway switch comes into your yard and you can unload from the cars onto the piles. Very good. Have you ever considered building one or two spurs of light tracks for your dry-kiln trucks, so that you can unload some of your lumber right off the cars onto the kiln trucks and thus save one handling of part of your lumber?

Now about your kilns. Are you getting satisfaction from that hot blast system of drying lumber? Really that is supposed to be a little out-of-date, and no doubt you are aware that there are many firms—I must not mention names in an article like this—that makes a business of putting in dry kilns of the moist air type, that certainly dry lumber with a minimum of loss, that keep it straighter and more free from case-hardening than can be done with dry air. In addition to this the moist air system dries quicker, and is just as economical, if not more so, to install. But we cannot go into this question fully. Volumes have been written on drying lumber, and we must get on. I must just say, however, that it will pay to be up-to-date in your drying department.

So this is where your lumber comes into the factory and goes to the swing saw. I notice that your men are throwing it off the kiln truck and then have to carry it to the swing-saw pile. Could you not have a turn-table made or a little track on your floor to enable this lumber to be unloaded right at the swing saws? This would save one handling and you can easily figure how much that costs in a year if you know what your output is, as of course you do. A few minutes figuring will tell you whether the outlay for a turntable or track would pay for the initial expense.

Multiple Stops Aid Production

Your swing saw seems a good one and that arrangement of stops for the different lengths of lumber you want to cut is first rate. I notice if you want to cut a piece, say 5 ft. 2 in., the stop is there all ready and the stops for shorter lengths move automatically out of the way, coming back into position immediately the longer board is removed. That is good. Do you

know I saw a factory recently which did not have one of these appliances and the swing-saw man spent about 15 per cent. of his time setting stops? What do you think of that?

I am a little surprised to see that you are still using a couple of hand feed rip-saws. Yes, you may have some work that cannot very well be done on the self-feed, but surely that cannot be enough to warrant using two hand feed saws. Have you ever timed the possible output of the two different machines with a first-class man on each?

Working Lumber to Advantage

By the way, before we leave this department have you ever tried cutting your lumber into standard lengths, according to what the lumber is best adapted for, instead of cutting each board into a piece for some particular article of furniture? For instance, you have a good car which will nearly all cut into long lengths and you take all the tops and long pieces out of it you can, even if it makes more than you need at the moment. Similarly when you have a car of low grade lumber and you cut out all the drawer fronts or short pieces that it will make irrespective of what you need at the time. This complicates matters sometimes, but on the other hand enables you to use a lower grade of stock than you otherwise could, and has been known to reduce a lumber account quite appreciably, which is worth considering now-a-days. You say that this suggestion could not be followed with the line you are making? Well perhaps not, but think it over anyway before you decide, because while it is more bother, of course, and sometimes means more handling, it is a great thing to save 5 per cent. of your lumber account.

Let us walk on to your buzz planers. Why there is a man taking the wind out of some short stock on a handfeed machine. I feel certain that if you will put in a self-feed buzz planer that you will pay for it in 18 months, in a factory of this size in the saving of pay alone, let alone having this man producing a good part of the time on some other machine.

Using the Latest Equipment

Your planers seem to be good. I saw a double surface planer working the other day in a large plant where they had ample power, and lots of the right kind of work for it. They told me it was only suitable for part of the work and would not replace the single surfacer for everything.

That continuous feed glue jointer is a good one and, of course, every one with much glue jointing to do has one now, they could not afford to be without one. As a matter of fact I think I imported the first one brought into this country a good many years ago, and it paid for itself many times over.

That is a useful machine you have over there, a double end tenoner and double cut-off saw, combined. That machine in combination with a hollow chisel mortiser works wonders when it comes to making goods into posts and case rails. It does the work faster, and makes it stronger and better than is possible in any other way. If in the course of my travel I come across any one making case goods in the old fashioned way I am afraid I shall say something rude, and get fired out.

Rotating Clamp Saves Money

Now let us walk over to that man clamping up your joints. I see that he is piling the clamped stock on the floor. Is not this a lot of extra work in the way of walking? Have you never considered using one of those rotating machines for holding clamped up stock while the joints are drying. They certainly save time and time is money. I don't know what the prices are now but would advise you to inquire and figure for yourself what saving you can make.

Next month, if you will permit, I will continue my walk and look at your power plant, cabinet shop, veneer room, finishing room, packing department and shipping room.

Invading Canadian Furniture Field

The Canadian branch of the Langslow-Fowler Co. of Rochester, N.Y., which is being established at Cobourg, Ont., will be known as "Langslow Limited." This firm is incorporating under a Dominion charter with a capital of $300,000., $200,000 of which will be paid up at the time the company begins operation, probably October, 1920.

They plan on erecting a modern, up-to-date plant and the contract has been let for the first unit, which will comprise some 26,000 square feet of floor space, in addition to dry kilns and power plant. The most modern labor-saving woodworking equipment will be installed. The lines to be manufactured include household, school and office furniture and special products of wood and steel. The intention is to cater to both domestic and export trade.

The officials of the company are as follows: S. C. Langslow, president; H. R. Langslow, vice-president and managing director; Paul Knox. treasurer; R. G. Van Doorn, secretary. About one hundred hands will be employed at the start and it is anticipated that this number will be rapidly increased.

The present organization at Rochester is devoted to the manufacture of household and school furniture, and employs about six hundred hands. It is estimated that the Rochester plant will work up 5,000,000 ft. of lumber during 1920 into a product, with an approximate value of $2,000,000.

Good Floor for Woodworking Plants

A writer in an English publication in describing a visit to a large woodworking plant says in part: As I walked down through the centre of that shop my attention was drawn to the floor. Its soft springiness, its cleanliness, its comfortable feel, the sense of surefootedness, the absence of jolt or jar—all were characteristics too pronounced to be lightly disregarded And on inquiring I learned that the floor was laid with rock asphalte . . . . In a moment I realized that I had found my ideal floor for the woodworking industries.

For the benefit of those to whom rock asphalte is an unknown factor in floor-making, it may briefly be stated that it is in substance a mineral, limestone bulking largely in its composition, the remainder consisting practically of a high-grade mineral pitch or bitumen. It may be broken up, melted or cooked, then if spread on any rigid foundation it sets as firm as a rock, but as resilient as rubber. It is applied in a hot, plastic condition, spread on concrete, brickwork or flagged floors with wood trowels. It is absolutely watertight, and it also makes a resilient, wear-resisting, dustless, jointless and noiseless floor surface.

For a floor subjected to hard wear it is applied in a layer about 1 in. in thickness, it will adhere equally as well to wood floors as to concrete or brickwork. Its cost compares most favorably with any floor.

Do Not Object to Long Hours or Overtime

Automatic Humidity Controlling Instruments on the Job 24 Hours Daily—Maintain Drying Conditions within Narrow Limits—Increase Efficiency and Effect Saving in Operation

By A. E. Krick*

The tendency in all lines of practical endeavor is toward automatic machines, automatic control—where men direct and adjust and machines perform and govern. With dry kiln operations being conducted on an ever increasing scale, and with the science of artificial drying of lumber being developed to a fine point, where conditions must be controlled within very narrow limits for the best results, the evolution of automatic temperature and humidity controlling instruments is not only a natural, but a very successful result.

There are many reasons for the greatly increased popularity of dry kilns and for the fact that they are being employed in greater numbers and for a greater variety of operations than ever before. A few might be mentioned, such as the high values of lumber (it costs considerably more nowadays to carry a large stock for air-drying); the scarcity of lumber, which makes it practically impossible to secure seasoned timber, making it necessary to hasten the drying of the material that comes in; a better realization of the real value and economy of this method of seasoning lumber. Many others might be cited, but the fact remains that more material is being artificially dried than ever before.

Kilns Placed On Most Efficient Basis

The effects on lumber of heat, humidity, ventilation and circulation have been studied. Successful drying schedules have been worked out to suit various requirements and different woods. Kiln design and construction have come in for their share of attention, so that today there are many types of kilns being installed which are capable of producing practically perfect results, if properly handled. The weak link in the whole chain of kiln drying development has been (and is) the human factor, i.e., the operator responsible for maintaining ideal drying conditions in the kiln.

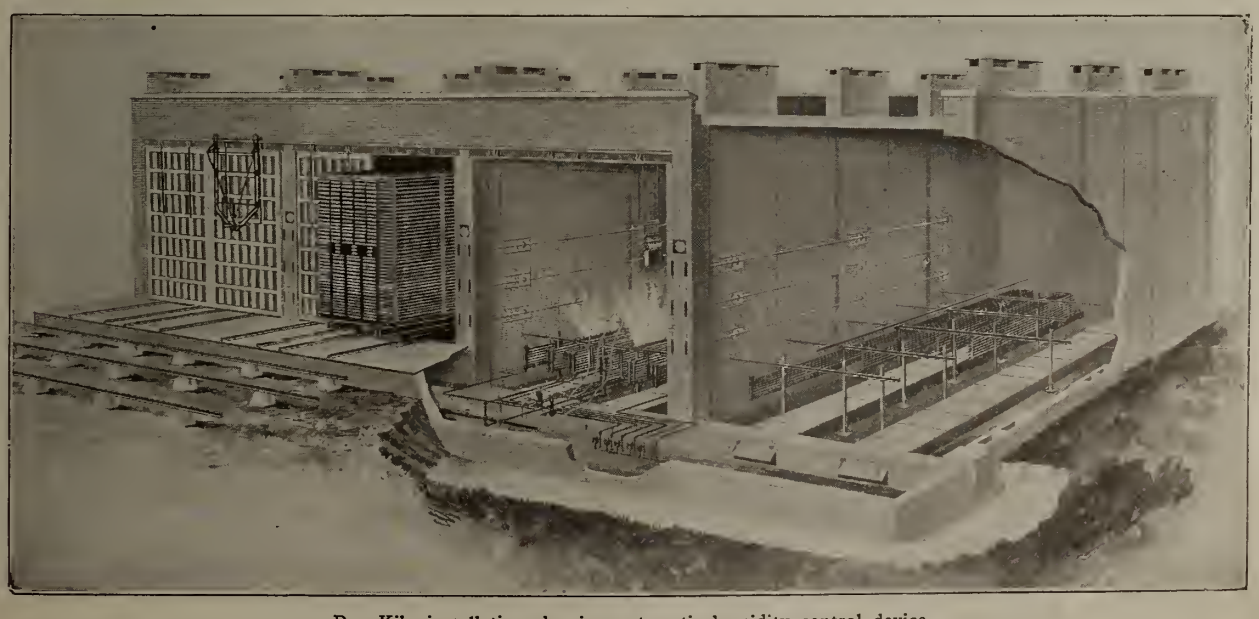
The drying schedules which have been formulated should, for uniform, successful results, be followed within very narrow limits of variation. This demands the maximum of attention on the part of the operator in charge. If one operator has a large number of kilns in his care, it is practically impossible for him to watch conditions, make adjustments, make the tests necessary to ascertain the moisture content of the stock, keep the kiln records and attend to the hundred and one things that need looking after. Even where the number of kilns is limited, there are many things which will affect and change the drying conditions in the kiln, making it extremely difficult, if not impossible, for a man to make all the necessary adjustments or make them fine and accurate enough to secure the very best results.

Automatic Control the Solution

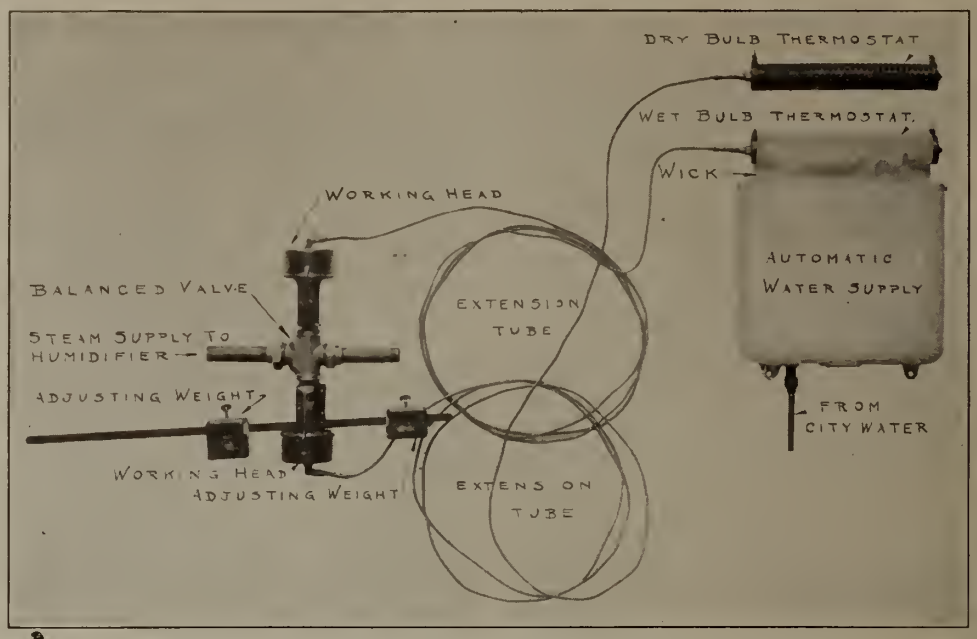
This all leads to automatic controlling devices—devices that will maintain a given temperature and a given humidity under varying conditions, both outside and in the kiln. Thus we have automatic heat regulators that will, by controlling the amount of steam admitted to the kiln, maintain any desired temperature, and automatic humidity controlling instruments that regulate and control the humidity of the air in the kiln.

This latter is a very interesting device. It consists of tested and proven self-contained thermostatic control elements, which work in opposition on a steam valve of the double seated type. The accompanying illustration shows a device of this kind. One of the

*Vice-president of the National Dry Kiln Co., Indianapolis, Ind.



Dry Kiln installation showing automatic humidity control device



Device for automatically controlling humidity in dry kiln

thermostatic control elements, known as the dry bulb thermostat, is affected by the dry bulb temperature of the compartment; the other, the wet bulb thermostat, responds to the wet bulb temperature. By adjusting the weights on the arms, a supply of steam is admitted to the humidifier, proportionate to the relative humidity to be carried. The two thermostats working on the valve will, by working in combination, make any adjustments to the steam valve necessitated by changed conditions, so that the amount of steam admitted to the humidifier is just enough to maintain the desired degree of humidity.

Principle of Control Unit

The principle on which this works may be grasped quite readily, if one were to imagine that the weights and levers were removed. With that done, when heat is turned on, the steam valve will remain wide open, because the pressure on the dry bulb would be greater than that on the wet bulb side. The temperature of the wet bulb is lower, due to the evaporation of the moisture from the silk wick, giving a lower pressure. This condition would hold until the humidity of the kiln reached 100 per cent. or saturation point. When this is reached, the evaporation on the wet bulb ceases and the temperature of the liquid in both thermostats is the same, thus the pressure on the steam valve from both bulbs would be equal and the valve would close, shutting off the source of the humidity.

The weights and levers enable adjustments to be made that will balance the difference in pressure between the two bulbs at any given state of relative humidity before saturation point is reached and thus cause the valve to close and a constant humidity to be maintained.

Proved By Satisfactory Service

The thermostatic elements and the volatile liquid used have been in practical use for the past fifteen years, though their adaptation to the humidity control of dry kilns is a comparatively recent practice. They have, however, been employed in this work for a little over a year. The results achieved and the increased number of installations would seem to indicate that they do the work well and fill a long-felt want. In actual practice some three hundred humidity control values have been in operation over a considerable period, and no trouble has been experienced with any installation.

Automatic humidity control might well be called lumber insurance, as it supplements the work of the operator and guards against costly mistakes being made. Suppose, for instance, in adjusting the ventilation, the operator should open the dampers too wide. Under ordinary conditions, this would lower the relative humidity in the kiln, with a deteriorating effect on the stock. With a humidity controlling instrument installed, the steam valve would automatically be opened and the humidity maintained and controlled under changed conditions. This would also apply should there be any changes in atmospheric conditions.

Perhaps it is not generally known that the ventilation and circulation in any kiln varies and is to a certain extent governed by outside condtions. There is a marked difference in the amount of ventilation which can be secured with given damper openings on a warm summer day and on a cold winter one; likewise between a humid and a dry day. The automatic regulator will compensate for changes of this kind, resulting in even pre-determined drying conditions being maintained, thus contributing to fast and better drying.

Amount of Evaporation Varies

Free moisture makes up a considerable portion of the moisture content of green lumber. This free moisture leaves the stock readily when heat is applied, adding its volume to the relative humidity of the air. Thus, when the heat is first applied to green stock, the same amount of steam is not required to supply the humidifier as would be needed later on. Thus, though the operator may desire the humidity to reach the dew point, a certain proportion of this moisture will come from the stock itself.

This free moisture is soon exhausted, and, unless

automatic control is provided, it falls upon the operator to guard against the consequent drop in humidity and to adjust his humidity controlling valves so as to maintain the humidity as required by the predetermined drying schedule under which he is working. This change may occur at night or when the operator is engaged elsewhere. In any case, it would be extremely difficult for a man to watch each kiln every hour of the day. Should a few hours elapse when wrong conditions obtain, a certain amount of harm would be done and drying operations retarded.

Automatic control, by compensating for all changes at any hour of the night or day, will maintain a kiln at its maximum drying efficiency under varying conditions, according to the predetermined standards, and should result in a decreased percentage of depreciation due to seasoning, and also in a better dried product.

Capable of Giving Good Service

In the past, many automatic devices have been delicate in design and more or less unsuited to the strenuous service encountered in dry kiln practice. The latest models, however, are not at all delicate. In fact, they are of most substantial construction. The thermostats are about seventeen inches long. They are made of heavy bronze metal, with iron protecting casings. The tubes are of copper and are armored with spiral brass flexible protectors. The valves are of brass, equipped with working heads of iron, in which are contained bronze bellows, transmitting the power generated in the thermostats to the valve stem. With this arrangement of parts, the valves can never be partly inefficient. They will either be one hundred per cent. perfect in operation or zero. The presence of a broken or damaged part will be immediately evidenced by the fact that the valve will cease to function.

Acetic and tannic acids do not affect these instruments. The silk wicks remain clean for extraordinarily long periods. On special test, one outfit was checked with calibrated instruments, after one hundred twenty days service, and found accurate.

The cost of these devices is very moderate, considering the great amount of actual service which they render. It has been calculated that the entire cost, allowing a very liberal charge to reserve for replacement, will be less than twenty-five cents per day per kiln. A comparatively small saving in steam, lumber or operator's time will earn a handsome profit on the amount invested.

Many Manufacturers Adopt Electric Drive

Advantages Becoming Widely Recognized—Increases Efficiency of Steam Plant —Individual Motor Drive—Integral Part of Many New Machines

By P. E. Poole

If a prophesy were permissable one would be fairly safe in saying that electricity, in some form or other, would be the motive power of the very near future, and that the individual motor drive will be the type universally adopted. That the economies and conveniences of electric power are being widely recognized is evidenced by the growing number of woodworkers who are making motor installations. Manufacturers of woodworking equipment are also realizing its value and are producing machines specially designed for direct motor connection or in which the motor, or motors, is built in as a integral part of the machine.

Electric power may be utilized in one of three ways; the individual drive where one of a number of motors operate one machine, the group drive in which two or three machines are linked up to one motor or a motor may be used to replace the steam engine distributing the power through the ordinary line and jack shafts. These drives rank in economy and efficiency in the order named. The individual drive being the most desirable for the majority of installations, the group drive next and main line shaft drive taking last place.

Operating Expenses Reduced

The high initial cost of installation has probably deterred firms from adopting the electric drive. When a new plant, or an addition, is being planned the many advantages of electricity should be given careful consideration before a decision is made in favor of any other motive power. Even where current cannot be purchased or where the rates charged are excessice, instances may be cited which prove that a considerable saving may be effected by connecting the steam engine to a generator and distributing the power to motors placed throughout the plant.

A case to point is that of a sash and door factory deriving power from a 100 h.p. engine. The addition of a number of new machines put too heavy a load on the old engine. Plans were made for scrapping the engine and installing a more powerful one. An investigation into the merits of the electric drive showed the folly of this plan. The line shaftings were done away with and a 120 h.p. generator connected to the steam engine. This same engine that had been delegated to the scrap heap generated sufficient current, without being overloaded, to drive motors, the aggregate horsepower of which exceeded 130 h.p.

Independent motor drive on Preston saw

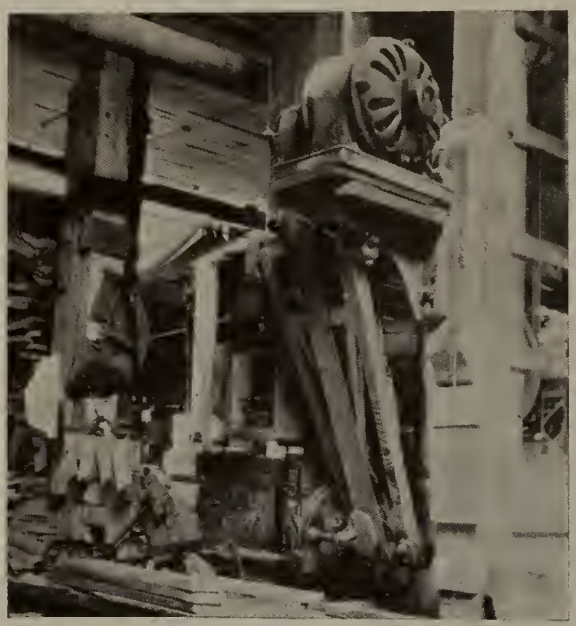
Whether the current is generated or purchased the advantages, economies and convenience of a motor installation are such as to make its adoption highly desirable and a profitable investment. In many in-

stances the outlay is returned in a few years through savings and increased production.

Maintains Production at Maximum

As intimated the individual drive is the most common form of electric installation and is the most economcal and efficient to operate. When one, or a number of motors, are connected to any machine the correct cutting speed of the machine can be maintained irrespective of the total load of the plant. The running of any piece of equipment at its most efficient speed tends for maximum production and a well finished product. The motor may be part of the machine as were the rotar and saw or shaper spindle are one or may be direct connected through a coupling to arbor or shaft, or a belt, chain or gear drive may be employed.

The placing of the equipment irrespective of line shafts is a very desirable feature of the individual drive. Fullest advantage may be taken of the most suitable light. The machine may be placed at any angle for efficient operation or good lighting. In other words the machine may be installed exactly where



Motor installation on E. B. Holmes swing saw in an Orillia plant

required, and where it will fit in to the very best advantage. Thus proper routing of stock may be secured and the work put through with a minimum of transferring and lost motion. Each machine may be run independently and is consuming power only when in operation. In the case of overtime the whole plant need not be operated but just the machine required. The elimination of main drives and line shafts effects a saving in power as well as ensuring that power is not being consumed for idle machinery. Except in the case of a failure of the current or generator, breakdowns are to a large extent localized and do not effect the whole organization.

Applied to Exhaust System

A new application of the individual drive, that is being used in some plants, is in connection with individual shavings exhaust fans for each machine. As most companies selling current base the rate on the maximum demand, if the fifteen or twenty horse power required to drive the fan can be reduced it will have a beneficial effect on the rate charged. Each machine is provided with individual exhaust fan, with individual motor drive, which is piped separately to the roof where it discharges into a cyclone. One is provided for sawdust and another for shavings. Thus the refuse can be sold separately and a much better price realized for the sawdust than if it had been mixed with the shavings. Each fan runs only when required so a considerable saving in power is effected.

In the group drive a number of machines that are seldom operated are driven by one motor. If in a group of five machines which require five h.p. each, only one machine is likely to be operated at a time, a five h.p. motor may be used for the group. If there is a possibility that at times all the group may be in operation at once instead of using a 25 h.p. motor a 15 h.p. installation should give satisfactory service. A good reliable make of motor will carry an overload of 50 per cent. for short periods without injury. It is extremely unlikely that even with the five machines in operation the peak of the load or maximum power requirement will come at one time, or be continuous, thus a lighter motor will do the work, effecting an economy in installation.

Three Phase Suitable Type

This brings up the question of the most suitable type of motor. Many manufacturers have become prejudiced against the electric drive through installing a wrong type of motor, or one that was too large or too small. Alternating or the multi-phase type motors, usually 3 phase, are probably the most suitable for woodworking service. They are simple, having no brush or moving contacts, light in weight, have a constant speed and will carry an overload for short periods without damage. It is a good policy to purchase only motors manufactured by firms of well known reputation and standing.

Many other advantages might be cited and no doubt a number of these have occurred to the reader. One worthy of mention is the saving affected through a reduction in insurance rates. This is more pronounced when the individual drive is employed.

Referring to equipment with built-in motors there are now on the market, moulders with a separate motor connected to each head and one for the feed works, shapers and saws where the spindles and motor rotors are one. One of the newer machines of this type, is a swing cut off saw with the motor mounted on the lower end of the arm, the saw being attached to the end of the motor shaft. A special compact motor, having a small diameter, is used. The May "Canadian Woodworker" contained descriptions of a motor driven double end tenoner and a motor driven saw tenoner.

Advantages of Combination Doors

R. Laidlaw Lumber Co., of Sarnia, are featuring at the present time their combination door which may be changed from a storm door to a screen door in five minutes and vice versa. Certain standard sizes are carried in stock.

In addition to featuring this combination door and combination storm and screen window and pointing out that these conveniences save fuel, the R. Laidlaw Company have issued a neat illustrated leaflet, stating that houses with storm windows and storm doors require from one-third to one-half less coal than the ordinary kind, and in these days the saving of fuel is a big consideration.

Production System for Woodworking Plant

Efficient System Essential for High Production—Has Marked Effect on Overhead —Distribution of Authority—Importance of Equipment Suitably Arranged

By L. F. Simpson*

Manufacturers in all spheres of industrial endeavor are striving to increase their output and produce more and more of their products. This is partly an effort for greater efficiency and reduced manufacturing costs and partly an effort to satisfy the world-wide demand which exists for all commodities in everyday use. One reason for this shortage is the fact that during the war a large number of firms devoted their entire organization to the production of munitions of all kinds and in this work many manufacturers gained invaluable experience, learned new wrinkles and new methods that are of untold assistance in turning out more and better work in the manufacture of peacetime requirements.

Among the various industries of Canada the metal-working, the wood-working, the textile industry and numerous others we find that the wood-working plants and mills are keeping well to the fore in their production. Lumber of all kinds is used so extensively in so many lines that large engineering staffs are being employed by the manufacturers of wood-working machinery in an endeavor to produce new devices and new machines that will enable the woodworker to eliminate operations here and there and to cut down the time required in the production of certain articles; in other words, their efforts are devoted to producing equipment that will enable the manufacturers to increase production, thus saving time, expense and tending to prevent manufacturing costs from reaching higher levels.

While all manufacturers are endeavoring to operate their plants as efficiently as possible and to increase production, so as to keep down their overhead expenditures and maintain deliveries, this article may be of interest in that there may be a point or two that will assist in working out some detail that is causing overhead expenditures to be abnormally high. We all know that there are many factors that cause the fluctuations in overhead charges but there is one item that causes the overhead to vary probably more than any other and that is production.

Has Direct Bearing On Overhead

Two facts are well known by all engaged in manufacturing. One is that increased production means a lowering of overhead expenditures and the other that decreased production means a higher fixed overhead expense. It is hardly necessary to emphasize the importance of that word "production" because we are all so familiar with the advantages of producing two or more of any article, chairs, tables or any piece of work on which time is expended, in the same space of time that was formerly required in turning out one article.

A detailed description of a production system that would be applicable to any woodworking plant is too great an undertaking to attempt in an article of this length. The different lines and different styles of the various manufacturers are so entirely diverse, the equipment and conditions so varied that a system worked out for one factory would prove unsatisfactory in another. Having this in view, the following description of a production system and production methods is written with the idea of giving suggestions that may be of value to those engaged in woodworking.

*General Machinery Company, Toronto.

Divisions of Production System

Let us state briefly the different items, in the order of their importance, that would have a direct bearing on any production system in a wood-working plant making, say, cabinets for phonographs; supervision, labor, equipment, arrangement of equipment, materials, method of operation, records of work in process, trucking and inspection, taking the different items in order, a few words by way of enlargement may prove of value.

Supervision may be graphically and more forcibly

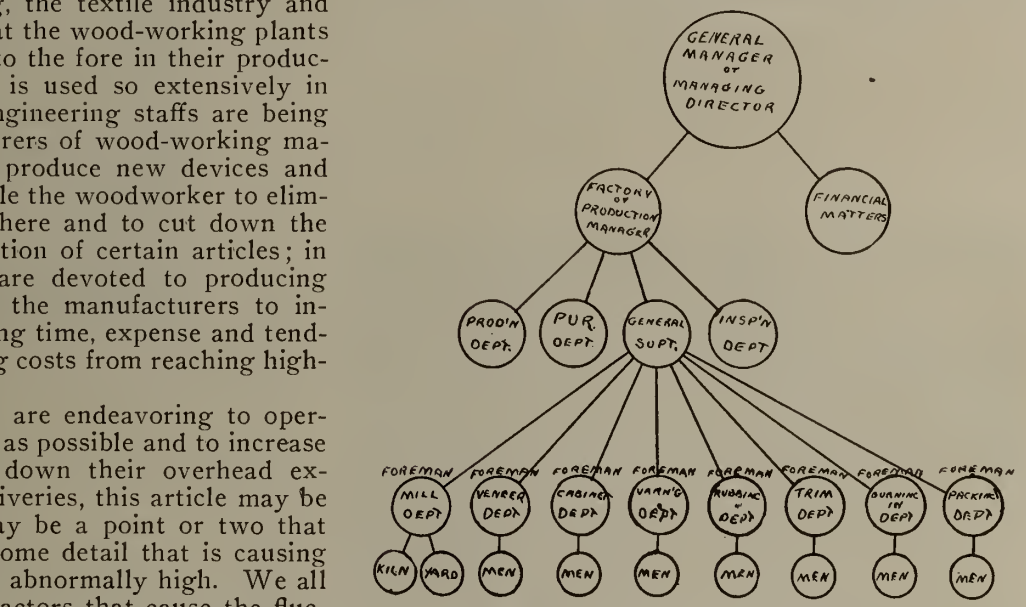


Chart defining division of supervision and authority

shown by the accompanying chart. It will be noted from this chart that the supervision is clearly defined and outlined where information or authority is required. Any disputes or uncertainty that may arise on any phase of supervision can be cleared up by referring to a chart of this kind. Each department foreman is responsible to one head, viz., the superintendent. The superintendent is in turn responsible to the factory manager, and so on as the lines of the chart connect one authority to the other, so it can be worked out in actual practice.

Labor is given second place because of its importance. For instance, in the event of a strike a lot of time is lost, the plant may have to be closed down, therefore, production has ceased. Many machines have been invented to augment the supply of labor but it is impossible to run machines without men to guide and control them. Labor is required in the assembling of the cabinets, the finishing of the product; in fact it is one item essential to production in any manufacturing plant and satisfied employees aid immensely in maintaining production at this maximum.

Equipment is the next item to be considered. A plant may have almost any quantity of machinery and

equipment but if this is composed of machines that are antiquated, out of date or worn out, it is far better, as we all know, to scrap this equipment and let their scrap value go into the cost of probably half the number of modern, up-to-date, labor-saving machines, than to struggle on, trying to get good results without adequate facilities. In purchasing new machinery, great care should be exercised so that one may be certain that the equipment in question will actually do the work for which it is secured. Cases are occurring every day where plants are buying machinery that is not suited and in some cases not intended to do the operations expected of it.

All equipment should be substantial in every respect and purchased in a common-sense way, always keeping in mind the practical point of view, as delays or break-downs or experimenting cause a drop in production in any plant. Another point to bear in mind is that the addition of some particular machine may result in reducing labor one half on some one operation; for instance, let us take a plant that is turning out panels for cabinets. In trimming the four sides of these panels on an ordinary trim saw, four individual operaters are required. If a double trim saw were installed, the operations would be cut down to two. Thus the work would be done in half the time, making it easier for the men on that operation and securing just twice the production. This is only one of the many instances where a saving may be effected through the installation of new equipment.

There are many small spare parts required in connection with the equipment of a plant that should be kept in the stock room at all times. Some individual should be made responsible for these parts and it would fall on him to see that these items are in stock at all times so that when a machine breaks down it is not necessary for a number of men to be idle while a message is sent to the supply house for some particular part of while relying on the delivery service of the supply man. Equipment properly cared for will give many years of extra service.

The equipment in any plant can be arranged in two ways. In the first it may be installed without due regard for the work going through and a proper sequence of operations. Thus the machines would be placed anywhere where they would be handy to the shafting. If the other method were followed, due consideration would be given to the various machines on which certain operations are to be performed and these machines arranged so that they will be convenient for the next operation or concentrated in batteries, in as small a space as possible, for completing the operations on certain individual parts. Care must be taken not to go to the other extreme and crowd the machines in groups.

An efficient arrangement of equipment will save labor in handling or trucking and will tend to enable each machine to be operated at maximum capacity. In some plants one will find a piece of equipment installed at one end of the factory and the next operation will have to be performed on a machine that is placed away off at the other end of the building. The workmen consequently spend a large part of their time trucking the material to and from the different machines and at the same time, in nine cases out of ten, they disturb other laborers and time is lost on other operations and the efficiency of part of the plant reduced. The arrangement of equipment can save considerable in operating costs and can be a big aid in boosting production.

(Continued in July issue)

Chair Manufacturers Seek to Stabilize Prices

The Second Quarterly meeting of the National Association of Chair Manufacturers in Chicago on May 19th was attended by representatives of fifty chair factories.

The reports of existing conditions and the opinions as to the immediate future showed that all factories are considerably behind in filling their orders. The factories have felt the transportation difficulties of the past sixty days.

A canvass as to policies now in force showed that with few exceptions the factories are selling at price prevailing at time of shipment and have no alternative until their experience shows that the market for supplies required and labor conditions have reached a point of stabilization which will permit the factories to guarantee their prices for a period of time. There is no desire to inflate selling prices anticipating possible increases in cost in order to give a guaranteed price. The chair manufacturers are today operating with a knowledge of costs due to improved accounting methods which enables them to analyze their own conditions in a manner far different than was the case a few years ago.

This meeting, like all similar gatherings of manufacturers these days, spent considerable time in an earnest endeavor to analyze conditions in order that the industry can operate with as little apprehension regarding the future as possible.

It is the desire of every chair manufacturer to so operate his business that he can give the maximum amount of service to his trade. He feels that the moment production conditions enable the factories to discontinue the practice of selling at price prevailing at time of shipment, the sooner general satisfaction will be established for both manufacturer and retailer.

Not content with merely accepting a situation which exists and "passing the buck" to the other fellow, the meeting passed a resolution asking the National Council of Furniture Associations to immediately get in touch with industries supplying materials to the furniture manufacturers seeking to secure a basis of stabilization which will junction with the retail dealers. This is a phase of activity in which the producer and distributor of chairs can meet on common ground and further their respective interests to their everlasting benefit.

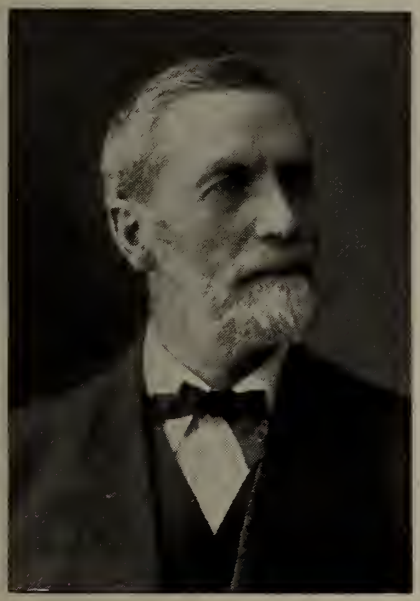
Rhodes Curry Co., Limited, Reorganize

A business reorganization that is of importance in Nova Scotia, and not without interest in other parts of Canada, is that of the Rhodes, Curry Company, Limited, which now becomes simply Rhodes, Curry, Limited, divorced entirely from the Canada Car & Foundry Company, of which for some years it has been a subsidiary. It is understood that the latter company was not unwilling to cut away from everything except the making of cars and therefore it was convenient to allow the works at Amherst to be disassociated from the enterprise which has its headquarters at Montreal. The operations of Rhodes, Curry Company will be completely centralized in Amherst and branches which have been established at other points, it is understood, will be closed. This means the perpetuation of what has become one of the oldest of the industries of Nova Scotia.

Specializing in High Grade Wood Products

Large, Well Equipped Plant at Orillia Turns Out Variety of Lines—Steam and Electric Drive Used—Manufacturing All Done on One Floor

There are not many engaged in wood-working who have not heard of J. R. Eaton & Sons, Limited, of Orillia, Ont. This old, well established business was founded in 1885 by J. R. Eaton. Later on one of his sons was admitted to partnership and the name changed to J. R. Eaton & Son. In 1910 a second son was taken into the firm and a joint stock company formed under the name of J. R. Eaton & Sons, Limited.



J. R. Eaton, founder of J. R. Eaton & Sons, Limited, Orillia, Ont.

A serious setback was suffered in 1910, when the plant was completely destroyed by fire. Nothing daunted, a new and larger establishment was planned, took shape and, in 1914, the present plant was completed. This consists of three buildings—a main factory, 304 by 151, a substantial warehouse and a dry kiln and dry storage shed. The construction is practically fire proof, being of red tile, with concrete floors and slow burning roof. The main factory is one story with the exception of a narrow second floor across the front. The greater part of the second story is used for finishing, the remainder being fitted up as a draughting room. An elevator was installed lately to aid in moving the stock to be finished.

Was Engaged in Munition Work

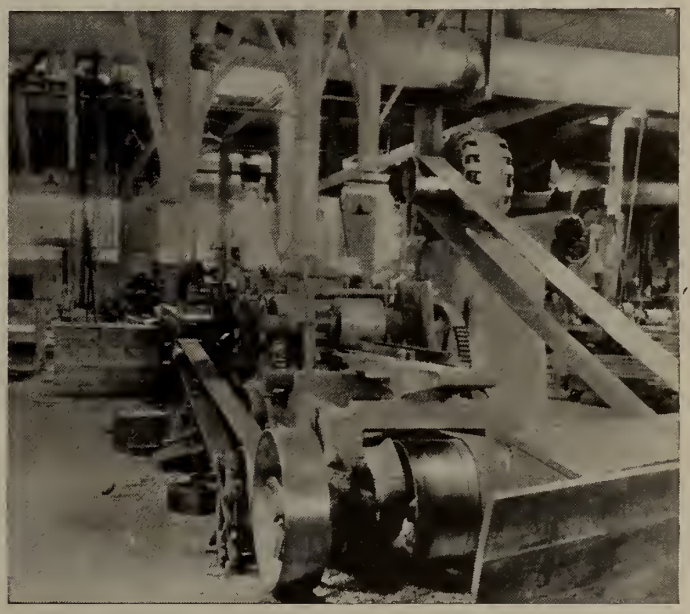
During the recent struggle this firm aided in augmenting the supply of munitions by turning out a large quantity of shells and shell boxes. One side of the factory was equipped with lathes, drills and other machinery necessary for the quantity production of heavy shells. At the same time the woodworking end of the plant was devoted largely to making shell boxes. This iron working equipment has all been removed and the output of the plant is now centered on woodworking lines.

Both electric and steam power is used. The main lines of shafting are equipped with S. K. F. ball bearing hangers. While this installation enables the fullest advantage to be taken of all the power developed, it was found that the 225 H. P. delivered by the steam engine was not sufficient to drive the whole plant. Instead of increasing the steam plant resort was made to the electric drive. In addition to supplementing the steam power, the use of motors has been found extremely advantageous in enabling equipment to be placed in positions where it works to the very best advantage and where it would be difficult to connect up with the line shafting.

An efficient shavings exhaust system carries the shavings and sawdust to a large tile bin situated above the boilers. This refuse is fed to the fires by chain conveyors. Usually sufficient waste is made to keep the fires going steadily and part of the time there is a surplus to be sold or otherwise disposed of.

Well Provided with Trackage

The plant is well situated, there being plenty of room for all future expansion. Excellent trackage facilities are provided by two sidings which run along each side of the factory, giving connections with the C.P.R., G.T.R., and C.N.R. Naturally with such facilities for handling material a large amount of milling in transit is done.



American hardwood flooring machine. Note motor installation

When munition making ceased and the plant was re-organized it was decided to manufacture a line of furniture. This line consists of oak extension tables with square, octagon and round pedestals, five-leg extension tables, oak library tables, kitchen tables and kitchen cabinets. The furniture met with a good demand form the start, some of the tables going overseas. This department has a capacity of two cars of tables a week. A strong effort will be made in the near future to secure a large volume of business from Great Britain and other importing countries.

The other products of this firm include general

mill work, building material, special order work, such as oak paneling, oak cases and all forms of odd work, wood turnings, table legs. dowels, hardwood flooring, sash, solid pine and veneer doors.

Grand Rapids Kiln Installed

The dry kiln is modern and up-to-date and consists of an eight-compartment Grand Rapids vapor kiln. The kiln and dry lumber storage are in the same building, which is of tile construction. Two tracks facilitate the moving of the stock from this building into the factory.

The material for the hardwood flooring is taken in at entrance No. 3. The stock is ripped on a gang edge, 3, which cuts two or three lengths at a time. A Yates power feed band rip saw, No. 281, has been purchased and will be installed in the place of this gang edger. The narrow kerf of the band re-saw will mean quite a saving in the stock being ripped.

The sticking is done on two American hardwood flooring machines. These are driven by individual electric motors. The accompanying illustration shows a motor installation and one machine. The trim saws and C. M. C. and matchers are placed directly behind the flooring machines. If thin flooring is being run the stock is trucked from the gang rip to a Yates re-saw and from there to the moulders. The concrete floor which is kept scrupulously clean, enables the loaded trucks to be moved easily from one part of the floor to another.

Live Rolls Aid Transit Work

The moulders marked 1, 9 and 11 are used for detail and transit work. When the latter is going through, long troughs or chutes are used to carry the material to the car being loaded. Owing to the re-saw working in toward the centre of the factory this method could not be followed. To overcome this a pair of live rolls, 8, were installed to push the stock along a chute, out to the waiting car.

A few Yates machines installed in the J. R. Eaton factory

The stock for the furniture and special order work comes in through entrance No. 4. This brings it in line with the swing cut off saws. These saws are motor driven. In the case of the two E. B. Holmes saws, the motors are mounted on the upper part of the iron frame. The lighter equipment in the front

half of the building is used for furniture, door and sash-making and detail work of all kinds.

The veneering and gluing-up is all done in the glue room. Here none but animal glue is used. A glue spreader has been installed to take care of the veneer work. Plenty of room has been alotted to this department, so that a large amount of work can be put through without any serious congestion.

The machine shop is well equipped to take care of all the repairs required throughout the plant. In addition special machines or attachments may be worked out to aid in increasing production or for special forms of work. With a suitable iron working shop in the building repairs are effected with a minimum of lost time.

Another feature that might be mentioned is the lighting of the building. One would think that the equipment installed in the centre of such a large floor space might not receive sufficient light. Such is not the case. The side and front walls are nearly all glass and, in addition, four or five rows of large sky-lights distribute a bountiful supply of light to all parts of the floor. These skylights are provided with large ventilations which help to make the factory a pleasant place to work in.

The personnel of the company is as follows: J. R. Eaton, president; E. R. Eaton, 1st vice-president and managing director; J. H. Eaton, 2nd vice president; W. M. Tupling, secretary-treasurer, and W. A. Gray, superintendent.

Working Stock to the Best Advantage

Cutting Material for Thin Edge Mouldings on Bevel Effects Worth-while Saving—Set Edge of Rolls to Bear Near Centre of Bevel Face

By H. H. Ralphe

The present high values of lumber make it imperative that every effort be made to utilize every inch of stock that enters a plant. Recent issues of the "Canadian Woodworker" have contained articles on "The Running of Mouldings in Multiple." This is one method of economizing on stock as well as increasing the output of the sticker, but it has only a limited application and does not enable the fullest advantage to be taken of the lumber going through.

Another suggestion along this line is that mouldings that are thinner on one edge than on the other be made from bevelled stock. This applies to such forms of moulding as picture moulding, drip caps, certain forms of aprons and moulded sills and other lines of a like nature. Suppose we are about to run a large thin edge mould that will require a piece of stock 3 in. x 5 in. if worked from the square. Making the same design from bevelled stock, we can get two lengths from 3 x 8 material. One length from 3 x 5 or 15 square inches and two lengths from 3 x 8 or 24 square inches, shows a gain of 3 square inches in favor of the bevel cut stock.

Judging Value of Different Sized Stock

Before deciding which course to follow, there is another point to consider. Perhaps by bevelling the 3 x 5 material, the piece cut off will have an area greater than 3 square inches and will make a moulding that would find a ready sale. If that is so, it is clearly the better scheme to use 3 x 5 stock. If the piece saved is so small as to be practically useless, the 3 x 8 stock will give better results. Then again, it might be possible to rip to width the bevelled pieces made from the 3 x 8 and secure a narrow bevelled piece from the thin edge that would run some small moulding.

This leads to the suggestion of getting the bevelled pieces from, say, 4 x 5 material and eliminating the narrow piece that may be wasted when 3 x 8 stock is bevelled. Unless this small piece will work into some moulding that will return the cost of material plus the cost of ripping, plus the cost of running, the working up of 4 x 5 stock offers the best method of running the moulding in question, using the smallest possible quantity of lumber.

It will be seen that each individual thin edge moulding must be studied as a separate problem and worked out to the best possible advantage. Like many other ideas. this suggestion has its limitations, where the advantages gained are offset by high labor or manufacturing costs or where the stock saved cannot be utilized or disposed of to advantage.

In running bevelled material through a sticker, it is advisable to grind the sharp corners off the inside of the top feed rolls so that this sharp edge will not cut deep enough to mar the face of the finished moulding. The rolls are then set out as far as thought desirable or as far as the adjusting screw will permit. The idea is to have the inside edge of the top rolls as near the centre of the bevelled piece as possible. When adjusting these rolls, the edge should be set to bear where the cut is heaviest. If this is not done, it is possible that the marks of the rolls will show on some of the finished faces.

Who Put the Cost of Living Into 'High?'

1. 100 men live on an island; 25 fish; 25 clean fish; 25 cook fish; 25 hunt fruit.
2. Everybody working; plenty; everybody happy.
3. 10 fishers stop work.
   10 more try and hide part of their catch and quit.
   5 continuing fishing on shorter hours.
   Fewer fish in the kitchen.
4. 100 men yell for fish.
   50 cleaners and cooks yell for work.
   25 hunters demand bigger share of the few fish.
5. 100 men insist upon "the right to eat."
   25 hunters insist upon "the right to strike," and
   20 strike.
6. Food supply shrinks daily; the man with 2 fish demands 3 bananas for each fish.
7. Man with 2 bananas demands 3 fish for each banana.
   The 10 men at work quit in disgust.
8. Everybody keeps on eating; the hidden fish are discovered and consumed.
9. No food: everybody blaming everybody else.
   What are you going to do about it?
10. Why not try work? You can't eat, buy, sell, steal, give away, hoard, wear or gamble with what isn't!

Do You Guess at Your Cost Figures?

Divisions of Overhead and Where Chargeable—Methods of Applying Various Burdens—Accurate Costs Mean Intelligent Competition and Elimination of Price Slashing

By S. J. Sutherland

(Last instalment of series)

The following paragraphs will be perhaps uninteresting to those who are familiar with the methods of the Millwork Cost Information Bureau, as the writer is using their standard division of expense, and then suggesting the further refinements which are desirable and in some cases necessary to meet the varied conditions encountered in larger factories. They recommend only the standard division of expense. You, yourself, will have to determine the desirability of still further divisions. The small shop, who merely adopts the standard division, will be on a fair basis of comparison with the large factory which uses different burdens for the various classes of product.

There are two classes of material: direct material that can be charged direct to the individual order, such as lumber, glass, etc. Indirect material is all other material, such as nails, glue, screws, sandpaper, etc. There are two classes of labor: direct labor, that which can be charged direct to each individual job, and which should be separated as to machine and bench. Indirect labor, such as oilers, foreman, office staff and other unproductive labor.

Divisions of Overhead

Material burden (overhead) is all indirect labor, indirect material and expense that the material uses up to the time it is sold or is in process of manufacture. Machine burden (overhead) is all indirect labor—indirect material and expense that the machinery operator uses. Bench burden (overhead) is all indirect labor, material and expense that the bench operator uses. Commercial burden (overhead) is all expense of every nature not already charged to the above three burdens, and should include delivery or shipping charges.

Direct material, plus material burden, direct machine labor and direct bench labor, and any other labor charged directly to the individual job, makes prime cost. Prime cost, plus machine burden and bench burden makes factory cost, factory cost plus commercial burden makes total cost.

Note:—Material burden (lumber) includes the following. All labor in yard and kiln ,and liability insurance for same, interest, taxes, and insurance on value of average stock carried, interest and taxes on ground occupied by yard, sheds and kiln. Interest, taxes, insurance and depreciation on shed, kiln and equipment. Maintenance and repairs on shed, kiln and equipment, such parts of power plant properly chargeable to kiln. Such parts of barn expense and motors used in hauling lumber. Such part of office expense used in purchasing lumber. Lumber burden divided by the number of feet of lumber handled equals the average amount per thousand to add to lumber.

Machine (burden) includes such part of power plant expense properly chargeable to machinery, carrying charges on machine investment, indirect machine labor, maintenance and repairs on machine and depreciation. This is the cost per hour of running each machine (not including wages paid machine man) depreciation of machinery is included at 10 per cent.

Many cost systems direct material and direct labor to the individual job and distribute all the balance of cost (burden or overhead) equally to all classes of product. There are four methods commonly used.

The First Method

Burden equals 200 per cent. of direct labor.

Sample 1. 1000 feet run moulding.

Direct material Y Pine	$15.00
Direct labor	3.00
Burden at 200 per cent. of labor	6.00
Cost	$24.00

Sample 2. 1 book case pedestal.

Direct material	$ 1.00
Direct labor	4.00
Burden at 200 per cent. labor	8.00
Cost	$13.00

The above shows that the burden on an article with $1.00 worth material is more than 1000 ft. moulding used $15.00 of material. In case mahogany was used at over five times the cost, the burden would still be only $6.00.

The Second Method

Burden equals 50 per cent. of material used.

Example 1. 1000 feet run moulding.

Direct material Y Pine	$15.00
Direct labor	3.00
Burden at 50 per cent. of material	7.50
Cost	$25.50

Example 2. I Book case pedestal.

Direct material	$ 1.00
Direct labor	4.00
Burden at 50 per cent. material	.50
Cost	$ 5.50

By this method, if the moulding had been mahogany, the material worth $75.00 ,the burden would be $37.50 as against $7.50. The pedestal is ridiculously low, which is not an extreme case in cabinet work.

The Third and Fourth Methods

Burden equals $50.00 per M of material used. By this method moulding and all machine work would be high and all cabinet work low.

Burden equals 40 per cent. of direct material and direct labor.

Example 1. 1000 feet run moulding.

Direct material Y Pine	$15.00
Direct labor	3.00
Total	18.00
Burden at 40 per cent. of total	7.20
Cost	$25.20

Example 2. 1 book case pedestal.

Direct material	$ 1.00
Direct labor	4.00
Total	5.00
Burden at 40 per cent. of material and labor	2.00
Cost	$ 7.00

Again, if the moulding were mahogany, at a value

of $75.00 and the burden 40 per cent. of $78.00 equal $31.20 or $24.00 more than yellow pine This method also leaves cabinet work too cheap. Applying the method of adding the burden as worked out as chart shown in previous article. (Rates used will ,of course, vary).

The Fifth and Best Way

Example 1. 1000 feet run moulding.

Direct material Y Pine	$15.00
Lumber burden at $4.50 per M feet	1.50
Direct machine labor	3.00
Machine burden at 35c per hour	3.30
Factory cost	22.80
Commercial burden at 20 per cent. of factory cost	4.56
Total cost	$27.36

Example 2 1 book case pedestal.

Direct material (oak)	$ 1.00
Lumber burden at $6.00 per M	.10
Direct labor (machine)	1.00
Machine burden at 35c per hour	1.10
Direct bench labor	3.00
Bench burden at 20c per hour	2.00
Factory cost	8.20
Commercial burden at 20 per cent of factory cost	1.64
Total cost	$ 9.84

By comparing the first four methods with the fifth you will see that they are placing the burdens or overhead exactly where it should be and in this way cabinet work will carry its proper share (and practically all cabinet work is always figured low).

Advantage of Accurate Costs

It is the aim of every merchant and manufacturer to dispose of his goods at a price which will return to him first the cost of the article, including his expense of doing business, and, secondly, such a profit over and above the cost as will return to him a fair return on the capital invested. Therefore, in fixing prices he starts, as a rule, with what he considers cost. The difficulty arises when his information regarding costs is inaccurate or misleading. In his effort to develop his business he undersells his competitors, and when these prices are met, he shades them again, not knowing exactly when the point of danger is reached or passed. And so, as competition increases and prices are reduced, the weaker operators perforce drop out. The demand presently exceeds the supply, the prices rise, thus rewarding with generous profts, those who survive. This new condition attracts new enterprises. The supply increases and the prices fall again. The result is that in many industries extraordinarily prosperous periods alternate with exceptionally lean periods. These alternate periods of prosperity and depression are due partly, no doubt, to causes beyond the control of that particular industry, but it must be admitted that they are caused largely by faults and mistakes within the industry itself.

It is a remarkable fact that only relatively few enterprises become financially successful, and still fewer remain prosperous over long periods. Only occasionally is a business house encountered which has a history extending back over a generation, although there is no inherent reason why a business once established should not go on indefinitely.

A business may show a profit as a whole and yet it may not necessarily follow that profits have been earned on each item of merchandise, for losses on one class of goods may be than offset by profits on other classes. The result of such a condition can only mean, in the long run, the loss of the profitable business to competitors, and the retention of the unprofitable business which no one else wants

No manufacturer knowingly sells an article below its actual cost, unless very exceptional circumstances. It follows, therefore, that cutting of prices, resulting in keen competition, is generally the direct result of erroneous cost figures.

Although business men may be in sharp competition with each other, they have in fact a very well-defined community of interest. The unsound and uneconomic practices of an operation affects directly or indirectly every other operator in the same line. An enlightened self-interest, therefore, demands every effort on the part of all to prevent each individual from creating disturbed business conditions. No other one thing will so help to stabilize trade as full knowledge on the part of all as to the real cost of production and distribution.

Clean competition should centre around quality and service rather than price. It needs no salesman to secure orders at cut prices. The variation in the market prices of articles of the same kind will tend to become of decreasing importance with the spread of more accurate cost accounts. When a materially lower price does appear it will be the direct consequence of more efficient operation, and it would be only fair that the efficient operator should reap the benefit of his enterprise. Efficient operation and the elimination of waste are themselves among the most important objects to be achieved with the aid of accurate cost accounts.

Keeping Moulding Knives in Shape

By M. N. W.

The heavy wear on different parts of a moulding knife, such as the outside cutting edge of a knife making a side cut, necessitates an excessive amount of grinding to keep the cutter in its original shape and to maintain the size and contour of the moulding being run. This is more noticeable, perhaps, when running stock like half rounds where both the inside edges of the curved knife wear much more rapidly than the centre. Thus, the distance between the two cutting edges at the end of the knife increases rapidly and the moulding becomes broader and more squatty. To overcome this it is necessary to grind the centre back sufficiently far to maintain the original shape of the cutter. This requires a considerable amount of time and at best offers only a temporary relief, for it does not take long for the edges making the side cuts to wear away again.

When running half round, the writer overcame this feature by using four knives on the top head, using the top head saves the bother of holding the work accurately over the cutters on the bottom head. When first set up, the four knives are ground the exact shape required by the pieces being run and are set so that all four are cutting. When the sides wear back and grinding is required, two of the knives are ground on the right-hand side and the other two on the left-hand edge. When setting them back on the head, they are staggered slightly so that two of the knives cut in one side and two on the other. while the whole four cut on the top. In this way the shape of a half round can be maintained with a minimum of grinding. In addition, the life of the cutter is extended considerably as the material is not ground away so rapidly. With steel commanding such a high figure, this latter feature is of considerable importance.

Utilize Everything But the Buzz

Stream of Dollars Maintains Refuse Heap—Market for Small Blocks—New Lines to Help Eliminate Waste—Shavings and Sawdust Difficult Problem

By Harold Sutton

If any manufacturer who works up large quantities of small pieces of wood will write the "Canadian Woodworker" giving particulars and sizes of the material used, it is just possible that a source, or sources, of supply may be found that will result in this material being secured, cut to size, at a figure that will result in reduced manufacturing costs. At the same time one of the most important resources of the Dominion—lumber—will be conserved.

A problem that is engaging the attention of many woodworkers is the economical utilization of factory waste—the edgings, blocks and shavings that accumulate around the plant. Some day some person will devise a simple, inexpensive method of producing wood alcohol, charcoal or similar product from this material and thus enable it to be worked to advantage. Until that time comes, and let us hope it will be soon, the question of realizing a profit, or even a return, from material that is now going to waste, is largely a matter of individual initiative. It is a case of seeking and working up a market rather than expecting the market to come to the plant.

In a description of a large ready-cut house concern, which appeared in an American publication, reference was made to the way this firm disposed of the immense quantity of short ends and block that would accumulate each day. These people did not confine their attention to the locality surrounding their plant, but made a careful survey of the available market for small blocks which might exist in the surrounding states. The result was that one firm was found that could use two cars of 8 x 8 x 1 clear blocks per month, another was found that used large quantities of 3 x 6 x 1 and a third was found that would purchase smaller blocks in carload lots. With this market within reach it was a simple matter to have the edgings and block drop on conveyors, which carried them to sorting tables. Here the material that could be utilized was picked out and sent to gang equalizers that soon brought the blocks to the required sizes. The prices realized turned what would have been a loss into a small profit and helped swell the earnings of the whole plant.

Every Bit of Waste Utilized

In another large plant nothing is burned except for generating heat and power for the plant. Not even stove wood for the employees is available. Pieces as small as ⅜ in. by 1¼ in. by 8 in. are worked up. These are made into small trays and disposed of to smelters and founders who use them when sorting small pieces of metal. The metal is piled on the trays and the whole placed in the furnace. The trays are consumed after contributing to high efficiency in handling. Chemical companies use similar trays and in the same manner.

Two other instances might be cited. A large stove manufacturer was found cutting very small pieces from long lengths. These were eventually supplied, cut to size, from factory waste. The other is that of a large box factory which cut large quantities of cleats 1 in. by 1 in. by 7 in. from good lumber. They gladly secured these small pieces from nearby plants when they found that a dependable supply was to be had.

Some one may say that the same conditions do not hold in Canada and that it is extremely difficult, if not impossible, to find a market here that can take small blocks in large quantities. The "Canadian Woodworker" knows of one firm who manufacture their product from small pieces and are prepared to buy hardwood blocks full ⅞ thick, 4½ wide, and of random widths from 2 in. up, in carload lots. The name of this concern may be secured on application. This is only one instance. No doubt there are many others who would be glad to secure their raw material in small sizes.

Small Articles Might be Manufactured

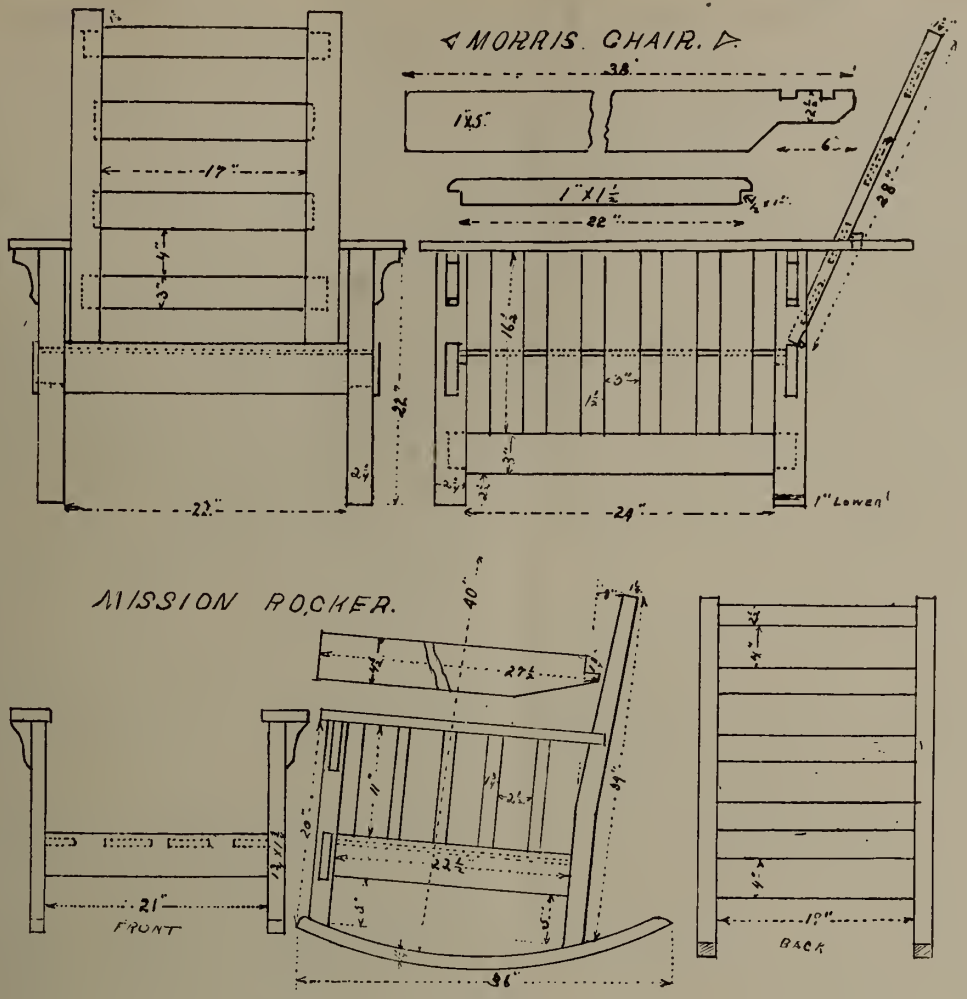
Other uses that might be suggested for a considerable part of this wood waste are the manufacture of such articles as staves, broom handles, small handles, dowels, clothes pins, boxes, laths, backs for scrubbing brushes, etc. If it was not deemed advisable to instal the equipment required to make some of these articles, it is just possible that some nearby broom or handle factory might welcome the opportunity to buy suitable blanks for their products. The same might apply to the other lines mentioned.

The manufacturers of wooden toys are finding a ready sale for their products and at prices that yield a fair profit. The demand for articles of this kind is well in excess of the supply. Perhaps the small pieces of wood that you are throwing out or burning could be made to return a certain amount of revenue and profit if some line of wooden toys were taken up.

Requires Considerable Initiative

Securing a return for sawdust and shavings is another and perhaps more difficult problem. Unless this waste is accumulating in such quantities as to be a nuisance and a fire menace, it might be well to make a practice of making a small charge for all shavings and sawdust that is taken away from the plant. Often some nearby industry is glad to secure such material for fuel and will haul it themselves and pay some nominal price, such as fifty cents a load. In addition a limited market usually exists in any town for these materials. The butcher uses sawdust on his floors, for smoking meats and fish and packing ice in storage. Others can be found who would probably use shavings for bedding, packing purposes, deadening walls in buildings or perhaps in the manufacture of some product.

It is advisable, if an attempt be made to dispose of the sawdust and shavings, to keep these two items separate, as it has been found that they can be disposed of more readily when not mixed. This requires separate cyclones and exhaust system, but such has often been found a profitable investment. Baled shavings may be shipped long distances, so any efforts made to secure a market for shavings should not be centered on the local field, to the total exclusion of a more distant openings.



Sketch showing details of Morris chair and rocker

Two Comfortable Easy Chairs

By R. J.

The two chairs shown in the accompanying illustration were recently designed and made up in walnut by the writer. While not claiming any special merit for them any more than that they are two substantial, well-constructed chairs, I am submitting them in the hope that they may prove of interest and, perhaps, assistance to some of the readers of this good publication.

In design, they are very plain, practically none but straight lines being employed. These chairs were made for service so that the details of construction are not skimpt. Numerous mortise and tenon joints insure that they will stand up under ordinary wear and tear. Wherever possible, glue blocks were placed as added reinforcements.

The finish consisted of a coat of light walnut filler, one of light shellac and several coats of good varnish. When thoroughly dry, the last coat was rubbed to an egg-shell gloss. The cushions were made of a material that harmonized with the other furnishings of the room and were filled with a good grade of curled hair. In the writer's opinion curled hair is the most satisfactory filling for upholstery that is on the market to-day.

The following stock list gives details of the pieces required for each chair:

Piece Bill for Morris Chair

4	posts	2¼" x 2¼"	22½" long
2	front and back rails	1 " x 4 "	28 " "
2	side rails	1 " x 3 "	27 " "
10	side slats	½" x 3 "	17½" "
2	arms	1 " x 5 "	38½" "
4	brackets	1⅛" x 2¼"	5 " "
2	cleats	1 " x 1 "	22 " "
5	seat slats	⅜" x 3 "	26 " "
2	back stile	1⅛" x 2 "	28½" "
4	rails	⅝" x 2½"	19½" "
1	back rest	¾" x 1½"	24½" "

Piece Bill for Mission Rocker

2	posts	1¾" x 1¾"	21 " "
1	pr. back posts	1¾" x 6 "	35 " "
1	front rail	⅞" x 4 "	23 " "
1	back rail	⅞" x 4 "	21 " "
4	back rails	⅝" x 2½"	22 " "
2	side rail	⅞" x 4 "	25½" "
10	side slats	½" x 2½"	12 " "
2	brackets	1⅛" x 2¼"	5 " "
2	arms	1 " x 4½"	27½" "
5	slats	⅜" x 6½"	25 " "
1	pr. rockers	1¾" x 6½"	36½" "

Some large plants in country districts might utilize all waste to advantage by converting it to electric current and lighting the surrounding district.

How One Per Cent. Tax Applies to Planing Mills

Considerable changes have taken place in the Government tax situation, so far as it relates to the retail lumber yards and planing mills, and sash and door factories. It was stated recently that all retail transactions were exempt, and it looked as if the retail lumbermen would not be called upon to collect the charge. This has all been changed and a late ruling received by the secretary of the Ontario Retail Lumber Dealers' Association from G. W. Taylor, Assistant Deputy Minister of Inland Revenue, Ottawa, says:

"In reply to yours of the 26th ult., I have to inform you that a firm operating a planing mill is classed as a manufacturer, and all sales are subject to the tax of 1 per cent. The tax of 1 per cent. on lumber is payable to the price f.o.b. shipment. without reduction or alterations on account of freight.

"If a retailer sells material to a contractor, such sale is subject to the tax of 1 per cent."

In a letter to the "Canadian Woodworker" Mr. Taylor says.

"All sales by manufacturers to wholesalers are subject to a tax of 1 per cent., and all sales by wholesalers to retail dealers or to other wholesalers, are also subject to the tax of 1 per cent. All persons owning a planing mill or sash and door factory are classed as manufacturers, and all sales by them are subject to the tax of 1 per cent. If a lumber merchant is a mill owner and takes a contract to supply material, all material supplied by him shall be subjected to 1 per cent."

It appears as if retail lumbermen will be subjected to the tax of 1 p. c. on nearly all transactions, as practically the bulk of their sales is to contractors or sub-contractors, who are regarded as retailers selling the consumer, as pointed out in Class 6 of the subjoined letter from Mr. Taylor, Assistant Deputy Minister of Inland Revenue.

Copies of the following have been sent out by the Canadian Lumbermen's Association, Ottawa, to its members, and also by the Ontario Retailer Lumber Dealers' Association to those belonging to that body.

(1) The tax is primarily one upon materials, and is not intended to be a tax upon labor. Labor used in the installation of materials is not taxed, but does apply to labor used in the manufacturing of materials.

(2) Art. 7 of the Resolution provides for a tax on one per cent (1%) to be collected on sales by manufacturers and wholesalers, this tax to be paid by the purchaser to the wholesaler or manufacturer at the time of sale.

(3) Contractors and sub-contractors will have to pay one per cent. (1%) tax on materials used by them.

(4) Products of the soil, such as sand, gravel, and unprocessed stone, are not taxed. Lime, cement and stone which is quarried, crushed or which passes through any process, come under the tax.

(5) Tax on materials on everything shipped or delivered on or after May 19th, 1920, unless it can be proven that the complete price was paid in advance of that date. Partial payment is not sufficient.

(6) Building contractors and sub-contractors, though technically manufacturers, are regarded for the purpose of the tax as retailers, selling the consumer. Tax is not chargeable on the amount of contract, either between sub-contractors and contractor or between contractor and owner.

(7) If a contractor or sub-contractor manufactures materials for his work, such as metal cornices, sash and door frames, iron failings, etc., he is required to pay tax on cost of manufacture, including labor. He is not required to pay tax on installation.

(8) Provincial and Dominion Government are both subject to the tax.

(9) Lumber jobbers are regarded as wholesalers and their sales are therefore subject to a one per cent. (1%) tax.

(10) Dealers who make sash, doors, etc., are manufacturers and the sales tax applies.

(11) Planing mills are manufacturers. Sales to wholesalers are subject to the tax, also to a further one per cent. tax when sold by wholesaler to contractor or consumer.
